MULTI-MEANS EFFORT FOR URBAN FLOOD CONTROL,
Wright-McLaughlin Engineers, Denver, Colo.
Kenneth R. Wright.
Paper presented at International Conference on Floods: Their Protection and Defense of the Soil, held by the Accademia Nazionale Dei Lincei, Rome, Italy, Nov 1969. 28 p, 24 ref.

Descriptors: *Flood control, *Planning, *Drainage systems, *Drainage engineering, Storm drains, Storm runoff, Drainage programs, Hydraulic structures, Water policy, Floodproofing, Flood protection.

Most urban areas are faced with a flood problem that receives little official recognition, the urban drainage problem. Urban drainage is usually very localized, although it is believed that damages due to urban drainage problems are equal to report flood losses. AN EFFECTIVE WAY TO DEAL WITH THIS PROBLEM IS BY A MULTIPLE MEANS EFFORT BASED ON A BASIC URBAN DRAINAGE POLICY. This policy should be formulated in light of various inputs; principles of urban drainage, hydrology and hydraulics of small urban basins, and accurate knowledge of urban drainage law. Urban drainage policy must also recognize that urban drainage is directly related to the total urban system and that when it is deficient, adverse effects occur in other subsystems. The planning process is based on the concept of two urban drainage systems. The initial drainage system, typically storm sewers, is designed to handle storm runoff expected to occur once every 2-10 years. The major drainage system is the area which must accommodate the 100-year runoff and includes both natural and artificial elements. Other specific aspects of urban drainage planning discussed are functions of storm sewers and streets, hydraulic structures, inlets and culverts, storage, and floodproofing. (Davis-Chicago)

4D. Watershed Protection

CONSERVATION OF NATURAL RESOURCES (SHORE EROSION).

Ohio Rev Code Ann secs 1507.01 thru 1507.13 (Page 1964), as amended, (Supp 1970).

Descriptors: *Ohio, *Beach erosion, *Shore protection, *Erosion control, Legislation, Legal aspects, Shores, Erosion, Construction, Structures, Permits, Riparian land, Financing, Rivers and Harbors Act, Administrative agencies, Natural resources, Water resources, Federal government, Lake Erie, Investigations, Navigable waters, Taxes, Mineralogy, Watercourses (Legal), Cost allocation, Contracts, Planning, Recreation.
Identifiers: Groins.

The Office of the Chief Engineer of the Department of Natural Resources will act as the erosion agency of the state for purposes of complying with the Rivers and Harbors Act. The Office will cooperate with the Federal Beach Erosion Board in conducting investigations and studies along the shores of Lake Erie with a view to erosion prevention and correction. Navigable waters, for the purpose of this section, means waters within the jurisdiction of the Board and any waterways within or adjacent to the state. No person will construct a beach or any other erosion arresting structure on the shores of Lake Erie without a permit from the Office. Funds for erosion projects will be obtained from permit sales and Lake Erie mineral leases. The Office may enter into agreements with any political subdivision for the purpose of constructing and maintaining projects to prevent, correct, and arrest erosion on specified beaches. Cost allocation formulas are provided for the different governmental subdivisions. The Chief Engineer in cooperation with the Division of Geological Survey, will prepare a plan for the prevention of shore erosion in the state. (Keith-Florida)

NONIONIC POLYMER FLOCCULATION OF DILUTE CLAY SUSPENSION,
Maryland Univ., College Park. Dept of Civil Engineering; and Federal Water Pollution Control Administration, Washington, D.C.
Francis B. Birkner, and J. K. Edzwald.
Journal of American Water Works Association, Vol 61, No 12, p 645-651, Dec 1969. 7 p, 6 fig, 5 tab, 21 ref.

Descriptors: *Water chemistry, *Flocculation, *Clays, Chemical precipitation, Coagulation, Ion exchange, Desilting, Water treatment.
Identifiers: Polyethylene oxide.

In a search for more efficient flocs, the chemical and physical mechanisms which are involved in the destabilization of kaolinite clay suspensions with a nonionic polymer, were examined. Polyethylene oxide was specifically tested as a flocculant. Solution pH and the type of counterion which predominates in the solution phase have a significant effect on the adsorption of polyethylene oxide onto kaolinite clay surfaces. Under conditions of constant ionic strength and at pH 8.3, twice as much polymer adsorption occurs when sodium ions are the predominant cation species in the solution phase than when calcium ions predominate. Adsorption is significantly reduced by raising the solution pH from 8.3 to 12 or by lowering it to 2.5. Polyethylene oxide was found to enhance turbidity removal when used in conjunction with sodium (Water I) or calcium (Water II) ions. (Knapp-USGS)
W70-03265

HYDROGEN SULFIDE ODOR THRESHOLD,
Pomeroy, Johnston and Bailey, Pasadena, Calif.
Richard D. Pomeroy, and Henry Cruse.
Journal of American Water Works Association, Vol 61, No 12, p 677, Dec 1969. 1 p, 1 tab.

Descriptors: *Odor, *Hydrogen sulfide, *Water quality, Laboratory tests, Water chemistry, Hydrogen ion concentration.
Identifiers: *Hydrogen sulfide odor determination.

Tests were made to ascertain the minimum concentration at which the odor of hydrogen sulfide in water can be detected. A panel of five observers was used, only one of whom had prior experience in odor testing. The odor threshold concentration of hydrogen sulfide in water at ordinary temperatures is in the range of 10 to 100 nanograms/liter (0.00001 to 0.0001 mg/l. It is noteworthy that the odor that one detects at very low hydrogen sulfide concentrations is musty or swampy, not recognizable as being related to the characteristic odor at higher concentrations. A musty odor is often complained of in anaerobic groundwaters. Hydrogen sulfide is a characteristic constituent of such waters, typically at concentrations below 0.1 mg/l. (Knapp-USGS)
W70-03275

DETERMINING pH OF STRIP-MINE SPOILS,
Forest Service (USDA), Berea, Ky. Northeastern Forest Experiment Station.
W. A. Berg.
US Forest Service Research Note NE-98, 1969. 7 p, 1 fig, 1 tab, 2 ref.

Descriptors: *Hydrogen ion concentration, *Acidic soils, *Strip mine wastes, *Analytical techniques, Mine wastes, Acidic water, Acid mine water, Water pollution sources.
Identifiers: Strip mine spoils.

In determining pH of strip-mine spoil, results with the LaMotte-Morgan method for determining soil pH (or the solution modification of this method) usually agreed fairly well with the results from using a pH meter, the recognized standard. Results obtained with the Soiltex and Hellige-Truog methods often deviated somewhat from the pH meter readings; and the Hydrion papers and the Kelway pH tester often gave results that were considerably different. (Knapp-USGS)

MEASUREMENT OF PHOSPHORUS IN WASTEWATER,
Belgrade Univ. (Yugoslavia) and Washington Univ., St. Louis, Mo. Dept. of Civil and Environmental Engineering.
Stevan G. Jankovic, Dee T. Mitchell, and James C. Buzzell, Jr.
Water and Sewage Works, Vol 114, No 2, p 471-474, 1967. 2 fig, 3 tab, 11 ref, appendix.

Descriptors: *Analytical techniques, *Sewage, *Phosphorus, Filtration, Industrial wastes, Sewage.
Identifiers: Orthophosphates, Phosphorus (Total), Dry-ashing, Polyphosphates, Murphy-Riley method, Domestic sewage.

Method of phosphorus determination in sewage waters in utilizing ascorbic acid as a reducing agent thereby avoiding complications caused by the use of stannous chloride is described. Neither pH value of the medium, nor additions of small amounts of oxidizing or reducing agents produced appreciable modification of results. Results comparable to dry-ashing were obtained by wet oxidation with potassium persulfate. The method is intended for analysis of domestic sewage and the results may be distorted by the presence of certain ingredients of industrial discharges. (Wilde-Wisconsin)

NEUTRON ACTIVATION ANALYSIS IN WATER RESOURCES MANAGEMENT IN NORTH CAROLINA,
North Carolina Water Resources Research Inst., Raleigh.
James R. Bohannon, Jr., Kuruvilla Verghese, and Jack N. Weaver.
Available from the Clearinghouse as PB-189 161, $3.00 in paper copy, $0.65 in microfiche. Report No 31, Water Resources Research Institute of The University of North Carolina, Dec 31, 1969. 142 p, 21 tab, 43 fig. OWRR Project A-0390-NC.

Descriptors: *Analytical techniques, *Water analysis, *Neutron activation analysis, Neutron spectroscopy, Neutron absorption.

A deliberate exploratory study and pilot plant type series of analysis were carried out to determine the applicability of neutron activation analysis (NAA) to water resources research and management in North Carolina. A review of the water pollution problems and programs was made to establish the background for determining this applicability. An explanation of the NAA technique is presented to prepare the reader for an understanding of the character of past water pollution programs and studies which employed the NAA technique. With this basic understanding established, applicability of NAA to North Carolina water resources problems was identified and specific exploratory analysis were performed. The categories of analysis were: the determination of baseline for trace elements in both virgin and contaminated rivers within the State, the establishment of minimum detection limits of specific trace elements of concern to the State by seeding the original water samples, and the performance of in-line process analysis for several industries. It was found that instrumental NAA could indeed be used to establish meaningful baselines for the water sources in the State, the minimum detectable limits were equal to or better than conventional methods in most cases, and NAA could serve a major role in the solution of water pollution problems and abatement within the desired criteria of routine, inexpensive and rapid analysis. The latter is particularly useful to the industries of the State in their efforts to recover wastes and to minimize their release by in-line process analysis. The detection problems and levels of specific types of pollutants; namely, pesticides, herbicides, and fungicides were explored. Specific recommendations were given on the future application of NAA to North Carolina water resources management. An extensive bibliography was developed. (Howells-North Carolina Univ)

OFFSITE RADIOLOGICAL SURVEILLANCE FOR PROJECT GASBUGGY, JUNE 1967-JULY 1968,
Southwestern Radiological Health Lab., Las Vegas, Nev.
John R. McBride, and Dixon Hill.
Radiological Health Data and Reports, Vol 10, No 12, p 535-546, Dec 1969. 12 p, 7 fig, 7 tab, 2 ref.

Descriptors: *Nuclear explosions, *Water pollution sources, *Radioactivity, *Monitoring, Sampling, Nuclear engineering, Underground, Natural gas, Water wells, Oil fields.
Identifiers: Project Gasbuggy.

Project Gasbuggy, an experiment to stimulate gas recovery by nuclear means, was conducted on December 10, 1967, as part of the Atomic Energy Commission's (AEC) Plowshare Program. The Public Health Service by Memorandum of Understanding with the AEC is responsible for a comprehensive offsite radiological safety program. The data obtained during this program have documented that no radioactivity was introduced into the environment as a result of the Project Gasbuggy detonation. Surveillance of the El Paso natural gas producing wells near the Gasbuggy experiment was conducted to insure that gas contaminated with radioactivity was not present. Water sampling coverage during the preshot and post-shot periods was provided by a network of 34 sampling stations. Fifteen of the sampling locations were within 20 miles of ground zero at open- and well-water sources, and 13 of the locations were milk cow sampling stations. Six of the network locations were municipal water systems located within approximately 120 miles from ground zero. (Knapp-USGS)
W70-03452

DETERMINATION OF MICROGRAMME QUANTITIES OF DISSOLVED SULPHATE IN SURFACE WATERS, SOILS AND PLANTS,
Commonwealth Scientific and Industrial Research Organization, St. Lucia (Australia). Cunningham Lab.
I. P. Little, R. Reeve, G. M. Proud, and Ann Lulham.
Journal of the Science of Food and Agriculture, Vol 20, No 11, p 673-676, 1969. 2 fig, 3 tab, 8 ref.

Descriptors: *Analysis, *Sulfur, Surface waters, Soil water, Plant tissues, Spectrophotometry, Analytical techniques.
Identifiers: *Dissolved sulphate.

A simple method for rapid determination of sulphate in surface waters and soil water extracts has an accuracy of 1 part per million. The sulphate is precipitated with a solution of lead nitrate in 40% ethanol. The residual lead is determined by atomic absorption spectrophotometer. Analysis of plant tissues requires conversion of sulphur to dissolved sulphate by combustion in an oxygen-filled flask. (Wilde-Wisconsin)

HYPOLIMNETIC HEATING IN CASTLE LAKE, CALIFORNIA,
California Univ., Davis. Dept. of Zoology.
Roger W. Bachman, and Charles R. Goldman.
Limnology and Oceanography, Vol 10, No 2, p 233-239, Apr 1965. 6 fig, 1 tab, 13 ref.

Descriptors: *Thermal stratification, *Solar radiation, *Hypolimnion, *Turbulent flow.
Identifiers: *Eddy conductivity.

Caculations were made of the coefficient of eddy conductivity by making use of a series of summer temperature profiles of a small mountain lake. An electrical resistance thermometer was used to measure water temperature at a station in the deepest portion of the basin. A minimal series included temperatures at 1-m intervals from the surface to 10-m and at 5-m intervals from 10-m. to the bottom. Solar radiation was measured with a pyrheliograph and pyrheliometer, water transparency was with a Secchi disc and light penetration was measured by a G.M. underwater photometer with various Schott light filters. The relatively high value obtained (0.0622g/cm/sec) prompted an evaluation of the role of direct solar heating in the hypolimnion using data on total daily solar radiation, the spectral curve of sunlight, and the light transmission properties of the lake water. An estimated 65-85% of the heating in the upper hypolimnion could be accounted for by direct solar heating. It is postulated that in Castle Lake, direct solar heating rather than turbulent mixing is responsible for the shape of the hypolimnetic thermal profile. (Guerrero-Vanderbilt)

QUALITY OF SURFACE WATERS OF SOUTH CAROLINA: A SUMMARY OF DATA, 1945-1968,
Geological Survey, Columbia, S.C.
T. Ray Cummings.
Copies of report may be obtained from U.S. Geological Survey, Water Resources Div, 2346 Two Notch Road, Columbia, S.C. 29204. Geol Surv Basic Data Open-file Report, 1969. 34 p, 4 fig, 1 plate, 3 tab, 15 ref.

Descriptors: *Water quality, *South Carolina, *Data collections, Hydrologic data, Water chemistry, Solutes, Mineralogy.
Identifiers: Water quality data.

Maximum and minimum values of dissolved substances and physical properties of surface water at 81 locations in South Carolina are tabulated. Most dissolved substances are in low concentration, and measured values of physical properties are low. At most sampling stations dissolved-solids content does not exceed 100 mg/l. South Carolina is divided into two water-quality zones, which generally correspond to the Piedmont province and Coastal Plain province of the State. Minor but distinct differences between water of these zones occur. Water of the Piedmont province contains slightly more dissolved solids, particularly silica, sodium, and bicarbonate, than does water from the Coastal Plain province. The pH of water in the Piedmont province is also slightly higher. The color of water, however, averages about 100 units higher in the Coastal Plain province than in the Piedmont province. (Knapp-USGS)

WATER QUALITY IN THE DRAINAGE AREA OF THE DELAWARE RIVER (DUTCH),
Rijksinstituut voor Zuivering van Afvalwater, Voorburg (Netherlands).
W. A. H. Brouwer.
H2O, Vol 2, No 17, p 400-402, Aug 21, 1969. 3 p, 2 fig, 1 photo, 1 map, 5 ref.

Descriptors: *Water quality, *Estuaries, *Delaware River, *Delaware River Basin Commission, *Water quality control, Estuarine fisheries, Estuarine environment, Regulation, Legislation, Legal aspects, Interstate, Water resources development, Planning, River basin commissions, Maryland, New Jersey, New York, Pennsylvania.
Identifiers: *Delaware River Basin.

The Delaware River drains a region of ample water resources. A multiplicity of water quality management problems exist encompassing protection of municipal and industrial water supplies, acid mine drainage control, recreation and water sports, saline waters encroachment in a tidal estuary, natural shellfish beds in Delaware Bay, maintenance and propagation of resident fish, passage of anadromous fish and the discharge and ultimate disposal of the generally treated wastes from 6.5 million people and numerous industries. In 1961 a compact gave rise to the Delaware River Basin Commission, formed by the four Basin States and the Federal Government. Part of the Commission's responsibilities in the maintenance of a Comprehensive Plan of water resource development, including water quality management. A 5-year study in the complex estuary provides a framework for decisions which will protect the desired uses as well as allow reasonable waste discharges. (Knapp-USGS)

IDENTIFICATION OF RETURN IRRIGATION WATER IN THE SUBSURFACE: WATER QUALITY,
Hawaii Univ., Honolulu. Water Resources Research Center.
Pedro A. Tenorio, Reginald H. F. Young, and H. Collins Whitehead.
Available from the Clearinghouse as PB-189 171, $3.00 in paper copy, $0.65 in microfiche. Hawaii Water Resources Research Center, Technical Report No. 33, Oct 1969. 90 p, 2 tab, 28 fig, 39 ref. OWRR Project B-012-HI.

Descriptors: *Groundwater, Nitrates, Dissolved solids, *Return flow.
Identifiers: *Irrigation return water, Pearl Harbor-Waipahu (Oahu), Kahuku (Oahu), Central Maui, West Maui.

A joint research effort was undertaken by the Water Resources Research Center and the Honolulu Board of Water Supply to investigate the physical and chemical characteristics of irrigation return water in Pearl Harbor-Waipahu, Oahu, which is an area used for tropical agriculture. The project was started in 1967 and was expanded in 1968 to include Kahuku, Oahu and Central and West Maui. Well samples and profile samples were obtained with a thief sampler in the Pearl Harbor-Waipahu area and composite samples were obtained mainly from pumping wells in other areas. In addition, both spring and stream waters in the Pearl Harbor-Waipahu area were analyzed for a number of inorganic constituents. Stream waters in the main study area were observed to contain appreciable quantities of nitrate, phosphate, bromide, bicarbonate, and fluoride. Similar trends were observed with the spring samples including increases of calcium, magnesium, silica, sulfate, and nitrate. Well waters from the main study area were evaluated according to Visher and Mink's index constituents, silica, sulfate, and nitrate, and other significant ionic compositions. General analysis of major constituents evidenced a cyclical trend in concentration, either related to seasonal rainfall and irrigation practices, or both. (WRSIC-Abstract)
W70-03430

OXYGENATION OF FERROUS IRON: THE RATE-DETERMINING STEP IN THE FORMATION OF ACIDIC MINE DRAINAGE,
Harvard Univ., Cambridge, Mass. Dept. of Applied Chemistry.
Philip C. Singer, and Werner Stamm.
Available from the Clearinghouse as PB-189 233, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report DAST-28, June 1969. 199 p, 63 fig, 10 tab, 122 ref, 6 append. FWPCA Contract PH 36-66-107. Program 14010.

Descriptors: *Acid mine water, *Oxidation, *Pyrite, *Iron bacteria, *Chemical reactions, Water chemistry, Mine acids, Water pollution sources, Acidic water, Reduction (Chemical), Hydrogen ion concentration, Oxidation-reduction potential, Sulfides, Iron.
Identifiers: Reaction kinetics.

The rate of oxidation of iron (II) by oxygen conforms to a relationship which is first-order in the concentrations of ferrous iron and oxygen, and second-order in the concentration of hydroxide ion, at pH values between 6.0 and 7.5. The reaction proceeds relatively rapid at pH values greater than 6.5; the half-time of the reaction is 4 minutes at pH 7.0, under a partial pressure of oxygen of 0.20 atmospheres at 25 deg C. The dependence of the oxidation rate on hydroxide concentration has been observed, in this study, at pH values as low as 4.5, where the half-time has increased to approximately 300 days. At lower pH values, the dependence of the reaction rate on pH becomes less marked until at pH values below 3.5, the oxidation proceeds at a rate which is independent of pH. Field results suggest that the observed rapidity of the reaction in acidic mine waters is apparently the result of microbial catalysis. The rate-limiting step among the reactions involved in the oxidation of iron pyrite and the production of acidity in mine drainage waters is the oxygenation of ferrous iron. Oxidation of iron pyrite is by a cyclical reaction involving the slow oxygenation of iron (II) to iron (III) followed immediately by the rapid reduction of iron (III) by pyrite, generating in turn more iron (II) and acidity. (Knapp-USGS)
W70-03434

A WATER MONITORING SYSTEM FOR PESTICIDES IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. Pesticide Residue Research Lab.
T. J. Sheets, M. D. Jackson, and L. D. Phelps.
Available from the Clearinghouse as PB-189 291, $3.00 in paper copy, $0.65 in microfiche. Progress Report No. 19, Water Resources Research Institute of The University of North Carolina, Feb 6, 1970. 105 p. OWRR Project A-021-NC.

Descriptors: *Pesticides, *Pesticide monitoring, *Water quality, *Pesticide residues, Insecticides, Herbicides, *Chlorinated hydrocarbons, DDT, TDE, DDD, Phenoxy herbicides, 2-4-D, 2-4-5-T, Trifluraline, Pollutants, Water, Sediment, Estuaries, Pesticide use estimates.
Identifiers: *Phenoxy acetates, *Water and sediment.

A procedure for monitoring surface waters in North Carolina for pesticides was devised and tested in the Tar-Pamlico River. Sites, positions in the river, frequencies, and kinds of samples were evaluated. Samples of sediment and water were routinely taken from the river and from selected sites in estuaries and sounds and analyzed by electron-capture gas chromatography for p,p'-DDT, p,p'-TDE, o,p-DDT, p,p'-DDE, and dieldrin. The p-value was evaluated as a method of confirmation. The low limits of detection of each of the pesticides were 10 ppt and 4 ppb for water and sediment, respectively. The percent positive values in sediment were 10 to 10,000 times greater than levels in water. Systems for sampling and analyzing water and sediment for chlorinated hydrocarbons, organic phosphates, phenoxy acetates, and trifluraline were outlined, and minimum personnel and equipment needs for operation of the monitoring system were listed.
W70-03437

A NEW POLLUTION PROBLEM,
Committee for Environmental Information, St. Louis, Mo.
Sheldon Novick.
Environment, Vol 11, No 4, p 2-9, May 1969. 8 p, 3 photo, 2 tab.

Descriptors: *Water pollution sources, *Pesticides, *Fungicides, Metal organic pesticides, Pesticide toxicity, Poisons, Public health.
Identifiers: Mercury compounds.

Mercury pesticides are widely used in agriculture and potentially can result in toxic residues in foods. These pesticides and fish contaminated by them have been banned in Sweden; the pattern of use in the U. S. is like that in Sweden before the ban. Mercury pesticides manufacturers, trade names, and national use of mercury pesticides are tabulated. It is recommended that mercury tolerances and concentration in water, air, and food be given thorough study. (Knapp-USGS)
W70-03456

USE OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES,
Northeastern Univ., Boston, Mass. Dept. of Civil Engineering.
Alvin S. Goodman, and Richard J. Tucker.
Available from the Clearinghouse as PB-189 293, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report No ORD-6, July 1969. 121 p, 17 fig, 10 tab, 71 ref, 4 append. FWPCA Grant No WP-01090, FWPCA Program No 16090.

Descriptors: *Water quality, *Water pollution control, *Mathematical models, Computer programs, Dissolved oxygen, Biochemical oxygen demand, Waste water treatment, Waste dilution, Statistical methods.
Identifiers: *Sensitivity analysis.

Mathematical models were utilized to study water pollution control programs in a river basin. Sensitivity analyses, with a steady state model, showed substantial variation of cost for sewage treatment, depending upon stream purification parameter selections. When actual parameters are less favorable than design values, quality standards may not be met. An unsteady state model was developed to trace a time profile at any specified station in terms of flow and quality as BOD, dissolved oxygen, coliforms, and chlorides while upstream discharge, water temperature, and solar radiation vary. A new empirical procedure was developed to route unsteady stream flow. The time varying model was used to investigate the effectiveness of treatment when the stream's assimilative capacity varies with distance and time. DO values are worse at times than the steady state value, and susceptibility to poorer conditions increases with higher BOD releases. (Knapp-USGS)

CHEMICAL AND DETRITAL FEATURES OF PALOUSE RIVER, IDAHO, RUNOFF FLOWAGE,
Eastern New Mexico Univ., Portales. Dept. of Biological Sciences.
Philip A. Buscemi.
Oikos, Vol 20, No 1, p 119-127, 1969. 3 fig, 3 tab, 30 ref.

Descriptors: *Runoff, *Groundwater, *Seston, *Sediments, Organic matter, Currents (Water), Water pollution sources, Surface runoff, Rainfall, Snowmelt, Surface waters, Streams, Hydrogen ion concentration, Iron, Magnesium, Nitrates, Phosphates, Algae, Detritus, Pulp wastes, Livestock, Idaho.
Identifiers: Tree bark, Charcoal, Algal growth, Stream concourse, Palouse River (Idaho)

Water and sediment samples were collected at four stations established on Palouse River, Idaho. Determinations included pH, nitrate, phosphate, iron, manganese, hardness, suspended detritus (drifting seston), and organic content of sedimentary deposits. The results show influence of rainfall, melt water, stream inflow, and mill pond on seston concentration. Variation in chemical composition of water indicated the effect of either melt water runoff or subterranean discharge. The increased pollution of water and sediment enrichment in organic matter were correlated with locations of lumber camps and cattle grazing. (Wilde-Wisconsin)

DISSOLVED ORGANIC MATTER IN AN ANOXIC FJORD, WITH SPECIAL REFERENCE TO THE PRESENCE OF MERCAPTANS,
Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography; and Washington Univ., Seattle. Dept. of Oceanography.
Donald D. Adams, and Francis A. Richards.
Deep-Sea Research, Vol 15, p 471-481, 1968. 3 fig, 6 tab, 27 ref.

Descriptors: *Organic matter, *Oxygenation, Anaerobic bacteria, Sea water, Test procedures, Separation techniques.
Identifiers: *Lake Nitinat (Vancouver Island), Anoxic waters, Mercaptans, Dissolved organic matter, Polar constituents, Solvent extraction, Thin-layer chromotography, Oxidation potential, Organic carbon, Desulfovibrio desulfuricans.

From 40 to 60% of dissolved organic carbon was recovered from acidified sea water by extraction with petroleum ether and ethyl acetate. Oxygen-bearing waters yielded 1.0-1.2 milligram/liter of dissolved organic matter whereas deoxygenated waters yielded 1.8-1.9 milligram/liter. Increase in the content of organic matter was accompanied by the presence of nonpolar and polar nonvolatile mercaptans. Tentatively identified sterols or sterol esters, choline-containing lipids, and ninhydrin-positive compounds were found in both oxygenated and anaerobic waters. Observations may have bearing upon the distribution of higher forms of life. (Wilde-Wisconsin)

Jerome O. Nriagu, and Carl J. Bowser.
Water Research, Vol 3, p 833-842, 1969. 4 fig, 5 tab, 12 ref.

Descriptors: *Pollutant identification, *Water pollution, *Lakes, Lake soils, Sedimentation, Diagenesis, Sediments.
Identifiers: *Lake Mendota (Wis), INA method, Magnetic microspherules, Lake muds, Sedimentation pattern.

Analyses of magnetic microspheric particles from the bottom mud of Lake Mendota, Wisconsin, suggest that these intrusions are by-products of either industrial or domestic activity. Washing the atmosphere, influent of streams, and urban runoff are possible channels of transportation. The profile distribution of these resistant spherules eliminates their extraterrestrial origin and documents the progressive pollution of the lake by man. (Wilde-Wisconsin)

PARTICULATE FRACTIONS IN WATER AND THE RELATIONSHIP TO AQUATIC MICROFLORA,
Ohio State Univ., Columbus. Dept. of Microbiology; and Ohio State Univ., Columbus. Aquatic Biology Lab.
Robert M. Pfister, Patrick R. Dugan, and James I. Frea.
International Association of Great Lakes Research, Proceedings 11th Conference Great Lakes Research, p 111-116, 1968. 6 fig, 2 tab, 11 ref.

Descriptors: Aquatic environment, Water quality control, Ecosystems, Biological communities, Detritus, Chemical properties, Interfaces, Adsorption, Electron microscopy, Biocontrol.
Identifiers: *Lake Erie, *Particulate fractions, *Microflora, Linear sucrose gradient, Beckman tube cutting device, Membranous organelles, Streptomyces, Micromonospora, Pseudomonads, Environmental contaminants, Biological reactions

Water samples from a 15-foot depth of Lake Erie and from the surface of Sandusky River, Ohio, were subjected to gradient centrifuging. Different submicroscopic fractions of suspended particulates (mineral and detritus) were investigated by electron microscopy and examined for their ability to influence biological reactions. Addition of the particulate fraction 0.3 micron and larger to a carbon-free salts medium caused a significant increase in the biomass of Micromonospora and Streptomyces. An aggregation of submicroscopic particles of magnesium silicate with an exocellular polymer, produced by a floc-forming pseudomonad, was demonstrated. A system of ecological control of pollution involving a buildup of larger aggregates by association of inorganic particles and organisms is postulated. (Wilde-Wisconsin)

HEATED WATER FLOW FROM CHANNELS INTO IMPOUNDMENTS,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
H. Stefan, and F. R. Schiebe.
ASCE National Water Resources Engr Meeting, Memphis, Tenn, Jan 26-30, 1970. Preprint, 39 p, 19 fig.

Descriptors: *Heated water, *Heat flow, *Impoundments, Lakes, Reservoirs, *Thermal pollution, Hydraulic models, Density currents, Stratified flow, Turbulence, Jets, Temperatures, Froude number, Thermal stratification.

The physical aspects of the flow of heated water from open channels into large, deep impoundments, such as lakes and reservoirs, are considered. The data were obtained in a number of laboratory experiments. Both the outlet channel and the receiving tank had rectangular cross-sections, but the tank was more than ten times wider and deeper than the channel. Measurement of local velocities proved to be difficult, and the tethered sphere was developed. Local temperatures were also measured and surface spreading patterns were recorded photographically. Densimetric Froude numbers and Reynolds numbers at the outlet ranged from 0.6 to 7.2 and from 1500 to 9600, respectively. Some results were presented graphically, but analysis was minimal. USE OF RIVER MODELS IN COOLING CIRCULATING WATER STUDIES,
Worcester Polytechnic Inst., Mass.
Leslie Hooper, and Lawrence Neale.
Journal Boston Society of Civil Engineering, Vol 44-45, p 356-365, 1957-1958.

Descriptors: *Model studies, *Hydraulic models, *Water cooling, Heat transfer, Temperature, Thermal powerplants.

Model tests are used to outline the nature of the difficulties involved when a relatively small river is called upon to supply the cooling water for a modern steam unit and to suggest any means of reducing the effects both upon the unit performance and the river. Considerations in the design of a model to study the density and temperature effects of the cooling water problem in a stream has been made. Reynolds number, distortion, density effects, temperature and heat transfer have been analyzed. The translation of the tem-

perature rise and heat transfer effects from the model to the prototype and the question whether any of the cold water that is being provided upstream in the river manages to get by the plant without bearing its full load of heat has been treated. Conclusions were: (a) The recommendations in the design of cooling water systems is that the plant should be located on the outside bank of a stream. (b) It is believed that a river model can be used to provide design information on the temperature increase that can be expected for various flow conditions in the river and circulating water demands of a steam powerplant. (Guerrero-Vanderbilt)

5C. Effects of Pollution

SOME WATER QUALITY ASPECTS OF THE UPPER ROANOKE RIVER BASIN WITH SPECIAL EMPHASIS ON TEMPERATURE,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
Kenneth B. Cumming, and R. Don Estes.
Partly supported by Bur of Sport Fisheries and Wildlife. Available from the Clearinghouse as PB-189 170, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Center Bulletin 23, Virginia Polytechnic Institute, Sept 1969. 66 p, 16 fig, 3 tab, 17 ref, 11 append. OWRR Project No A-012-VA.

Descriptors: *Pumped storage, *Water temperature, *Thermal pollution, *Virginia, Stratification, Forebays, Water pollution control, Eutrophication, Environment, Aquatic habitats, Striped bass, Fisheries, Water quality, Water management (Applied), Regulation.
Identifiers: Roanoke River (Va).

A study was undertaken by the Virginia Cooperative Fishery Unit on the effects of the Smith Mountain pumped storage project. The study documents some of the before and after water quality features of the Roanoke River in the area of the pumped storage operation. Until now, there has been only a limited amount of data and little evaluation of the effects of such projects upon downstream water quality. While emphasis has been placed on water temperature regimes above, in, and below the project, there is considerable information on water chemistry and some of the operating dynamics which affect water quality. The research is of particular interest because downstream water quality could affect the resident striped bass population of Kerr Reservoir. There appears to be a trend toward deepening of the summer epilimnion since 1965. The schedule of water releases has substantially changed the flow pattern in the river without altering the average volume of discharged water. This variable flow has led to variable temperatures on a weekly basis and there is inferred a variable water chemistry because of the low flow during weekends. Temperature profiles are plotted and the data used to construct them are tabulated. (Knapp-USGS)

FISH AND POWER PLANTS,
New York State Dept. of Conservation, Albany. Div. of Marine and Coastal Resources.
Albert C. Jensen.
The Conservationist, New York State Conservation Department, Vol 24, No 3, p 2-5, Dec 1969-Jan 1970. 4 p, 2 fig, 2 photo.

Descriptors: *Hudson River, *Estuarine environment, *Pumped storage, Hydroelectric plants, Water temperature, Fish, Ecology, Aquatic habitats, Environmental effects, Fisheries, New York.
Identifiers: Hudson River Estuary, Storm King Mountain, Cornwall (NY).

A biological survey was made to predict the effects of the proposed Storm King Mountain pumped storage hydroelectric plant on the ecology of the Hudson River Estuary. Large numbers of eggs, larvae, and young striped bass would be withdrawn by the proposed hydroelectric plant. However, the eggs and young fish that would be withdrawn would be but a small percentage of the total number of each of the life stages of striped bass present in the estuary. Approximately 2.8% would be subject to withdrawal. Substantial numbers of blueback herring, alewife, tomcod and white perch, small enough to pass through the screens, also would be withdrawn seasonally but that because of the varying distribution of the species in the estuary, the effect of losses by the operation of the plant probably would be minimal. Operation of additional plants--power, manufacturing or other--that require large volumes of water could, in combination with the proposed Cornwall plant, destroy sufficient numbers of eggs and larvae of fishes to adversely affect subsequent populations. These effects could be particularly severe if the plants were built in areas of heavy fish concentrations. The proposed pump-storage hydroelectric plant at Cornwall would not have a significant adverse effect on the populations of striped bass and shad in the Hudson River. (Knapp-USGS)

STUDIES RELATING TO WATER MINERALIZATION AND HEALTH,
Bureau of Water Hygiene, Cincinnati, Ohio.
Elliott F. Winton, and Leland J. McCabe.
Journal of American Water Works Association, Vol 62, No 1, p 26-30, Jan 1970. 5 p, 2 fig, 4 tab, 36 ref.

Descriptors: *Water quality, *Public health, *Human diseases, *Human pathology, *Hardness (Water), Mortality, Trace elements, Calcium, Magnesium, Chemical properties, Water softening.
Identifiers: Heart disease-water quality relations.

Recent studies on the relation of heart disease to water quality are reviewed. Correlation is sufficient to suggest more definitive studies to resolve the question. Calcium, magnesium, and total hardness contents of drinking water seem to be inversely correlated with coronary heart disease death rates in England, the United States, and Asian countries. Several specific questions are listed for experimental and statistical investigation. (Knapp-USGS)

A RECONNAISSANCE OF THE QUALITY OF WATER IN LAKE DICIE AND WEST CROOKED LAKE NEAR EUSTIS, FLORIDA,
Geological Survey, Tallahassee, Fla.
Darwin Knochenmus.
Geol Surv Open-file Report, Sept 1969. 10 p, 1 fig, 1 tab.

Descriptors: *Water quality, *Lakes, *Eutrophication, *Florida, Aquatic productivity, Water pollution sources, Septic tanks, Storm drains, Nutrients, Urbanization, Storm runoff.
Identifiers: Eustis (Fla), Crooked Lake, Lake Dicie.

A study was made of 2 lakes near Eustis, Florida to determine the cause of algal blooms in one of them while the other had no blooms. Lake Dicie is smaller, shallower, and thus at times probably warmer than West Crooked Lake. Significant land use differences in their drainage basins exist; private dwellings serviced by septic tanks comprise 50% of the drainage area of Lake Dicie as compared to only 20% of the drainage area of West Crooked Lake. The ratio of drainage area to lake surface is approximately 24:1 for Lake Dicie (after installation of a storm drain) whereas the ratio is only 10:1 for West Crooked Lake. The higher concentration of nutrients in Lake Dicie seems to be related to the larger drainage area ratio and the increase in nutrient and water inflow through the storm drain, as well as to the many septic tanks in the Lake Dicie drainage basin. Many other small lakes and ponds in Lake County which receive street drainage have algal blooms. (Knapp-USGS)

ALGAL GROWTH AND PRIMARY PRODUCTIVITY IN A THERMAL STREAM,
Washington Univ., Seattle. Dept. of Zoology.
John G. Stockner.
Journal Fisheries Research Board of Canada, Vol 25, No 10, p 2037-2058, 1968. 13 fig, 7 tab, 25 ref.

Descriptors: *Primary productivity, *Algae, *Thermal water, Periphyton, Biomass, Physiological ecology, Cyanophyta, Diffusion, Respiration, Phosphates, Ecosystems, Organic matter, Water pollution, Thermal pollution, Streams, Nutrients, Light, Washington, Water chemistry, Oxygen, Hydrogen ion concentration, Photosynthesis, Alkalinity, Nitrates, Conductivity, Chlorides, Carbonates, Sulfates, Bicarbonates, Potassium, Iron, Sodium, Calcium, Magnesium, Phosphorus.
Identifiers: *Algal growth, *Thermobiology, *Diurnal oxygen curves, Calorimetry, Solarimetry, Yellowstone National Park, Mt Lassen National Park, Mt Rainier National Park, Ohanapecosh Hot Springs (Wash), Schizothrix, Phormidium, Winkler technique, Oxygen electrodes, Atomic absorption spectrophotometry, Total dissolved solids, Hedriodiscus, Caloparyphus.

Trophic relationships in flowing water are not as well understood as those in more static environments. Because of their relatively constant conditions, streams draining thermal springs are ideal sites for such studies. Estimates of primary production and respiration of blue-green algae in stream draining one of the Ohanapecosh Hot Springs, Washington, were obtained throughout 1966 from daily oxygen curves. Rates of gross primary productivity were slightly higher than published values from other aquatic ecosystems, but were less than recent estimates, derived from measurement of radiocarbon uptake from other thermal waters. Calculated ratios, production/respiration, were in range 1.1-5.0. As growing season progressed, photosynthetic effects on ionic composition of effluent water, as well as morphological changes in algal mat, were observable. Changes in algal biomass during 1964-1965, together with growth rates in denuded areas by two methods of harvest were studied. Accelerated growth occurred in May and June, associated with maximal values for primary production, whereas growth was minimal in winter. Significant differences in growth between years were attributed to differences in harvesting methods, and to production of auto-inhibitory toxins by senescent cells in mature mat. Annual energy budget for mat is derived from 1966 estimates. (Eichhorn-Wisconsin)

MICROBIOLOGY OF SEWAGE LAGOONS-EFFECTS OF INDUSTRIAL WASTES ON LAGOON ECOLOGY,
North Dakota Univ., Grand Forks. School of Medicine.
John W. Vennes.
Available from the Clearinghouse as PB-189 159, $3.00 in paper copy $0.65 in microfiche. Completion Report, Aug 1969. 82 p, 3 fig, 41 tab, 35 ref. OWRR Project No A-016-NDAK.

Descriptors: *Microbiology, *Sewage lagoons, *Industrial wastes, Sewage treatment, North Dakota, Coliforms, Oxidation lagoons, Biochemical oxygen demand, Photosynthesis, Hydrogen sulfide, Lakes, Algae, Enteric bacteria, Methane bacteria, Chemical analysis, Water pollution, Chlorella, Scenedesmus.
Identifiers: *Microbial ecology, Purple sulfur bacteria, Population equivalents (Wastes), Red River Valley (North Dakota), Sulfate reduction, Potato processing wastes, Cheese manufacturing wastes, Starch manufacturing wastes, Water quality standards, Grafton (ND), Lakota (ND), Harvey (ND), Chromatium vinosum, Thiocapsa floridana, Enterococci, Park River (ND), Sheyenne River (ND), Thiopedia.

State and federal legislation, regulating effluent discharge to natural waters, is such that food processing industries in North Dakota must discharge wastes into municipal lagoons resulting in frequent overloads of these systems. Lagoon at Grafton, designed for 5-day biochemical oxygen demand (BOD-5) of 30 pounds/acre per day, receives 240, largely from two potato processing plants. Increased loadings favor (as dominant microorganisms in these lagoons) the purple sulfur bacteria (PSB), which photosynthetically utilize hydrogen sulfide and various volatile organic acids for growth. Most reduction in BOD-5 at Grafton is attributable to three genera of PSB: Chromatium, Thiopedia, Thiocapsa. Increased loading does not significantly multiply numbers of enteric organisms here. A natural lake, used for sewage stabilization in Lakota, receives whey; it recovers to an algal phase during summer, and shows no increase in numbers of enteric organisms. At Harvey, an aerated continuous discharge lagoon, receiving domestic wastes and intermittent creamery wastes, reduces BOD-5 to near stream levels, but cannot reduce coliforms to acceptable numbers. If the latter treatment is to succeed in northern climates, consideration must be given to longer detention times, greater delivery of oxygen to cells, chlorination, or reevaluation of stream standards. EFFECTS OF ENDRIN ON BLOOD AND TISSUE CHEMISTRY OF A MARINE FISH,
Bureau of Sport Fisheries and Wildlife, Highlands, N.J. Sandy Hook Marine Lab.
Ronald Eisler, and Philip H. Edmunds.
Transactions of the American Fisheries Society, Vol 95, No 2, p 153-159, Apri 1966. 4 fig, 5 tab, 28 ref.

Descriptors: *Chemistry, *Marine fish, *Endrin, Insecticides, Temperature, Salinity, Hydrogen ion concentration, Mortality, Colorimetry, Spectroscopy, Sodium, Potassium, Calcium, Chlorides, Ureas, Magnesium, New Jersey, Weight, Length, Eels, Killifishes, Mullets, Silversides, Guts, Proteins.
Identifiers: *Blood, *Tissue, Puffers, Sphaeroides maculatus, Hemoglobin, Liver, Serum, Chloresterol, Gamma-globulin, Zinc, Gill tissue, Sandy Hook Bay (NJ), Anguilla rostrata, Fundulus heteroclitus, Fundulus majalis, Pomatomus saltatrix, Pseudopleuronectes americanus, Mugil cephalus, Syngnathus fuscus, Oral membrane, Kidneys, Menidia menidia.

Adult northern puffers, Sphaeroides maculatus, were exposed to graded concentrations of endrin, a chlorinated hydrocarbon insecticide, at 20C, 24 parts/thousand salinity and pH 8.0. All animals subjected to 10.0 parts per billion (ppb) of endrin died within 24 hours. At concentrations of 1.0 ppb of endrin, or lower, no mortality occurred within 96 hours. Blood and tissue samples from fish surviving the 96-hour exposure were analyzed by photoelectric colorimetry and atomic absorption spectroscopy. Mean hemoglobin content and relative liver size of puffers exposed to endrin concentrations of 1.0, 0.5, 0.1, or 0.05 ppb did not significantly differ from controls. Although no meaningful changes in serum chloride levels, gamma globulin, and uric acid were found, concentrations of sodium, potassium, calcium, and chloresterol in serum were consistently higher in experimental animals than controls. Concentrations of sodium, potassium, calcium, magnesium, and zinc in livers of test animals were consistently lower. Concentrations of same cations in gill tissue fluctuated widely. Exposure to sublethal concentrations of endrin impaired liver functions, evidenced by transfer of major cations from hepatic tissue into serum and by elevated serum cholesterol. (Jones-Wisconsin)

A LABORATORY METHOD FOR THE STUDY OF MARINE BENTHIC DIATOMS,
Oregon State Univ., Corvallis. Dept. of Botany.
C. David McIntire, and Barry L. Wulff.
Limnology and Oceanography, Vol 14, No 5, p 667-678, 1969. 6 fig, 4 tab, 20 ref.

Descriptors: *Marine algae, *Diatoms, *Benthic flora, Light intensity, Biomass, Distribution, Ecosystems, Population, Oregon, Intertidal areas, Physiological ecology, Littoral, Estuaries, Photosynthesis, Respiration, Pigments, Chlorophyll, Temperature, Oxygen, Salinity.
Identifiers: Desiccation, Yaquina Bay (Ore), Carotenoids, Species, Diversity index, Achnanthes, Actinoptychus, Amphipleura rutilans, Amphora, Aulacodiscus, Bacillaria, Biddulphia, Chaetoceros, Cocconeis, Coscinodiscus, Dimerogramma, Diploneis, Eunotogramma, Fragilaria, Gomphonema, Gyrosigma, Melosira, Navicula, Nitzschia, Skeletonema, Plagiogramma, Pleurosigma, Rhaphoneis, Rhoicosphenia, Surirella, Synedra.

Effects of light intensity and exposure to desiccation on vertical distribution and growth of marine benthic diatom populations were investigated in a laboratory model ecosystem and respirometer chamber. Diatom flora developed was similar to that from field stations in lower Yaquina Bay, Oregon. Vertical distribution of many species was closely related to light intensity and period of exposure to desiccation. Biomass accumulated rapidly on substrates subjected to high light intensities without exposure to desiccation. Communities acclimated to various light intensities and period of desiccation responded differently to changes in light intensity in respirometer chamber. Experimental results show that laboratory apparatus described can be useful in study of simplified intertidal communities. System provides some laboratory control over salinity, light intensity, tidal cycle, and probably temperature. Movements and grazing activities of small marine invertebrates could be studied. It is emphasized that use of such laboratory ecosystems is subject to certain limitations resulting from simplifications of nature. Laboratory ecosystems are best used to gain information to supplement and help understand concurrent observations in the field. (Jones-Wisconsin)

TISSUE CHANGES IN PUFFERS EXPOSED TO METHOXYCHLOR AND METHYL PARATHION,
Bureau of Sport Fisheries and Wildlife, Highlands, N.J. Sandy Hook Marine Lab.
Ronald Eisler.
Bureau of Sport Fisheries and Wildlife, Wash, DC. Technical Paper 17, Sept 1967. 15 p, 6 fig, 6 tab, 37 ref.

Descriptors: *Insecticides, *Marine fish, Mortality, Sodium, Potassium, Calcium, Magnesium, Iron, Enzymes, Estuarine environment, NJ, Temperature, Spectrophotometry, Gonads, Length, Weight, Proteins, Electrophoresis, Salinity, Hydrogen ion concentration, Crustaceans.
Identifiers: *Tissue changes, *Puffers, *Methoxychlor, *Methyl parathion, Blood, Serum, Zinc, Liver, Gills, Biocides, Sandy Hook Bay (New Jersey), Muscle, Gill arch, Densitometric, Starvation, Biochemical profiles, Hemoglobin, Hematocrit, Erythrocyte.

Puffers were exposed to either 30 parts per billion (ppb) methoxychlor, 20,200 ppb methyl parathion, or a combination of 15 ppb of methoxychlor and 10,100 ppb of methyl parathion. These concentrations produced approximately 5% mortality in 96 hours under experimental conditions. Tissues from each group were analyzed for blood and serum constituents and for sodium, potassium, calcium, magnesium, zinc, and iron. Puffers in 30 ppb methoxychlor remained active as controls, ate readily, and experienced no significant mortality. No statistically significant differences at 0.01 level were observed between methoxychlor-exposed puffers and controls for parameters investigated. Groups exposed to methyl parathion alone, or to methyl parathion in combination with methoxychlor, refused to eat, were sluggish, and after 96 hours, exhibited a rapid increase in mortality. Survivors, compared to controls, had less hemoglobin, erythrocytes, lower hematocrit, inhibition of serum esterase enzymes, less magnesium in liver, and less zinc in liver and gill filament; differences were significant at 0.01 level. Profiles were based on effects of each insecticide on blood and tissues. Visual patterns provided by profiles suggest means of identifying unfavorable environmental conditions before appearance of obvious morphological or physiological changes. (Jones-Wisconsin)

LABORATORY STUDIES OF PERIPHYTON PRODUCTION AND COMMUNITY METABOLISM IN LOTIC ENVIRONMENTS,
Oregon State Univ., Corvallis. Pacific Cooperative Water Pollution and Fisheries Research Labs.
C. David McIntire, and Harry K. Phinney.
Ecological Monographs, Vol 35, No 3, p 237-258, Summer 1965. 15 fig, 12 tab, 54 ref.

Descriptors: *Periphyton, *Productivity, *Metabolism, *Lotic environment, Ecosystems, Primary productivity, Energy, Respiration, Light intensity, Temperature, Carbon dioxide, Seasonal, Biomass, Organic matter, Chlorophyll, Export, Dissolved oxygen, Photosynthesis, Hydrogen ion concentration, Bicarbonates, Alkalinity, Diatoms, Cyanophyta, Chlorophyta, Molecular structure, Chemical analysis, Oxygen, Turbidity, Copepods, Oligochaetes, Natural streams, Dissolved solids.
Identifiers: Community, Carotenoids, Total solids, Particulate, Phormidium retzii, Synedra ulna, Oedognium, Light-adapted, Shade-adapted, Ulothrix, Melosira varians, Cymbella, Epithemia, Navicula, Anabaena, Tendipes, Calopsectra, Polypedilum, Brilla, Baetis, Callibaetis, Paraleptophlebia, Ameletus, Cinygmula, Epeorus, Compensation point.

Studies of periphyton production and community metabolism in lotic environments were made in laboratory streams and with a photosynthesis-respiration chamber. Curves related illumination intensity to primary production in 'light-adapted' and 'shade-adapted' periphyton communities. In the former, primary production was continuously enhanced at illumination intensities exceeding 1000-foot-candles by increasing molecular carbon dioxide supply to a concentration of 45 milligrams/liter; no significant enhancement occurred in shade-adapted community. Gross production in laboratory streams was slightly greater than normally reported for eutrophic lakes and oceanic

waters and more characteristic of the least-productive flowing water systems, within the value range for natural environments at similar periods. Efficiency of fixation of usable light energy as organic matter was 15.1% in the light-grown community and 18.3% in the shade-grown. Laboratory community efficiencies were higher than estimated for most natural ecosystems. Chlorophyll a content was well within the range of values reported for several types of natural communities. Laboratory gross primary production-chlorophyll a ratios varied from 0.2 to 1.4 milligrams oxygen/hour per milligram chlorophyll a. The community, under higher light intensity, was reasonably stable by end of third month; shadegrown community succession was slower. (Jones-Wisconsin)

ENVIRONMENTAL AND NUTRITIONAL REQUIREMENTS FOR ALGAE,
Scripps Institution of Oceanography, La Jolla, Calif.
Osmund Holm-Hansen.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 98-108. 37 ref.

Descriptors: *Algae, *Nutrient requirements, *Environmental effects, Biomass, Phytoplankton, Zooplankton, Red tide, Vitamins, Carbon, Hydrogen, Oxygen, Nitrogen, Sulfur, Phosphorus, Potassium, Magnesium, Calcium, Iron, Boron, Copper, Molybdenum, Cobalt, Manganese, Sodium, Chlorine, Productivity, Eutrophication, Photosynthesis, Time, Dissolved solids, Cyanophyceae, Sewage effluents, Ions, Chemical properties, Enzymes, Light intensity, Temperature, Carbohydrates, Lipids, Diatoms, Oceans, Physiological ecology.
Identifiers: Ciliate, Photoautotrophic, Endosymbiotic, Growth factors, Vanadium, Macronutrient, Micronutrient, Zinc, Silicon, Bromide, Iodine, Adenosine triphosphate, Selenastrum, Particulate fraction, Algal strains, Euphotic zone, Morphology, Cytology.

Adenosine triphosphate, in a sensitive analytical method, is useful in estimating total biomass. Essential macronutrient elements are: carbon, hydrogen, oxygen, nitrogen, sulfur, phosphorus, potassium, magnesium, and calcium. Essential micronutrient elements are: iron, boron, zinc, copper, molybdenum, manganese, cobalt, sodium, and chlorine. Many diatoms need silicon for growth; whether vanadium, bromine, and iodine are sometimes essential is unknown. The only known organic nutrients important for various algae, are vitamins B-1, B-12, and biotin. In productivity studies of natural waters and eutrophication, the potential capacity of water to support phytoplankton should be known; also which element (s) is limiting to algal growth. Data from enrichment experiments are analyzed. Bottle tests with selected algal strains indicate by productivity, carrying capacity of water. This 'growth potential' serves as a guideline in eutrophication problems and sewage treatment. Physiological adaptation of species to environment is significant; nutrient deficiency is expected to alter cell chemical composition or enzymatic activity, or concentration. Open-system chemostat techniques make possible determination of substrate concentration permitting maximum growth and prediction of productive capacity of species for different water masses. Heterotrophy, or uptake of organic solutes by plant cells, is significant. (See Vol. 3, No. 7, Field 5C, W70-02775). (Jones-Wisconsin)

PHYSIOLOGICAL AND REGULATORY ASPECTS OF HETEROTROPHY IN ALGAL FLAGELLATES: CONDITIONALLY EXPRESSED CHARACTERISTICS,
California State Coll., Hayward. Dept. of Biological and Health Sciences.
Stanley Scher.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkely, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 117-140. 4 fig, 9 tab, 85 ref.

Descriptors: *Physiological ecology, *Algae, *Biological properties, Organic compounds, Nutrition, Photosynthesis, Environmental effects, Metabolism, Enzymes, Cytological studies, Eutrophication, Chlamydomonas, Dinoflagellates, Ochromonas, Carbohydrates, Amino acids, Hydrogen ion concentration, Chelation, Inhibition, Carbon radioisotopes, Water pollution effects, Vitamins.
Identifiers: *Heterotrophy, *Flagellates, *Regulatory biology, Thermobiology, Photobiology, Cytochemistry, Algal growth, Carbon sources, Nitrogen sources, Buffers, Biosynthesis, Metabolites, Euglena gracilis, Eucaryotes, Chlamydobotrys, Photoautotrophy, Dissolved organic matter, Phosphorus sources, Analog compounds, Radiocarbon uptake technique, Repression, Chloroplasts, Cellular organelles, Mitochondria, Auxotrophy.

Evidence mounts of utilization, by photoautotrophic algae for growth, of various exogenous organic compounds of low molecular weight dissolved in the hydrosphere. Such heterotrophy may take various forms: organic compounds may serve as intracellular carbon, nitrogen, and phosphorus sources; as hydrogen donors for carbon dioxide fixation or nitrite reduction; or as buffers and chelators. Utilizable carbon and nitrogen sources probably serve to control cellular growth and reproduction by repression of the synthesis of inducible enzymes, or by feedback inhibition of enzymes operating in biosynthetic pathways. Recent evidence suggests that such controls may operate directly on algal chloroplasts and mitochondria. Because heterotrophy may be influenced by environmental characteristics, such as non-optimal pH or supraoptimal temperature, it has been termed latent or conditionally-expressed auxotrophy. Information on heterotrophy is illustrated with evidence accumulated from study of various strains of the green alga, Euglena. Large and varied fractions of dissolved organic matter found in eutrophic waters suggest that heterotrophic phenomena may be important. Changes away from optimal conditions may limit population growth of eucaryotes via emergence of auxotrophy or failure of photosynthetic mechanisms, or community structure may be changed because of competition of algae with heterotrophic bacteria. (See Vol 3, No 7, Field 5C, W70-02775). (Eichhorn-Wisconsin)

LAKE MICHIGAN BEACH SURVEY 1968.
Illinois State Sanitary Water Board, Springfield.

Illinois State Sanitary Water Board, Report to 76th General Assembly, Feb 1969. 40 p, 3 ref, 7 tab, 18 fig.

Descriptors: *Water quality, *Lake Michigan, *Illinois, *Water pollution, *Beaches, Recreational facilities, Bacteria, Coliforms, Water pollution sources, Phosphates, Surfactants, Ammonia, Hydrogen ion concentration, Phenols, Thermal pollution.
Identifiers: Lake County, Cook County, Waukegan (Ill), Chicago.

The 1968 Sanitary Water Board monitoring program indicated that portions of Lake Michigan inshore waters failed in many cases to meet water quality criteria. Shore water on Illinois beaches frequently failed to meet bacteria criteria. Unacceptably high bacterial counts were typical of Lake County beaches and Cook County beaches near major recreational boat harbors. All beaches failed to meet criteria for phosphates and surfactants (MBAS). Concentrations of ammonia nitrogen increases in a northerly direction. Two-thirds of Lake County beaches failed to meet ammonia criteria while only two of nineteen failed to meet the criteria in Cook County. All beaches met the requirements for temperature, phenol-like substances, cyanides (with one sample exception) and pH (also with a single sample exception). The discharge of polluted water into Lake Michigan from the Chicago area, as the result of a severe rainstorm on 16 August 1968, did not significantly lower the bacterial quality of the Chicago beaches, with the exception of a two-day effect on beaches near the mouths of the Chicago and Calumet rivers. The beaches of the lowest quality were those in Lake County. This was largely a result of the overloaded Waukegan sewage treatment plant, the industrial waste effluent discharges, and the effluent from the five small primary sewage treatment plants operated by the North Shore Sanitary District. CLEANING OIL CONTAMINATED BEACHES WITH CHEMICALS, A STUDY OF THE EFFECTS OF CLEANING OIL CONTAMINATED BEACHES WITH CHEMICAL DISPERSANTS.
Federal Water Pollution Control Administration, Edison, N.J. Northeast Region Research and Development Program.

Available from the Clearinghouse as PB-189 172, $3.00 in paper copy, $0.65 in microfiche. FWPCA Water Pollution Control Research Series, DAST-27, Aug 1969. 22 p, 3 tab, 19 fig, 7 ref. FWPCA Program 15080 FHS 08/69.

Descriptors: Beach, *Cleaning, Detergent, *Emulsifier, Erosion, Oil, *Oil wastes, Water pollution, Quicksand, Sand.

Oil-dispersing chemicals were treated for cleaning persistent-type crude oil from experimentally contaminated New Jersy coastal beaches and were found to be generally ineffective. Although they completely cleaned the surface of the oiled sand, they removed little of the total oil. Instead they caused the oil to penetrate more deeply into the underlying sand, thereby compounding the pollution problem by expanding the zone of pollution, complicating any subsequent mechanical removal and, possibly, causing the oil to persist longer. Chemical treatment failed to induce 'quicksand' or cause perceptible erosion of beach sand. A decrease in the 'cohesiveness' of the sand was observed, but this also occurred in the presence of oil alone and could not be attributed to the presence of chemical.

BIOLOGICAL N2 FIXATION IN LAKES,
Wisconsin Univ., Madison. Water Resources Center.
Robert H. Burris.
Available from the Clearinghouse as PB-189 163, $3.00 in paper copy, $0.65 in microfiche. Wisconsin Water Resources Center, Technical Report OWRR B-020-Wis, 1969. 6 p. OWRR Project B-020-WIS.

Descriptors: *Nitrogen-fixation, *Nutrients, *Lakes, *Algae, *Nitrogen, Wisconsin.
Identifiers: *Analytical methods, *Biochemistry methods, Seasons, Acetylene reduction test.

Acetylene reduction by nitrogen-fixing organisms was used to estimate potential nitrogen fixation by blue-green algae in lakes. The method gives a useful index of nitrogen fixation with regard to the role of nitrogen-fixing agents in the eutrophication process. Lake Mendota (eutrophic), Madison, Crystal and Trout Lakes (oligotrophic), Vilas County, Wisconsin, and Little Arbor Vitae Lake (eutrophic) Vilas County, Wisconsin, were sampled at points 100 feet from shore and at mid-lake during the summer of 1968. Analyses of samples indicated that acetylene reduction varies drastically among lakes in a given area (Little Arbor Vitae Lake fixed 125-380 nanomoles C sub 2 H sub 4 N/30 minutes to less than one nanomoles for Trout Lake on July 28, 1968), and varies markedly with time in a specific lake (for Little Arbor Vitae Lake, when samples were collected on September 10, 1969, the acetylene reduction per liter of water or per mg N had decreased 10 to 20 fold from those of July 28, 1968). Acetylene reduction in lakes was studied with respect to changes in season, presence of natural-occurring algae (Gloeottichia colonies chiefly), variation in depths, and difference in light. Samples taken from Green Bay, Wisconsin were also analysed. (Kerrigan-Wisconsin)

THE MINERAL NUTRITION OF MICROCYSTIS AERUGINOSA,
Wisconsin Univ., Madison. Dept. of Botany.
Gerald C. Gerloff, George P. Fitzgerald, and Folke Skoog.
American Journal of Botany, Vol 39, p 26-32, 1952. 7 tab, 8 ref.

Descriptors: *Algae, *Nutrients, *Nutrient requirements, Growth rates, Laboratory tests, Cultures, Sodium compounds, Nitrogen.
Identifiers: *Microcystis aeruginosa (Kutz), Culture media, Chu No 10 solution, Minimum nutrients.

A Microcystis aeruginosa (Kutz) culture was made axenic by ultraviolet light and grown in basal medium of Chu No 10 solution, modified so that cations were furnished as chloride salts, and anion as the sodium salts. Minimum elemental requirements for optimum growth yield was determined by use of this medium. Small amounts of sodium were reported to be essential for the growth of Microcystis but a beneficial effect of either sodium carbonate or sodium silicate was found to be due primarily to pH control. Microcystis exhibited an optimum growth at pH of approximately 10; at this pH, sodium nitrate, sodium nitrite or ammonium chloride were equally effective nitrogen sources. When minimum nutrient concentrations were determined each in turn, a new medium composed of these concentrations was found to support maximum yields as compared to the slightly modified Chu No 10 medium. Composition of this medium, in milligrams/liter, was: nitrogen 13.6; phosphorus 0.18; sulfur 0.83; potassium 1.13; magnesium 0.13; calcium 0.25; iron 0.06; and the 'usual' amounts of sodium carbonate and sodium silicate. Disadvantages of this medium for routine use were that growth lag, pale cells, and requirements for a 'larger' inoculum was exhibited. (Gerhold-Wisconsin)

I. PRODUCTIVITY: PRIMARY PRODUCTIVITY STUDIES IN LAKE TAHOE, CALIFORNIA,
California Univ., Davis. Dept. of Zoology.
Charles R. Goldman, and Richard Armstrong.
Verh Internat Verein Limnol, Vol 17, p 49-71, Nov 1969. 21 fig, 3 tab, 9 ref.

Descriptors: *California, Nevada, Eutrophication, Oligotrophy, Littoral, Periphyton, Diatoms, Fungi, Streams, Carbon radioisotopes, Temperature, Light intensity, Calcium, Magnesium, Sodium, Potassium, Spectrophotometry, Nitrogen, Ammonia, Photosynthesis, Phosphates, Nitrates, Growth rates, Depth, Distance, Areal, Sampling, Surface waters, Runoff, Ultraviolet radiation.
Identifiers: *Lake Tahoe (Calif), Gomphonema constrictum, Apostemidium guernisael, Homewood (Calif), Fragilaria crotonensis, Organic growth factors, Chelation.

Lake Tahoe's enrichment and areal variability in productivity influenced by tributary streams have been investigated. Knowledge of factors causing higher production rates in certain areas should enhance evaluation of nutrients in entire lake and assist in effectively slowing eutrophication. Productivity measurements at the mouths of streams showed dispersion of stream-borne nutrients influencing primary productivity. Calculating relative photosynthetic efficiences provided best comparisons of areal variability. Relative influence of tributary waters of three streams was assessed; water from unpolluted control stream did not provoke the response as the others. Although importance of nitrogen or phosphorus was implied, stream water appeared more stimulating than its nitrogen and phosphorus content alone implied, perhaps affected by organic growth factors or natural chelating agents. Each stream bioassay was accompanied with a productivity experiment at the stream's mouth in the lake. Stimulation of photosynthesis by stream water was seasonal. Water was analyzed for calcium, magnesium, sodium, potassium and ultraviolet absorbance. Absorbance was greater in streams than lake and offered greater promise of being a water-mass indicator; its measurements in water samples, compared with productivity data, showed relationship restricted to waters around the Upper Truckee River mouth. EDGARDO BALDI MEMORIAL LECTURE: CURRENT CONCEPTS IN AQUATIC MICROBIOLOGY,
Woods Hole Oceanographic Institution, Mass.
Holger W. Jannasch.
Verh Internat Verein Limnol, Vol 17, p 25-39, Nov 1969. 5 fig, 61 ref.

Descriptors: *Aquatic microbiology, Limnology, Enzymes, Carbon radioisotopes, Bicarbonates, Bacteria, Biomass, Respiration, Degradation (Decomposition), Hypolimnion, Sulfides, Eutrophication, Nitrification, Photosynthetic bacteria, Pigments, Productivity, Physiological ecology, Metabolism, Bioassay, Benthic flora, Gas chromatography, Ecology, Biochemistry
Identifiers: Uptake rate, Substrate concentration, Adenosine triphosphate, Nucleic acids, Black Sea, Autotrophic, Heterotrophic, Light absorption, Carotenoids, Bdellovibrio, Morphology, Autoradiography, Thymidine, Chemostat, Autochthonous, Steady state, Zymogenous, Suspended particles, Halophilism, Psychrophilisms, Physiology.

Ecological niches, such as sulfide-containing hypolimnia, are highly selective habitats for some specific microbial metabolic types. This area requires microbiological studies based on clear ecological concepts. In analytical approach to natural microbial populations, use of a pure bacterium culture was suggested as a 'bioassay' procedure. Where gas chromatography, atomic absorption, or enzymatic techniques fail, the bioassay may be useful. One problem in aquatic microbiology is assessing growth or metabolic transformations at minute concentrations of energy sources or essential nutrients. Advantage of determination of incorporation of labelled thymidine into cells by autoradiography lies in its specificity compared to the relatively unspecific dark uptake of labelled bicarbonate. Not until discovery that a homogeneously mixed continuous culture of an exponentially growing microorganism represents a self-adjusting system (chemostat) did continuous culture technique become invaluable in quantitative studies. While classical enrichment techniques are limited to microbial species of substrate specificity, the selective properties of the chemostat have been used for enrichments and isolations of some inconspicuous metabolic types. An aspect of microbial ecology is two species establishing a steady state, one dependent on growth limiting factor, the other controlled by metabolic products of the first. (Jones-Wisconsin)

NITROGEN METABOLISM IN LAKES. II. ROLE OF NITROGEN FIXATION IN SANCTUARY LAKE, PENNSYLVANIA,
Pittsburgh Univ., Pa. Dept. of Biological Sciences.
Vera A. Dugdale, and Richard C. Dugdale.
Limnology and Oceanography, Vol 7, p 170-177, 1962. 3 fig, 4 tab, 14 ref.

Descriptors: *Nitrogen fixation, *Lakes, *Eutrophication, Nitrates, Ammonia, Phosphates, Sewage, Photosynthesis, Pennsylvania.
Identifiers: Nitrogen budget, Nitrogen-15, Anabaena, Sanctuary Lake (Pa).

Using nitrogen-15, high rates of nitrogen fixation were demonstrated in Sanctuary Lake, Pennsylvania. The fixation was related to light, and therefore probably to photosynthesis. Significant fixation rates were found first in early June and rates of at least 1% per day prevailed until September. There was a correlation between the appearance of Anabaena in the spring and nitrogen fixation rates and the implication is that these organisms are probably the important primary fixers. Rates of nitrogen fixation were highest when the ammonium and nitrate concentrations were minimal. Another factor of possible importance in determining the nitrogen fixation rates in this lake is the input of raw sewage from an adjacent town. (Keeney-Wisconsin)

THE SHAGAWA LAKE, MINNESOTA, EUTROPHICATION RESEARCH PROJECT,
Federal Water Pollution Control Administration, Corvallis, Oreg. Pacific Northwest Water Lab.
Robert M. Brice, and Charles F. Powers.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 258-269. 5 fig, 4 tab.

Descriptors: *Minnesota, *Eutrophication, Sewage effluents, Tertiary treatment, Algae, Water quality, Coniferous forests, Deciduous forests, Phosphorus, Nitrogen, Cyanophyta, Chlorophyta, Diatoms, Weight, Pilot plants, Iron, Chlorella, Sodium, Potassium, Silicates, Dissolved solids, Calcium, Productivity, Standing crop, Chlorophyll, Phosphates, Additives.
Identifiers: *Shagawa Lake (Minn), Ely (Minn), Blooms, Chlorella pyrenoidosa, Microcystis aeruginosa, Burntside River (Minn).

This project sought to determine whether Shagawa Lake would recover from its presently advanced state of eutrophication if secondary sewage effluent presently entering the lake were changed to nutrient-stripped tertiary. Although data are incomplete and conclusions preliminary, studies showed lake water containing 5% secondary sewage effluent had appreciably higher algal productivity than Shagawa Lake water only or water containing 5% tertiary sewage effluent, the latter addition making no appreciable difference in the lake water. Burntside River water (80% surface inflow) containing 2% secondary sewage effluent had appreciably higher algal productivity than corresponding mixtures containing tertiary effluent. Further testing of Shagawa Lake water and Burntside River is continuing, using other concentrations of additives to explore more completely the biostimulation achieved through sewage fertilization. Additionally, experiments will be carried out in which various concentrations of nitrogen and phosphorus are added to Burntside River water, to determine whether either or both elements act to limit algal production. Anticipated results of these experiments will provide information necessary to decisions on future management policies for Shagawa Lake. (See Vol. 3, No. 7, Field 5C, W70-02775). (Jones-Wisconsin)

THE EFFECTS OF OIL-SPILL REMOVERS ('-DETERGENTS') ON THE GASTROPOD NUCELLA LAPILLUS ON A ROCKY SHORE AND IN THE LABORATORY,
Marine Biological Association of the United Kingdom, Plymouth (England). Lab.
G. W. Bryan.
Journal of the Marine Biology Association, U.K., Vol 49, p 1067-1092, 1969. 8 fig, 4 tab, 11 ref.

Descriptors: *Detergents, *Oily water, *Water pollution effects, Water pollution treatment, *Animal populations, Mortality, Food abundance, Resistance, Toxicity, Bioassay, Growth rates, Persistence, Migration.
Identifiers: *Torrey Canyon, *Nucella lapillus, *Growth disturbances, *Shell growth, Recolonization, Intertidal animals, BP 1002.

The effects of oil-spill removers ('detergents') on a population of Nucella Lapillus was studied at Porthleven in South Cornwall, where heavy oil pollution occurred following the Torrey Canyon incident in March 1967. At Porthleven the species was wiped out in the harbour and the majority of animals were killed on the reef nearby. Growing animals which recovered from the effects of the 'detergent' were later found to have developed growth disturbances in the shell. These effects on growth appear to be an indirect effect of 'detergent' resulting from its interference with the ability of the animal to feed and with the availability of food. Recolonization of the reef depended largely on the survival of some very young animals in the sublittoral zone. Most of the potential predators had been wiped out by the 'detergent', these animals were able to invade the reef in large numbers late in 1967. In contrast, recolonization of the outer harbour, where the species was wiped out, was slow during the first 2 years and dependent on lateral movements of animals from the reef. (Sjolseth-Washington)

REPRODUCTION IN BROOK TROUT (SALVELINUS FONTINALIS) FED SUBLETHAL CONCENTRATIONS OF DDT,
New Hampshire Univ., Durham. Dept. of Zoology.
Kenneth J. Macek.
Journal Fisheries Research Board of Canada, Vol 25, No 9, p 1787-1796, 1968. 1 fig, 4 tab, 17 ref. OWRR Project B-001-NH.

Descriptors: *DDT, *Fish reproduction, *Viability, *Pesticide toxicity, Brook trout, Chlorinated hydrocarbon pesticides, Mode of action fish eggs, Mortality, Pesticide residues, Gas chromatography, Growth rates.
Identifiers: *Gametes, *Sublethal effects, Chronic exposure, Sac fry.

Groups of sexually maturing yearling brook trout were fed for 156 days with DDT at .05 mg/kg per week (control, and 0.5, 1.0 and 2 mg/kg per week. The DDT caused no mortality and fish fed at the lower dosages produced more mature ova than untreated fish. The size of the male fish at the end of the feeded period was observed to increase according to the dosage of DDT. Egg and sac fry mortality was higher when at least one of the gametes came from treated fish than when they both came from untreated fish. Most mortality of sac fry in groups where the eggs came from treated fish occurred during the 15th week of development. This was the period of maximum utilization of yolk fat, thus indicating that insecticide residues in the eggs were released at this time and resulted in mortality. (Sjolseth-Washington)

UPTAKE AND RETENTION OF MALATHION BY THE CARP,
Michigan Univ., Ann Arbor. Dept. of Environmental Health.
Michael E. Bender.
The Progressive Fish Culturist, p 155-159, July 1969. 5 tab, 3 fig, 8 ref. Pub Health Serv . Grant ES-00016-02.

Descriptors: *Carp, *Pesticide residues, *Retention, Organophosphorus pesticides, Pesticide removal, Gas chromatography, Degradation, Persistence, Hydrolysis, Metabolism, Hydrogen ion concentration, Food chains.
Identifiers: *Malathion, *Residue distribution, Oral uptake, Aqueous uptake.

It was found that carp exposed to 5 mg/l of malathion for 4 days contained highest residue levels in the liver, and that flesh, blood, gills, and brain have decreasing concentrations. The residue half-life of malathion in carp was calculated to be 12 hours. The significance of such a rapid rate of breakdown is discussed. The differences between aqueous and oral uptake were determined. Uptake by the intestinal tract does not contribute a significant amount to the malathion residue. (Sjolseth-Washington)
W70-03516

THE TOXICITY OF THE HYDROLYSIS AND BREAKDOWN PRODUCTS OF MALATHION TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS, RAFINESQUE),
Michigan Univ., Ann Arbor. Dept. of Environmental Health.
Michael Bender.
Water Research, Vol 3, p 571-582, 1969. 2 tab, 4 fig, 13 ref. US Public Health Serv Grant ES-00016-02.

Descriptors: *Hydrolysis, *Bioassay, *Degradation, Organophosphorus pesticides, Hydrogen ion concentration, Pesticide toxicity, Minnows, Mortality.
Identifiers: *Malathion, *Synergism, *Breakdown products, Pimephales promelas, DMPTA, Metabolites, Safe concentration.

Malathion undergoes hydrolysis in aqueous basic solutions to diethyl fumarate and DMPTA. The toxicity of the products of malathion hydrolysis in the fathead minnow, Pimephales promelas, were evaluated. The studies were conducted by toxicity bioassays of 96 hr duration and continuous exposure test of 14 day duration. The results of the experiments demonstrated the following: (1) the basic hydrolysis product, diethyl/fumurate, was more toxic than malathion to the test species; (2) a pronounced synergistic effect was demonstrated between malathion and its two basic hydrolysis products; and (3) continuous exposure decreased the TLm concentration of malathion and its basic hydrolysis products. (Sjolseth-Washington)

EFFECTS OF FIVE HERBICIDES ON THREE GREEN ALGAE,
North Texas State Univ., Denton. Dept. of Biology.
B. Dwain Vance, and David L. Smith.
Texas Journal of Science, Vol XX, p 329-337, Apr 1969. 1 tab, 41 ref.

Descriptors: *Herbicides, *Growth rates, *Algae, 2-4-D, Aminotriazole, 2-4-5-T, Scenedesmus, Chlamydomonas, Chlorella, Mortality, Bioassay, Inhibition, Mode of action, Photosynthesis.
Identifiers: Simazine 80 W, Dacthal.

Screening tests were made to determine if the herbicides Simazine 80W, Dacthal, Amitrol-T, 2,4-D, and 2,4,5-T were toxic to bacteria-free unialgal cultures of Scenedesmus quadricauda, Chlamydomonas eugametos, and Chlorella pyrenoidosa TX 7-11-05. Dacthal, Simazine, 2,4-D and 2,4,5-T showed no toxic effects on any of the algae at concentrations up to 200 ug/ml. Simazine increased the growth of C. eugametos in concentrations up to 200 ug/ml. Amitrol-T was inhibitory to all the algae at high concentrations but showed no effect at concentrations below 150 ug/ml. (Sjolseth-Washington)
W70-03519

BIOLOGICAL CONCENTRATION OF PESTICIDES BY ALGAE,
North Texas State Univ., Denton. Dept. of Biology.
B. Dwain Vance, and Waymon Drummond.
Journal American Water Works Association, Vol 61, No 7, p 360-362, July 1969. 2 tab, 11 ref. US Public Health Serv Research Grant CC 00269.

Descriptors: *Algae, *Pesticide toxicity, *Pesticide removal, *Food webs, DDT, Chlorinated hydrocarbon pesticides, Aldrin, Endrin, Dieldrin, Scenedesmus, Gas chromatography, Resistance, Bioassay, Growth rates, Pesticide residues, Deterioration.
Identifiers: *Biological concentration, Anabaena cylindrica, Microcystis aeruginosa, Oedognium.

Unialgal cultures of Microcystis aeruginosa, Anabaena cylindrica, Scenedesmus quadricauda, and Oedogonium sp. were grown in the presence of aldrin, dieldrin, endrin and DDT in concentrations of 5, 10 and 20 ug/ml. These algae are effective in accumulating pesticides from the medium in which they grow. In no case was concentration less than 100 fold. Algae were shown to accumulate detectable quantities within 30 minutes after exposure. The algae were shown to be highly resistant to the pesticide, except that dieldrin, aldrin, and endrin are algicidal to M. aeruginosa at concentration of less than 5 ug/ml. The authors feel that the ability of algae to concentrate pesticides without themselves succumbing may be a potential danger to organisms higher up the food chain. (Sjolseth-Washington)
W70-03520

SOME EFFECTS OF CARBON DIOXIDE ON THE BLOOD OF RAINBOW TROUT Salmo gairdneri RICHARDSON,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
F. B. Eddy, and R. I. G. Morgan.

Journal of Fisheries Biology, Vol 1, p 361-372, 1969. 6 tab, 3 fig, 37 ref.

Descriptors: *Carbon dioxide, *Fish physiology, *Acclimatization, Rainbow trout, Toxicity, Respiration, Oxygenation.
Identifiers: *Fish blood, *Blood analysis, *Bohr effect, *Root effect, Oxygen capacity, Hematocrit, Hemoglobin, Blood iron content, Erythrocyte.

Various hematological measurements, including pH determinations were made on blood from rainbow trout acclimated to 40 ppm free CO2 and 70 to 100 ppm free CO2 in order to investigate any differences occurring in the respiratory properties of the blood. When equilibrated with various CO2 tensions, blood from acclimated trout showed smaller Bohr and Root effects than blood from the non-acclimated trout. Blood from acclimated trout contained more hemoglobin which was not completely saturated with oxygen when equilibrated in air. Oxygen dissociation curves were constructed and evaluated. The authors concluded that rainbow trout can acclimate to some extent, to the stress of high CO2 levels. Thus trout inhabiting water liable to pollution from CO2 can accommodate this stress to some extent. (Sjolseth-Washington)
W70-03522

SOME FACTORS INFLUENCING SUSCEPTIBILITY OF RAINBOW TROUT TO THE ACUTE TOXICITY OF AN ETHYL MERCURY PHOSPHATE FORMULATION (TIMSAN),
Western Fish Disease Lab., Seattle, Wash.
Donald F. Amend, William T. Yasutake, and Reginald Morgan.
Transactions of the American Fisheries Society, Vol 98, No 3, p 419-425, 1969. 1 fig, 4 tab, 12 ref.

Descriptors: *Rainbow trout, *Bioassay, Water temperature, Dissolved oxygen, Calcium carbonate, Water pollution effects, Toxicity, Fish kill.
Identifiers: *Ethyl mercury phosphate, *Timsan, *Susceptibility, *Mercury, Water hardness, Chloride ions.

This study determined the influence of water temperature (55-68 deg), dissolved oxygen (4-12 ppm), water hardness as CaCO3 (20-256 ppm), and chloride ions (to 2mM) on the susceptibility of rainbow trout (Salmo gairdneri) to the acute toxicity of ethyl mercury phosphate (EMP). The fish were exposed for one hour to 0.125 ppm EMP, the active ingredient of Timsan, a commercial EMP formulation. The death rate because of the exposure to EMP increased with an increase in water temperature, a decrease in dissolved oxygen, and an increase in chloride ions; calcium appeared to have no effect. The effect of water temperature and dissolved oxygen was ascribed to changes in the respiration rate of the fish, and a chemical explanation is presented for the effect of chloride ions. (Sjolseth-Washington)
W70-03523

THE DIURETIC RESPONSE BY RAINBOW TROUT TO SUB-LETHAL CONCENTRATIONS OF AMMONIA,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
R. Lloyd, and Lydia D. Orr.
Water Research, Vol 3, p 335-344, 1969. 6 fig, 19 ref.

Descriptors: *Ammonia, *Urine, *Acclimatization, Rainbow trout, Permeability, Fish physiology, Toxicity, Water temperature, Laboratory equipment.
Identifiers: *Diuresis, *Urine excretion rates.

The rate of urine excretion by rainbow trout increases with a rise in the concentration of ambient un-ionized ammonia. It is suggested that this diuresis is caused by an increase in the permeability of the fish to water. Quantitative measurements of urine excretion rates indicate that concentrations of un-ionized ammonia below 12 per cent of the lethal threshold concentration may be without toxic effect. Increases in temperature produce no well defined trend in urine excretion rates with a given concentration of un-ionized ammonia, but normal excretion rates have a Q10 of 2.4. Some evidence is presented for acclimation of rainbow trout to sub-lethal levels of ammonia. It is suggested that any environmental factor which affects the water balance of fish may also influence their susceptibility to ammonia poisoning. (Sjolseth-Washington)
W70-03524

ACCUMULATION OF DIELDRIN BY FISH AND SELECTED FISH-FOOD ORGANISMS,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
George G. Chadwick, and Robert W. Brocksen.
The Journal of Wildlife Management, Vol 33, No 3, p 693-700, 1969. 8 fig, 14 ref.

Descriptors: *Pesticide removal, *Pesticide residues, Dieldrin, Sculpins, Tubificids, Retention, Chlorinated hydrocarbon pesticides, Gas chromatography, Persistence, Pesticide toxicity.
Identifiers: *HEOD, *Accumulation rates, *Method of uptake, Cottus perplexus, Chironomidae.

The rate of uptake of HEOD (a dieldrin component) from contaminated water (0.017 to 8.6 parts per billion (ppb)) or food by the reticulate sculpin (Cottus perplexus) and fish-food organisms, tubificid worms (Tubifex sp.) and midge larvae (Chironomidae) was determined. Accumulation of HEOD by the fish was dependent on its concentration in the water, and the accumulation was nearly constant at each exposure level during the 32-day test period. The saturation level of HEOD in the fish apparently was never reached. Feeding experiments using contaminated tubificid worms as the food source, showed that the retention of HEOD by fish was inversely related to the amount of HEOD they consumed. Fish retained nearly all of the HEOD they consumed when given small amounts in their food, but they retained a much lower proportion of the available HEOD when given large amounts in food. Authors concluded that fish can accumulate HEOD both from the surrounding water and from their food, but accumulation of HEOD from the water does not appear to be additive with the HEOD accumulated from the food. (Sjolseth-Washington)
W70-03525

THE EFFECTS OF TEMPERATURE ON THE SUSCEPTIBILITY OF BLUEGILLS AND RAINBOW TROUT TO SELECTED PESTICIDES,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
Kenneth J. Macek, Curt Hutchinson, and Oliver B. Cope.
Bulletin of Environmental Contamination and Toxicology, Vol 4, No 3, p 174-183, 1969. 3 tab, 7 ref.

Descriptors: *Bioassay, *Pesticide toxicity, Rainbow trout, Water temperature, Mode of action, Pesticide removal, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Aldrin, Dieldrin, Endrin, Heptachlor, Fish physiology.
Identifiers: *Susceptibility, *Median tolerance limits, Bluegills, Chlordane, Lindane, Malathion Methoxychlor, Endosulfan, Toxaphene, Pesticide uptake, Enzymatic activity.

The median tolerance limits to 15 pesticides were calculated for 24 and 96 hours of exposure at 1.6 deg, 7.2 deg and 12.7 deg C for rainbow trout and at 12.7 deg, 18.3 deg and 23.8 deg C for bluegills. The pesticides tested were aldrin, chlordane, naled, dieldrin, diuron, Dursban, endrin, azinphosmethyl, heptachlor, lindane, malathion, methoxychlor, endosulfan, toxaphen, and trifluralin. There was generally an increase in the susceptibility of fish to most pesticides tested as temperature increased. The authors feel this increased susceptibility to be due to an increased level of enzymatic activity and possibly to the effect of temperature on metabolism. The authors stressed the need for considering interactions between pesticides and environmental factors when determining safe levels in aquatic habitats. (Sjolseth-Washington)
W70-03526

RESPONSE OF THE INTERRENAL GLAND OF RAINBOW TROUT (SALMO GAIRDNERI) TO STRESS,
Michigan State Univ., East Lansing. Dept of Physiology.
Cliff W. Hill, and Paul O. Fromm
General and Comparative Endocrinology, Vol 11, No 1, p 69-77, 1968. 6 tab, 31 ref FWPCA Grant WP 00807.

Descriptors: *Stress, *Chromium, *Fish physiology, Rainbow trout, Fluorescence, Test procedures.
Identifiers: *Plasma cortisol, *Plasma glucose, *Interrenal gland, Liver glycogen, ACTH.

Exposure of trout to environmental hexavalent chromium (0.02 and 0.2 mg/liter of water) for 1 week caused a significant elevation of plasma 'cortisol' as determined by fluorescence in sulfuric acid. Fish exposed to these concentrations for 2 and 3 weeks had plasma levels similar to those of controls. Forced exercise twice daily for 1 and 2 weeks did not give rise to elevated plasma 'cortisol' if samples were obtained 24 hours after the last exercise period. Fish forced to swim and sampled immediately did have plasma 'cortisol' levels significantly above those of controls. Animals treated with exogenous cortisol had plasma 'cortisol' levels over 100 ug/100 ml. Fasted fish so treated for 1 week had higher liver glycogen stores and excreted more waste nitrogen than did control fish. Plasma glucose was not elevated in treated fish. Animals similarly treated but fed during the experimental period had liver glycogen stores and nitrogen excretion rates similar to those of controls. (Sjolseth-Washington)
W70-03527

THE EFFECT OF SOME MYCOTOXINS ON THE BRINE SHRIMP, ARTEMIA SALINA,
Food and Drug Administration, Washington, D.C. Div. of Microbiology.
R. F. Brown.
Journal of the American Oil Chemists' Society, Vol 46, No 2, p 119, 1968. 1 fig, 3 ref.

Descriptors: *Brine shrimp, *Bioassay, Mortality, Toxins.
Identifiers: *Aflatoxia B1, *Ochratoxin A, Artemia salina, Aflatoxins, Mycotoxins.

The chemical determination of nycotoxins in foods using bioassay techniques with the brine shrimp, Artemia salina, was discussed. Aflatoxin B1, at dose levels of 1.0 ug/ml and above, produced over 90% mortality after 24 hours. At 0.5 ug/ml there was a 61% mortality of Artemia. Ochratoxin A, at 1.0 ug/ml produced a 15% mortality; at 2.0 ug/ml, mortality was 23%; at 16.0 ug/ml, mortality was 49%. Further investigation is warranted on the possibility of using brine shrimp as a bioassay for other mycotoxins. (Sjolseth-Washington)

COMPARATIVE HYDROCHEMICAL CHARACTERISTIC OF RESERVOIRS - COOLERS OF STATE REGIONAL ELECTRIC POWER (HEAT) STATIONS OF THE UKRAINE (In Russian),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
S. I. Abremskaya.
English summary. Gidrobiolo gicheskii zhurnal, Vol 5, No 1, p 38-42, 1969. 1 tab, 8 ref, 2 fig.

Descriptors: *Cooling, *Reservoirs, Environmental effects, Thermal pollution, Dissolved oxygen, Chemical properties, Ponds, Photosynthesis.

Identifiers: Cooling ponds, Effects on chemical properties, Temperature effects.

Hydrochemical characteristics of cooling ponds of 5 Ukrainian electrical power stations were examined in this study. The waters of the Kurakhov and Zuyer cooling ponds were characterized by high mineralization and hardness; the total ions were somewhat lower in the Lupansk and Zmiyer cooling ponds, and the lowest values were found in the cooling pond of the Krivoi Rog electric power station. The discharge of heated waters did not substantially effect the ion-salt components of the ponds. The content of biogenic and organic substances and gas condition in the ponds depended chiefly on local conditions of effluents and internal processes. The ponds studied were eutrophic and mesotrophic according to their production levels. The effect of increased temperature was mostly visible in gas production and in the dynamics of organic and biogenic substances. According to winter data, the pH in heated parts of the ponds was somewhat higher than in cooler areas. It is probable that photosynthesis is more active in the heated parts in this period, which favors more intensive accumulation of organic matter. Also, BOD was much higher in heated than in cool portions. As a result of increased temperature, solubility of O2 in the cooling ponds decreased. The concentration of O2 in the heated parts of cooling ponds in winter was lower than in parts under natural conditions. Local decrease of O2 content in warm parts may be explained also by higher mineralization of organic matter and respiration of hydrobiants. The content of biogenic elements in warmer parts of the ponds was somewhat lower than in cooler portions, which may be explained by their greater consumption by phytoplankton. The quality of waters in cooling ponds can be improved by maximum water-exchange and the removal of excess salts. (Novotny-Vanderbilt)

THE RETURN OF THE BLUEBACK SALMON TO THE COLUMBIA RIVER,
Frederic F. Fish.
Scientific Monthly, Vol 66, p 283-292, 1948. 2 tab.

Descriptors: *Columbia River, *Grand Coulee Dam, *Relocation, Spawning Brood Stock.
Identifiers: *Parent Stream Theory, Blueback salmon.

The year 1941 was a critical one for the blueback salmon of the Columbia River, for one brood of the species came very close to extinction. Only 949 fish were counted passing Rock Island Dam to the spawning grounds. The most acceptable explanation for the small number of fish reaching the spawning grounds lies in the abnormally warm water temperatures that prevailed that year. The high temperatures are believed to have caused the blueback to turn into downstream tributaries seeking relief from the warm water, and to have established a favorable environment for Chrondrococcus columnaris. As a result of the construction of Grand Coulee Dam, which blocked the entrance to the upper Columbia blueback spawning grounds, the Fish and Wildlife Service began a relocation project which was predicated upon the assumption that the young of the relocated fish would return to the streams in which they were reared, and not to their ancestral spawning areas. The fish were trapped in the fish ladders at Rock Island Dam and trucked to hatcheries where young were artificially propagated. The relocation project was begun in 1940, but it was not until 1943 that an effective disinfectant was found which eliminated all infectious diseases without danger to the blueback fingerlings. By that time a diet had been compounded which met all nutritional requirements of the fish. The loss of eggs and fingerlings was reduced from 83.4% in 1940 to 16.3% in 1943. The 1947 run demonstrated the success of the 1943 hatch, when 204,489 fish were estimated in the Columbia River. The estimated run in 1945, progeny of the fish trapped in the 1941 run was only 9,269. The relocation project appeared to have been successful and the blueback salmon had returned to the Columbia River. (Speakman-Vanderbilt)

EFFECT OF ORGANIC WASTE AND COOLING WATER ON SELF-PURIFICATION OF WATERS,
Technische Hochschule, Aachen (West Germany).
B. Boehnke.
Purdue University, Eng Bull, PT 2 Ext Ser No 129, p 752-770, 1967.

Descriptors: Water pollution effects, *Cooling water, *Thermal pollution, *Self-purification, *Organic loading, Wastes, Waste assimilative capacity, Rivers, Watersheds (Basins), Biochemical oxygen demand, Oxygen sag, Dissolved oxygen.

Results achieved within the area of the Lippe Association illustrate what effect biological degradable industrial wastes may have on the self-purification capacity of flowing waters and what measures were, and still are, necessary for observing and improving conditions within a river basin. The effects of biological degradable industrial waste water and the discharge of cooling water on the self-purification capacity of the Lippe River can be estimated with satisfactory accuracy for long stretches of the river. The method of calculating the effect of organic loads on the process of self-purification as employed by the Lippe Association has proved to be a valuable help in establishing economical improvement schemes, in specific treatment measures, and in fixing contributions. It is an essential condition that O2 replenishment via the water surface and degradation rates within the river be known. Although the complex conditions prevailing in a water course rule out an exact precalculation of O2 conditions, as a characteristic feature of the process of self-purification under changing load conditions, it is possible to make a reliable estimate of biological processes. This will materially assist an engineer in his designs and studies and will help him in making necessary decisions. (Novotny-Vanderbilt)

THE EFFECTS OF IMPOUNDING RESERVOIRS ON RIVER WASTE ASSIMILATIVE CAPACITY,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
Peter A. Krenkel, William A. Cawley, and Virgil A. Minch.
Journal Water Pollution Control Federation, Vol 37, No 9, p 1203-1217, Sept 1965. 16 fig, 14 ref.

Descriptors: *Impoundments, *Waste assimilative capacity, Dissolved oxygen, Stratified flow, Backwater, Peak Power, Cooling water, Unsteady flow, Temperature, Thermal pollution.
Identifiers: *Weiss Reservoir, *Coosa River.

The major undesirable conditions which affect the observed reduction in waste assimilation capacity of previously unregulated rivers by the construction of impounding reservoirs are described. These major factors are the inherent low dissolved oxygen values in stratified reservoirs, the backwater conditions created by the downstream reservoir, the peaking power operations, and the stratified flow conditions induced by the discharge of cooling water into deep, slow-moving backwaters. The data presented show that the conditions created by the closure of Weiss Reservoir have reduced the waste assimilative capacity of the Coosa River by 80 percent of that obtained in the pre-impoundment free-flowing stream. The causes are the presence of the backwater curve caused by the Weiss Reservoir, unsteady flow conditions created by the cyclic power releases from the upstream Allatoona Reservoir, the stratified flow conditions created by the discharge of a heated power plant effluent, and the inherent changes in normal water quality caused by the presence of both reservoirs. (Rietveld-Vanderbilt)

EFFECT OF WATER TEMPERATURE ON DISCHARGE AND BED CONFIGURATION, MISSISSIPPI RIVER AT RED RIVER LANDING, LOUISIANA,
Corps of Engineers, Washington, D.C. Committee on Channel Stabilization.
P. P. Burke.
Committee on Channel Stabilization, Corps of Engineers, Technical Report No. 3, Aug 1966. 45 p, 6 fig, 6 tab, 18 ref.

Descriptors: *Water Temperature, Viscosity, Shape, River bed, Sand waves, Mississippi River.
Identifiers: Alluvial river, Gage hydrograph, Flood damage potential, Bed form, Configuration changes, Discharge.

The configuration of the bed of an alluvial river varies in accordance with the temperature of the water. Crossings and bends are lowered and systematic sand waves are redcuced in amplitude in a direct relation to decreasing water temperatures. The mechanism by which this occurs may be physical or chemical, or a combination of the two. Routine surveys made for other purposes afford a quantity of basic data to delineate changes in bed configuration. An examination of the basic data from field observations and from official Mississippi River Commission publications indicates water temperature has a real effect on bed form configuration. There is a need for continued investigation in this field through model study and field observations of the prototype. The presentation of these data is only a beginning and no attempt is made to explain the complicated mechanisms by which temperature accomplishes its apparent effect on sediment movement and deposition. AN EFFECT OF WATER HARDNESS IN THE THERMAL RESISTANCE OF THE RAINBOW TROUT, SALMO GAIRDNERII Richardson,
Toronto Univ. (Ontario). Dept. of Zoology.
David E. Craigie.
Canadian Journal of Zoology No 41, p 825-830, 1963. 2 fig, 2 tab, 5 ref.

Descriptors: *Water temperature, *Hardness, *Fish behavior, *Rainbow trout, Thermal stress, Saline water, Salinity, Trout, Fish, Environmental effects.
Identifiers: *Thermal resistance, Salmo gairdnerii, Hardwater, Softwater.

Resistance to thermal stress was studied in 2 groups of yearling trout (Salmo gairdnerii) in soft and saline waters at 27, 28, and 29 deg C. In all cases the group reared in soft water showed greater resistance to thermal stress than the group reared in hard water but otherwise under similar conditions. This difference in thermal resistance was associated not with experience in the development period (between fertilization and final adsorption of the yolk sac) but with experience in the subsequent growth period. It was also confirmed that increased salinity in the testing medium increased the thermal resistance; with fish reared in hard water, this effect was insignificant at a relatively low lethal temperature (27 deg C) but increased at higher temperatures, while with fish reared in soft water the advantage of increased salinity was significant at all 3 temperatures but greater at 28 deg C than at either 27 or 29 deg C. (Rietveld-Vanderbilt)

TEMPERATURES SELECTED BY TILAPIA MOSSAMBICA (PETERS) IN A TEST TANK WITH A HORIZONTAL TEMPERATURE GRADIENT,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Zoology.
T. R. Badenhuizen.
Hydrobiologia, No 30, p 541-554, 1967. 6 fig, 1 tab, 11 ref.

Descriptors: *Water temperature, *Fish behavior, *Fish, Thermal pollution, Temperature, Environmental effects.

Identifiers: *Temperature gradient, Tilapia mossambica, Temperature preference.

Investigations were made of the effects of temperature on juvenile Tilapia mossambica in long 21-compartment horizontal tanks with further compartments at either end containing an immersion heater and an ice block respectively, the fish being able to pass along the tank by swimming under the partitions, which were raised from the bottom With no temperature gradient along the tank the distribution was not random, owing to congregation of the fish towards the ends of the tanks, but when a temperature gradient was applied, the fish preferred to congregate in compartments in which the temperatures ranged from about 27 deg C to 33.5 deg C. Selected temperatures were higher than those occurring in the natural habitat of the fish. These results confirm that death of Tilapia in highveld dams in winter is due to low temperatures. (Rietveld-Vanderbilt)

EFFECTS OF TEMPERATURE UPON THE FORMATION OF VERTEBRAE AND FIN RAYS IN YOUNG CHINOOK SALMON,
Washington Univ., Seattle. Lab. of Radiation Ecology.
Allyn Seymour.
Transactions of the American Fisheries Society, Vol 88, No 1, p 58-69, 1959. 7 fig, 4 tab, 31 ref.

Descriptors: *Temperature, *Chinook salmon, *Eggs, Fish, Fish physiology.
Identifiers: *Vertebrae, *Fin rays, Fingerlings, Fish development.

Experiments in each of three successive years were designed to observe the effect of temperature upon chinook salmon, Oncorhynchus tshawytsch, during the period from the egg to the fingerling stage. Experimental temperatures ranged from 34 deg F to 74 deg F but there were no survivals to the stage where vertebrae or fin rays could be counted for lots reared at temperatures below 39 deg F or above 62 deg F. Two experiments were conducted at constant temperatures, while, in the third, the temperatures were lowered to 34 deg F from their initial levels at the rate of 1 deg F per 5 days. The temperatures were then held at 34 deg F for twenty days, after which they were raised 1 deg F per 5 days. For these experiments the average numbers of vertebrae per lot was less for lots reared at temperatures in the middle portion of the 39 deg F to 62 deg F range than for lots reared at either extreme of the range. The same effect was observed in regard to the number of individuals with abnormal vertebrae, but the opposite effect was observed in regard to the numbers of rays in the anal and dorsal fins. The difference in the average number of vertebrae of lots reared at various temperatures was less than the difference in the average number of vertebrae between the four stocks. The average numbers of vertebrae in the lots from the Sacramento River (California) and the three Washington rivers - Skagit, Green and Entiat - and reared at the same temperature (56 deg F) were respectively 66.39 plus or minus .047, 68.36 plus or minus .052, 69.57 plus or minus .23, and 71.73 plus or minus .031. For all lots the range in number of vertebrae was 63 to 78. (Speakman-Vanderbilt)

EFFECT OF HEAT ON THE LIGHT BEHAVIOUR OF FISH,
Toronto Univ. (Ontario).
C. W. Andrews.
Transactions, Royal Society of Canada, Section V, p 27-31, 1946. 2 fig, 1 ref.

Descriptors: Temperature, Light, Behavior, Acclimatization, Suckers, Fish behavior, Thermal pollution, Fish attractants, Fish repellants, Light intensity.

The effect of heat on the light behavior of the common sucker (catostomus commersonnii) has been studied. Two-year-old suckers were found to be negatively phototactic at depths of 8 and 12 inches, while they were positively phototactic at 16 inches or more depth. All sizes tested were found to become insensitive to light at temperatures less than lethal and they regained light sensitivity if the temperatures were lowered again. The temperature of insensitivity to light decreased with increased age. The temperature of insensitivity to light varied directly with temperature of acclimation, increasing from 20.3 deg C to 32.5 deg C for acclimation temperatures of 5 deg C to 22 deg C respectively, for light of constant intensity. The temperature of insensitivity also varied directly with light intensity, increasing from 10.5 deg C to 20.5 deg C for relative light intensities of 1 and 1000 respectively. (Speakman-Vanderbilt)

WATER TEMPERATURE AND SPRING FISHING, NORRIS RESERVOIR, TENNESSEE,
Tennessee Valley Authority, Norris.
Jack S. Dendy.
Journal, Tenn. Academy of Science, Vol. 21, p 89-93, 1946. 2 fig, 1 tab, 4 ref.

Descriptors: *Temperature, *Fishing, Spring, Stratification, Thermal stratification, Fish behavior, Creel census, Fish, Fish management, Tennessee.
Identifiers: *Norris Reservoir, Clinch River.

During the early spring of 1945, water temperatures were taken at regular intervals at three stations on Norris Reservoir. One station was in the deepest portion of the Reservoir, another in a moderately shallow area about 25 miles above the dam, and the third about midway between the other two. As expected, the water temperature increased more rapidly in the upper portion of the Reservoir than in the deeper parts near the dam. The surface water was consistently much warmer at the upstream station than at the deepwater station until early April. Inquiries of anglers and dock operators showed that anglers were taking fish in the upstream area as early as March 1, while at the deep water station the fish had not begun to bite. By early April, however, fishing in the downstream area was almost as good as in the upper region. (Speakman-Vanderbilt)

INCREASED SENSITIVITY TO PESTICIDES IN SHEEPSHEAD MINNOWS,
Bureau of Commercial Fisheries, Gulf Breeze, Fla. Biological Lab.
H. T. Holland, David L. Coopage, and Philip A. Butler.
Transactions of American Fisheries Society, Vol 95, No 1, p 110-112, 1966. 2 fig, 3 ref.

Descriptors: *DDT, *Endrin, *Bioassay, Resistance, Chlorinated hydrocarbon pesticide, Mortality, Fishkill, Pesticide toxicity, Water pollution effects.
Identifiers: *Sensitivity, *Sheepshead minnows.

Sheepshead minnows were exposed to 20 to 40 ppb DDT in aquaria for 24 hours. Survivors of DDT tests in which mortality exceeded 90% (R1 fish) and survivors of DDT with mortality from 55 to 90% (R2 fish) were transferred to artificial pools similar to the natural environment. The young of these fish and control fish were exposed to DDT (10, 13, and 15 ppb) and endrin (2 ppb). R1 young under went higher mortalities than the controls in all tests. Mortality of R2 young was greater than controls at 13 ppb DDT and in endrin. The authors feel these data indicate that a population of sheepshead minnow could tolerate an occasional heavy mortality. The increased sensitivity of the F1 generation indicate that serious mortality may result following low levels of pesticide contamination. (Sjolseth-Washington)

AVOIDANCE OF PESTICIDES BY UNTRAINED SHEEPSHEAD MINNOWS,
Bureau of Commercial Fisheries, Gulf Breeze, Fla.
David J. Hansen
Transactions of American Fisheries Society, Vol 98, No 3, p 426-429, 1969. 3 tab, 1 fig, 5 ref

Descriptors: *DDT, *Endrin, *2-4-D, *Fish behavior, Pesticide toxicity, Bioassay, Research equipment, Fish repellents, Organophosphorous pesticides.
Identifiers: *Avoidance, *Malathion, *Dursban, *Sevin, Sheepshead minnows, Ecological implications, Median tolerance limits, Pesticide concentrations.

The capacity of sheepshead minnows, Cyprinodon varigatus to avoid various concentrations of six pesticides (DDT, endrin, malathion, Dursban (R), Sevin (R), and 2-4D) was investigated. Test fish avoided water containing DDD (down to .005 ppm), endrin (.0001 ppm), Dursban (.1 ppm), and 2-4D (.1 ppm). The fish did not avoid the test concentrations of malathion or Sevin. When fish were exposed simultaneously to two different concentrations of the four pesticides that were avoided, they avoided the highest concentration of 2,4D but preferred the higher concentration of DDT. Fish did not discriminate between other concentrations of 2,4D or between different concentrations of endrin or Dursban. (Sjolseth-Washington)

SURVIVAL OF FISH IN 164 HERBICIDES, INSECTICIDES, FUNGICIDES, WETTING AGENTS AND MISCELLANEOUS SUBSTANCES,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
J. S. Alabaster.
International Pest Control, Vol II, No 2, p 29-35, Apr 1969. 1 fig, 7 ref, 7 tab.

Descriptors: *Bioassay, *Chlorinated hydrocarbon pesticides, *Organophosphorus pesticides, *Herbicides, *Fungicides, Pesticide toxicity, Pesticide residues, DDT, Rainbow trout, Brown trout, Hydro ion concentration, Analytical techniques, Hardness (Water).
Identifiers: *Rasbora heteromorpha (Harlequin), *Wetting agents, Plaice, Sheepdip.

Tests by the Salmon and Freshwater Fisheries Laboratory in London were conducted to measure the toxicity of 164 pesticides to fish. Harlequin fish (Rasbora heteromorpha), rainbow trout, brown trout and plaice were the test fish. The 24 and 48-hour median lethal concentrations, together with the estimated mean threshold values (concentration at which 50% of the fish would be killed in 3 months) are given for herbicides, fungicides, insecticides, excluding DDT and sheep dips, wetting agents and miscellaneous substances. In general the relationship between the logarithm of survival time and the logarithm of material concentration is non-linear, often indicating a threshold concentration for survival. The results suggest it is essential to test actual pesticide as sold rather than rely on figures available for the toxicity of the ingredients. In only very few cases was the toxicity of a formulated compound dependent simply on the amount of active ingredient. (Sjolseth-Washington)
W70-03623

THE EFFECTS OF A ROTENONE TREATMENT ON THE INSECT FAUNA OF A CALIFORNIA STREAM,
California Univ., Davis. Dept. of Zoology; and California State Dept. of Fish and Game, San Francisco.
S. F. Cook, Jr., and R. L. Moore.
Transactions of American Fisheries Society, Vol 98, No 3, p 539-544, 1969. 3 ref, 6 fig.

Descriptors: *Rotenone, *Aquatic insects, Water pollution effects, Diptera, Caddisflies, Mayflies,

Persistence, Larvae, Treatment, Fish control agents.
Identifiers: *Recovery, *Insect fauna, Russian River, California, Ephemeroptera, Trichopters, Simuliids.

The population levels of the major insect groups subsequent to rotenone treatment in the treated and untreated zones in Robinson Creek were examined in both pools and riffles. A great resurgence of insect fauna after their initial near annihilation in the treated zone was noticed. The simuliids were the first major group to make a comeback in the treated riffles. Within two weeks they had taken over all available attachment space in the riffles. The authors feel that elimination of potential predators may account for this resurgence. It appears as if rotenone treatment had little lasting effect upon the non-target insect fauna of significance as fish forage. The authors caution relating these data to other instances of stream poisoning, since only a portion of Robinson Creek was treated. Season of treatment, sampling biases, and possible undetected species shifts are other points to be considered in evaluation of such projects. (Sjolseth-Washington)

OPPORTUNITIES FOR WATER SALVAGE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Lloyd E. Myers.
Civil Engineering - ASCE, Vol 40, No 1, p 41-44, Jan 1970. 4 p, 2 photo, 1 tab.

Descriptors: *Water reuse, *Reclaimed water, Tertiary treatment, Water supply, Irrigation water, Water management (Applied), Water resources development, Evaporation, Water harvesting, Evaporation control, Water conservation.
Identifiers: Water salvage techniques.

While the focus of attention for increasing water supplies has been on developing new supplies, there has been a relative neglect of the equally important sources of supply in water salvage. Some of these sources, such as wastewater reclamation and reuse of water by industry, are economically feasible today. Others such as reducing some irrigation use, are feasible today but their development will be delayed by social and economic factors which are difficult to predict. Such sources as vegetation management and water harvesting, can be expected to become economically feasible and socially acceptable within the next decade. These water salvage methods will ultimately make a major contribution to the solution of water supply problems. (Knapp-USGS)

ISRAEL TURNS TO SEWAGE FOR WATER.

Engineering News Record, Vol 183, No 19, p 42-43, Nov 6, 1969. 2 p, 1 fig, 3 photo.

Descriptors: *Water reuse, *Tertiary treatment, *Artificial recharge, Water spreading, Aerobic treatment, Anaerobic treatment, Arid lands, Desalination, Reclaimed water, Groundwater movement, Aquifers, Pumping.
Identifiers: *Israel.

With 90% of its water potential now being used and faced with the prospect of a 20% to 30% increase in demand for the next decade, Israel is turning to raw sewage as a source of supply. Under construction is a waste water reclamation project expected to hike the nation's supply by 12%. The effluent, to be reclaimed by treatment in sophisticated lagoons, will not be put into use directly but will be infiltrated into the ground and later recovered by wells. The spreading basins will be located in sand dunes that connect directly with the underlying sand-and-sandstone aquifer that is one of Israel's principal stores of groundwater. The treatment phases of the various lagoons include anaerobic lagoons, facultative lagoons, aerobic lagoons and a polishing lagoon. The spreading lagoons will be operated in rotation to allow for drying periods between successive fillings to prevent clogging. The infiltrated water will take one year or more to reach the periphery of the recharge area, where an encompassing string of borehole wells will recapture the water as a potable supply. Salinity will be about 300 ppm. Most of the reclaimed water will be used for irrigation. (Knapp-USGS)
W70-03270

EFFECT OF SURFACE/VOLUME RELATIONSHIP, CO-sub-2 ADDITION, AERATION, AND MIXING ON NITRATE UTILIZATION BY SCENEDESMUS CULTURES IN SUBSURFACE AGRICULTURAL WASTE WATERS,
California State Dept. of Water Resources, Fresno; and Federal Water Pollution Control Administration, Fresno, Calif.
Randall Brown, and James Arthur.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 80-97. 12 fig, 1 tab, 1 ref.

Descriptors: *Surface, *Volume, *Carbon dioxide, *Aeration, *Nitrates, *Cultures, *Scenedesmus, *Subsurface waters, *Agriculture, *Wastes, Algae, Assay, Dissolved solids, Chemical analysis, Phosphates, Iron compounds, Hydrogen ion concentration, Alkalinity, California, Light intensity, Temperature, Ions, Spectrophotometry, Suspended load, Fluorescence, Sumps.
Identifiers: Stripping, Firebaugh Center (Calif), Scenedesmus quadricauda, Cell counts, Species determination, Absorbance, Coenobia, Swirling, Volatile solids.

A method of removing nitrate-nitrogen from subsurface agricultural drainage water--algae stripping--encourages algal growth, nitrate is converted to cellular materials, and algae separated from liquid phase by centrifugation, flocculation, etc. This water, high in dissolved salts, is not a complete media for Scenedesmus (the alga used) growth. Laboratory studies are conducted to determine nutrient additions necessary for optimum growth (and nitrogen removal). One experiment determined effect of flask size, surface/volume ratio, and type of mixing (including aeration and carbon dioxide addition). Surface/volume ratio showed maximum growth or nitrogen removal occurred in 250-milliliter flasks containing 125 milliliters of culture. Compressed air alone effected a similar growth rate as compressed air enriched with carbon dioxide, neither additive affecting ultimate yield. In the agricultural drainage water used, carbon was probably a limiting element and rate of exchange across the surface of the culture was not sufficiently rapid with swirling only. The 7.3 - 7.6 pH range difference affected nutrient availability. In determining optimum amount of iron and phosphorus for nitrogen removal, type of mixing was significant. Measurement of the nitrate parameter by the specific ion electrode method can produce a rapid and reliable estimate of algal activity. (See Vol. 3, no. 7, Field 5C, entry W70-02775). A COMPREHENSIVE APPROACH TO THE MANAGEMENT OF PHOSPHATES,
Chicago Univ., Ill. Center for Urban Studies; and Bauer Engineering, Inc., Chicago, Ill.
John R. Sheaffer, Fred Roland, and Wayne Cowlishaw.

To be available also in US Congress, House Committee on Government Operations, Sub-Comm on Conservation and Natural Resources, hearings on phosphate based detergents, Dec 16-17, 1969, Wash, DC, 1970. A statement before the Conservation and Natural Resources Subcommittee of the House Committee on Government Operations on matters relating to the hearings on Phosphate-based Detergents, Dec 16-17, 1969. 15p.

Descriptors: *Water quality, *Phosphates, *Waste water treatment, Biochemical oxygen demand, Nitrates, Water pollution sources, Fertilizers, Waste storage, Aerobic treatment, Settling basins, Soil disposal fields.
Identifiers: Muskegon County (Mich).

The management of phosphates and water quality needs to utilize a comprehensive approach to waste water management. Past efforts at waste water management have been characterized by disjointed incrementalism, i.e., many different governmental bodies become involved in water quality control, decentralizing and weakening the total program. A new approach to waste water management is based on three underlying concepts. They are: first, pollutants are resources out of place; two, waste water management systems must be designed as closed systems; and third, the environment is a total entity. A waste water management plan is outlined based on a plan developed for Muskegon County, Michigan. This plan proposes the use of waste water for irrigation purposes on nutrient deficient soils. Waste water is transported from an urban area to a location with suitable environmental geologic condition where a lagoon system provides for aeration to satisfy biological oxygen demand, settling to remove settleable solids, aerobic bacteria to consume soluble organic wastes, and photosynthetic cells to convert nitrates and phosphates into algal cell material that can be retained by the soil. After treatment in the lagoon system, the waste water is applied to geologically suited land areas, turning previously unproductive land into valuable cropland. (David-Chicago)

FOAM SEPARATION OF KRAFT PULPING WASTES.
Georgia Kraft Co., Rome. Research and Development Center.

FWPCA Grant No WPRD 117-01-68. Available from the Clearinghouse as PB-189 160, $3.00 in paper copy, $0.65 in microfiche. FWPCA Water Pollution Control Research Series, DAST-3, Oct 1969. 81 p, 2 tab, 14 fig, 28 ref, 5 append. FWPCA Program No 12040 EUG.

Descriptors: *Foam separation, *Pulping wastes, *B.O.D. removal, Tall oil removal, *Foaming reduction, *Solids removal, Treatment costs.

Laboratory studies of foam separation were conducted to determine the feasibility of this process for reducing B.O.D., solids content, and foaming tendency of clarified kraft mill effluent. Since kraft pulping wastes have a natural tendency to foam, it was expected that the foaming process, which has been found to be useful in treating domestic wastes, might have applications in treatment of these effluents. Both continuous flow and batch experiments were conducted, and liquid and foam heights, liquid feed rates, air sparging rates, and temperature were varied over wide ranges. The B.O.D. reduction in the treated liquid was disappointingly small, averaging less than 5 per cent, and the B.O.D. enrichment in the foam phase was in most cases less than 1.5 times that of the feed. Solids removal was correspondingly low. Foaming tendency, however, was significantly reduced by the intentional foaming process with reductions of 40 to 60 per cent in this variable being obtained. The reduction in foaming tendency was a strong function of gas-to-liquid ratio with the most effective operating range being between 1.0 and 1.5 SCFM/gallon. The experimental results suggest that the reductions in B.O.D. and foaming tendency were related to the separation of the tall oil

components of the waste. These components were concentrated in the foam fraction, but they accounted for a maximum of only 10 to 12 per cent of the B.O.D. of the raw feed. Apparently the remaining B.O.D.-producing materials were not surface active and did not attach themselves to the surface-active components. The cost of using a foam process on kraft mill wastes is estimated to be four to five cents per 1000 gallons of feed; this cost is exclusive of further processing of the concentrated foamate. Based on control of foaming tendency alone, the process would be unattractive from a cost standpoint.

FILTRATION OF ACTIVATED SLUDGE SECONDARY EFFLUENTS THROUGH SAND AND ANTHRACITE-SAND BEDS,
Wisconsin Univ., Madison. Water Resources Center.
Y. Misaka, and L. B. Polkowski.
Available from the Clearinghouse as PB-189 162, $3.00 in paper copy, $0.65 in microfiche. Wisconsin Water Resources Center, Technical Report OWRR A-006-Wis, June 1969. 198 p, 60 ref, 8 append. OWRR Project A-006-WIS.

Descriptors: *Flocculation, *Filtration, *Activated sludge, *Anthracite, Organic matter, Reclaimed water, Regressional analysis, Water pollution treatment, Protozoa.
Identifiers: *Sewage treated effluent, *Advanced waste treatment, *Sand, Filter backwashing, Experimental design.

Laboratory filtration studies were conducted on treated sewage effluent from a pilot activated sludge plant operated to provide effluent and mixed liquid solids for use in the experiments. The filtration media used were sand and a combination of anthracite and sand layers. To evaluate the filtration performance, statistical methods of experimental design and data analysis were applied. The major parameters varied for the experimental runs were flow rate, suspended particle size, suspended solid concentration, size of sand, size of anthracite, and depth of anthracite. Evaluation of filter performance was based on the amount of water produced per filtration run with an acceptable quality of filter effluent. Filtration performance ranged from 78 to 2430 gal/sq. ft. surface area for sand beds and from 488 to 4218 gal/sq. ft. for anthracite-sand beds. The concentration of the suspended solids in the influent applied was the most influential factor affecting performance and size of the top layer was the second most important factor as determined by regression analysis. Particle size of suspended solid applied was the third most important variable in terms of effect on performance when media size increased. The strength of the floc used was classified as 'strong' according to Hudson's breakthrough index. (Kerrigan-Wisconsin)

CURRENT PRACTICE IN POTATO PROCESSING WASTE TREATMENT,
Washington Univ., Seattle. Dept. of Civil Engineering.
Kristian Guttormsen, and Dale A. Carlson.
Available from the Clearinghouse as PB-189 232, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report DAST-14, Oct 1969. 108 p, 14 fig, 15 tab, 103 ref, 3 append. FWPCA Grant No. WP-01486-01, Program 12060.

Descriptors: *Waste treatment, *Potatoes, *Water pollution control, *Industrial wastes, Sewage treatment, Water reuse, Reclaimed water, Tertiary treatment, Lagoons, Spray irrigation, Filtration, Oxidation lagoons, Bibliographies, Costs, Byproducts
Identifiers: Potato waste treatment.

Potato processing, waste treatment, and current and needed research in water quality control in this production field are discussed. A brief discription is given of general characteristics of the potato and the effects and importance of cultural and environmental conditions on potato processing. General descriptions of the production processes are included and the literature is extensively reviewed to present current and proposed waste treatment technology. The most urgent research needs are discussed together with suggested methods for meeting these needs. (Knapp-USGS)

BIODEGRADABLE DETERGENTS: RECENT PROBLEMS AND PROGRESS.

Textile Manufacturer, Vol 91, p 472-473, Nov 1965.

Descriptors: *Detergents, *Biodegradation, *Surfactants, *Foaming, *Biochemical oxygen demand, Soaps, Treatment facilities.
Identifiers: Alkyli benzene sulfonates, Textile wastes.

Principal synthetic detergents or 'surfactants' are the sodium salts of alkyl benzine sulphonates. When made from branched hydrocarbon chains of 12-15 carbon atoms, the detergent is 'hard' and is only 50% biodegradable in sewage. Foam accumulation in sewage facilities results, and in river water one month is required for 75% detergent decomposition. Detergents with straight hydrocarbon chains, 'soft' detergents, are biodegradable 'to a much greater extent' than the 'hard', but cause a rise in sewage biological oxygen demand. 'Soft' detergents can be made using the Ziegler technique of catalytic polymerization of ethylene. (Sheffield-North Carolina State)
W70-03530

AN INDUSTRIAL WASTE GUIDE TO THE WOOL PROCESSING INDUSTRY.

American Dyestuff Report, Vol 44, p 655-661, 1955. 58 ref.

Descriptors: *Domestic wastes, *Biochemical oxygen demand, *Biological treatment, Water pollution effects, Waste treatment, Toxicity, Alkalinity, Detergents, Coagulation, Chemical precipitation, Biodegradation.
Identifiers: *Wool, *Dyeing wastes, *Scouring waste, Textile wastes, Fiber wastes, Recovery (Waste), Acid dyes, Wool grease.

Waste composition from an individual woolen mill is determined by the processing steps performed in the plant. Wool-scouring wastes are the strongest pollutants. Significant polluting characteristics of woolen wastes include a rise in oxygen demand, suspended solids, acidity, alkalinity, color and grease. Undesirable odor also occurs. When discharged into a stream, these deplete oxygen, change the stream's physical properties, and are toxic to stream life. Four steps in dealing with a waste problem are (1) waste saving (economy and substitution), (2) byproduct recovery, (3) combined treatment with municipal sewage, and (4) treatment of residual waste. The quality of final plant effluent depends on state and local regulations based on stream condition and use. (Sheffield-North Carolina State)
W70-03531

'AN ANSWER TO STREAM POLLUTION'-STREAM POLLUTION REDUCTION PROGRAM FOR FINISHING PLANT.

Textile Industries, Vol 121, No 7, p 71-73, 1957. 1 map, 1 fig.

Descriptors. *Treatment facilities, *Biochemical oxygen demand, Waste treatment, Economics, Activated sludge, Toxicity, Flow rates, Fish.
Identifiers: *Bleaching wastes, *Finishing wastes, Starch, Dyeing wastes.

The Hohokus Bleachery, Inc., using a new biological-type effluent-treatment plant, eliminates the oxygen depletion, discoloration, and odor caused by wastes in its discharge stream. Concentrated dyewaste residues are collected and removed from the premises, leaving bleaching and finishing wastes (peroxides and starches) for treatment. Before operation begins, the two aeration tanks are seeded with microorganisms, and sources of nitrogen and phosphorus for the biological processes are added. Raw waste is fed across the length of the tanks at a rate of two cubic feet/minute, allowing microorganisms to grow up to equilibrium. Compressed air enters the tank at a rate of 200 cubic feet/minute. In quiescent tanks, sludge settles out and clear effluent flows through a weir into the stream. The two tanks treat a total of 44,000 gallons/day, removing about 1,000 pounds of oxidizable material. The process requires no neutralization of waste before treatment and produces effluent of pH 7.9-8.3. The plant cost is one-third that of conventional plants, and maintenance-process control requires one man-hour/day. (Sheffield-North Carolina State)

THERMAL-HYDRAULIC STUDY - ARKANSAS COOLING RESERVOIR,
Bechtel Corp., San Francisco, Calif.
H. S. Riesbol, J. B. Anderson, F. H. Wend, and H. T. Holmes.
ASCE National Water Resource Meeting, Memphis, Tennessee, Jan 26-30, 1970. Preprint, 43 p, 17 fig, 9 ref.

Descriptors: *Cooling, *Reservoirs, *Heat transfer, *Heat balance, *Mixing, *Model studies, Arkansas, Thermal power plants, Nuclear power plants, Thermal pollution, Path of pollutants, Mathematical models, Hydraulic models, Diffusion, Turbulence, Jets.

The results are summarized of the analytical and thermal-hydraulic model investigations that were carried out to determine whether the plant heat load from an 850 megawatt nuclear power plant could be dissipated in Dardanelle Reservoir under Arkansas state-prescribed criteria and limitations. Based on the results of the analytical and thermal-hydraulic model investigations, it was shown that the plant heat load of 137.1 x 10gBtu/day can be dissipated in the reservoir. The analytical procedure employed yielded conservative temperature distribution patterns throughout the reservoir and demonstrated its potential, both as a basis for evaluation of thermal effects and as a tool for future refinement and development. The analytical procedure used was based on a turbulent-mixing mathematical model of a non-buoyant jet with an isothermal temperature. The results of the hydraulic and mathematical model studies were similar. Intake temperature was raised only about 1 deg F under critical conditions. (Novotny-Vanderbilt)

EVALUATION OF OPERATING PARAMETERS OF ALUMINA COLUMNS FOR THE SELECTIVE REMOVAL OF PHOSPHORUS FROM WASTEWATERS AND THE ULTIMATE DISPOSAL OF PHOSPHORUS AS CALCIUM PHOSPHATE,
Battelle-Northwest, Richland, Wash.
L. L. Ames.
Available from the Clearinghouse as PB-189 405, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-8, Cincinnati, Ohio, Mar 1969. 33 p, 17 fig, 5 tab, 19 ref. FWPCA Program 17010, Contract No 14-12-413.

Descriptors: *Filtration, *Tertiaryy treatment, *Phosphates, Sewage treatment, Nutrients, Separation techniques, Adsorption, Anion adsorption, Cation adsorption, Surfaces.
Identifiers: Phosphate removal, Alumina.

A synthetic secondary sewage effluent containing 10 to 30 mg/liter phosphate, 300 mg/liter bicarbonate, 112 mg/liter Cl and 50 mg/liter sulfate as anions and 130 mg/liter Na, 60 mg/liter Ca, 25 mg/liter each of K and Mg and 20 mg/liter ammonium as cations was used with 7.6 ml alumina columns to study the effects of various compositional changes on phosphorus removal. The phosphorus capacity was about half for the solution containing no Ca or Mg as compared to solutions containing them. Probably adsorption onto the alumina occurs partly as a calcium or magnesium phosphorus complex rather than as a simple phosphorus anion. Increasing the competing sulfate concentration in the influent solution to 4800 mg/liter showed little effect on phosphorus adsorption. Raising the pH of the synthetic sewage effluent to greater than 8.0 led to precipitation of calcium carbonate on the alumina grains which progressively lowered alumina phosphorus capacity. This problem was not encountered when using actual sewage effluent. It was found that alumina columns could be satisfactorily regenereated with NaOH. (Knapp-USGS)

5E. Ultimate Disposal of Wastes

ESTABLISHMENT OF TOWN SANITARY DISTRICTS.

Wis Stat Ann secs 60.305-60.315 (1957), as amended, (Supp 1969) 60.316 (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Water works, *Waste disposal, Domestic wastes, Sewers, Sewage treatment, Sewage disposal, Storm drains, Surface drainage, Algal control, Aquatic life, Water conservation, Public health, Water pollution, Contracts, Regulation, Right-of-way, Estimated costs, Legal aspects, Legislation, Sewage districts.

The town sanitary district commissions are required to project, plan, construct, and maintain systems of water works and garbage or refuse disposal, including sanitary sewers, surface sewers, or storm water sewers. They are authorized to provide for sewage collection and the chemical treatment of water for control of nuisance producing aquatic growths. They are to undertake improvements for the promotion of public health. They may require the installation of private sewage systems. Charges for services and methods of financing construction are discussed. The Department of Resource Development may establish town sanitary districts in areas where it finds existing facilities inadequate and where a menace to health or pollution of surface waters exists. This determination by the Department is subject to judicial review. (Duss-Florida)

5F. Water Treatment and Quality Alteration

RESEARCH ON TASTES AND ODORS,
A. A. Rosen.
Journal of American Water Works Association, Vol 62, No 1, p 59-62, Jan 1970. 4 p, 3 fig, 30 ref.

Descriptors: *Water quality, *Odor, *Taste, Biological properties, Potable water, Water pollution effects, Water properties, Laboratory tests, Water chemistry.
Identifiers: Water odor testing, Water taste testing.

Essentially all research on taste and odor in water is centered on the problems of odor. The most important progress has been made in the development of investigational techniques in an understanding of the role of specific industrial and natural organic chemicals in causing objectionable odors in water. Two of the most important natural odorants, metabolites of microorganisms, have been isolated and identified, or at least characterized in great detail. This identification is leading to more systematic water treatment, consisting of the use of tailor-made processes for the removal of specific odor contaminants. Sensory methods for the measurement and characterization of water odors are less actively investigated and have made relatively little progress in recent years. (Knapp-USGS)
W70-03440

HEALTH: WATER, SEWAGE, GARBAGE.

SC Code Ann secs 32-1201 thru 32-1335 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Sewage, *Septic tanks, *Water pollution, Water supply, Watershed management, Water sources, Environmental sanitation, Sewage disposal, Sanitary engineering, Streams, Waste disposal, Local governments, Administrative agencies, Water quality control, Inspection, Water pollution sources, Potable water, Domestic wastes, Structural design, Permits, Construction, Maintenance, Legislation, Legal aspects, Regulation, Watersheds (Basins).
Identifiers: *Garbage disposal, *Penalties (Criminal), *Privies.

To insure compliance with established water quality standards, all public or quasi-public water supplies must be periodically analyzed and the results reported to the State Board of Health. The Board shall also examine and inspect watersheds and water supplies and may publicize their findings. Construction permits issued by the Board are required for construction or modification of any public water treatment facilities or distribution systems. Provisions are made for protecting the water supply and regulating the sewer systems of Greenville County. The location and sanitation of privies located on watersheds of public water supplies are restricted. Manufacturing concerns which provide housing for their employees must include adequate sewage closet facilities. Requirements and regulations are established for the use of septic tanks in counties having cities with a population of seventy thousand or more. Special regulations are provided for septic tanks, garbage disposal, plumbing, sewage disposal, and the like on Pawley's Island and in Spartenburg County. Special permits are required for constructing or servicing any septic tank or other sewage disposal systems in Aiken County. (Dearing-Florida)
W70-03629

HEALTH: WATER, SEWAGE, GARBAGE (WATER SUPPLIES - WATER SUPPLY OF GREENVILLE).

SC Code Ann secs 32-1201 thru 32-1213 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Water supply, *Water works, *Water pollution, Water treatment, Water storage, Water distribution, Public health, Potable water, Permits, Administrative agencies, Standards, Engineering, Inspection, Bacteria, Chemical analysis, Water analysis, Testing, Water sources, Watershed management, Water pollution sources, Water conveyance, Dams, Legal aspects, Legislation, Regulation.
Identifiers: *Penalties (Criminal).

Permits from the State Board of Health are required for construction or modification of any

public or semi-public water treatment facility or water distribution system. The Board shall establish regulations and standards for the operation of waterworks systems and must inspect and approve any such facility before it begins operation. All public and semi-public water systems must be maintained in compliance with bacteriological and chemical water quality standards established by the Board. Every such water supply shall be periodically tested by the Board. The Board may enter and inspect all watersheds and water systems and may publish its findings. It is unlawful to: (1) trespass upon or deposit excreta in any source of public water supply or on the watershed of Greenville; (2) camp, hunt, fish, bathe, or wash in these sources or this watershed; (3) pasture any pigs or hogs or leave the carcas of any dead bird or animal on this watershed; (4) stop any vehicle unnecessarily or deposit any matter on any road within this watershed; or (5) destroy any water conductor of the Greenville water supply. Penalties are provided for failure to comply with these provisions. (Dearing-Florida)
W70-03630

HEALTH: WATER, SEWAGE, GARBAGE (PRIVIES, SEWAGE SYSTEMS, SEPTIC TANKS).

SC Code Ann secs 32-1221 thru 32-1270 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Septic tanks, *Watersheds (Basins), *Water sources, Environmental sanitation, Administrative agencies, Domestic wastes, Sewage disposal, Inspection, Legal aspects, Sewage, Construction, Installation, Maintenance, Engineering, Storage capacity, Structural design, Sanitary engineering, Waste water disposal, Effluents, Construction materials, Streams, Discharge, Pipes, Legislation.
Identifiers: Water closets.

All privies located on the watershed of any public surface water supply or within a specified distance from any house must be sanitarily maintained by designated persons in the manner prescribed by the State Board of Health. Sanitation inspectors designated by the Board may enter any premises for the purposes of inspection and may close any privy improperly maintained or constructed. Housing furnished to manufacturing employees by their employers must include properly constructed and maintained sewage closets. Sanitation of these closets and sewage connections is supervised by the Board. The State Board of Health shall establish specifications for septic tanks in counties which contain cities with a population greater than seventy thousand. These specifications shall incorporate statutory standards as to size, shape, liquid capacity, liquid depth, and detention period. Tanks with a capacity of one thousand gallons must be approved by the county health officer. Further regulations concern installation, construction materials, use of grease traps, distribution pipes and temporary tanks. No septic tank effluent may be discharged into any stream without approval from the county health officer. Penalties are provided for noncompliance with these provisions. (Dearing-Florida)
W70-03631

HEALTH: WATER, SEWAGE, GARBAGE (PAWLEY'S ISLAND, GREENVILLE COUNTY, SPARTENBURG COUNTY, AIKEN COUNTY).

SC Code Ann secs 32-1272 thru 32-1335 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Septic tanks, *Sewage disposal, *Domestic wastes, Permits, Administrative agencies, Construction, Sanitary engineering, Maintenance, Waste disposal, Water pollution sources, Streams, Rivers, Oceans, Construction materials, Tile drains, Plumbing, Potable water, Inspection, Warning systems, Legal aspects, Sewers, Water quality, Water quality control, Legislation.
Identifiers: *Toilets, *Tile fields, *Urinals, Slop sinks

No person may install or service a septic tank or other sewage disposal system in Aiken County without a permit from the governing body of that county. General regulations for garbage collection and disposal are provided. The State Board of Health shall regulate all sewers and septic tanks on Pawley's Island. No garbage, raw sewage, or drainage from any tile field may be deposited or discharged into the ocean, creeks, rivers, or marshes in the Pawley's Island area. All hotels, restaurants, inns, and boarding houses must provide safe drinking water and proper toilet facilities. Warning signs placed on unsafe facilities may not be tampered with. Adequate sewage facilities must be installed on premises where people reside or are employed in Greenville County. The Spartenburg County Board of Health shall regulate the quality of water supplies, sewage and garbage disposal, and commercial septic cleaning service in that county. The County Board shall require licenses for garbage collection and commercial septic tank services. (Dearing-Florida)

POSSIBILITIES FOR MINERALIZATION OF PESTICIDES (DUTCH),
J. K. Baars.
H2O, Vol 2, No 17, p 398-39, Aug 21, 1969. 2 p, 1 fig, 1 tab.

Descriptors: *Pesticide residues, *Pesticide Kinetics, *Adsorption, Path of pollutants, Pesticide toxicity, Translocation, Biodegradation, Pesticide removal, Water quality control.
Identifiers: Mineralization of pesticides.

The increasing use of pesticides with a high persistence under natural conditions creates a problem with great consequences. Although these components may disappear from their dissolved state for example by adsorption to rivermud or accumulation in vegetable material or animal tissue, it does not mean a general decrease in concentration. Only complete mineralization would really mean elimination. The molecular structure is the reason of this high persistence. Chlorinated hydrocarbons, such as aldrin, hexachlor, dieldrin, heptachlorepoxyde are an example of this. Compounds like parathion and diuron, although very toxic, can be considered as rather soft. The chlorinated compounds cannot be mineralized aerobically. Recently it has been shown that some of them can be broken down anaerobically. Persistent also under anaerobic conditions, were heptachlorepoxyde and dieldrin. The consequence of this is the necessity of research for substitutes that are degradable, which also gave the solution in the case of the hard detergents. (Knapp-USGS)

CONTROL OF BLUE-GREEN ALGAE BLOOMS WITH 2,3-DICHLORONAPHTHOQUINONE,
Wisconsin Univ., Madison. Dept. of Botany.
George P. Fitzgerald, and Folke Skoog.
Sewage and Industrial Wastes, Vol 26, No 9, p 1136-1140, Sept 1954. 1 fig, 1 ref.

Descriptors: *Algicides, *Cyanophyta, *Eutrophication, Wisconsin, Water quality control, Lakes, Water pollution sources, Chlorophyta, Nuisance algae, Fish, Zooplankton, Snails, Application methods.
Identifiers: *2,3-dichloronaphthoquinone, Microcystis, Aphanizomenon, Anabaena, Gloeotrichia, Janesville (Wis), Spaulding's Pond (Wis), Hydrodictyon, Najas, Anacharis, Lake Waubesa (Wis), Macrophytes, Algal growth.

Methods for application of the selective algicide 2,3-dichloronaphthoquinone (2,3-CNQ) and results of a large-scale test of its effectiveness in controlling excessive growths of cyanophytes (blue-green algae) in Spaulding's Pond, Wisconsin are reported. This highly eutrophic lake of 27 acres normally supports a continuous bloom of algae, principally Microcystis and Alphanizomenon, during summer. Spray applications of 2,3-CNQ suspensions, yielding concentrations of 30-55 parts per billion in the lake, clumped and killed heavy growths of cyanophytes. Such chemical treatment had no observable harmful effects on chlorophytes (green algae), higher aquatic plants, fish, or zooplankton. Some instances of rapidly recurring cyanophyte blooms required repeated applications. Lasting effects of treatment with 2,3-CNQ may be indirectly increased as a result of vigorous growth of chlorophytes and macrophytes which follows suppression of cyanophytes. (Eichhorn-Wisconsin)

PUBLIC HEALTH, POLLUTION CONTROL, AND PROTECTION OF NATURAL RESOURCES.

Wis Stat Ann secs 144.21-144.30 (Supp 1969).

Descriptors: *Wisconsin, *Treatment facilities, *Pollution abatement, *Project planning, Administrative agencies, Water pollution control, Water conservation, Natural resources, Wildlife conservation, Public health, Shoreline cover, Cities, Navigable waters, Lakes, Lake Superior, Lake Michigan, Fish, Aquatic animals, Environmental sanitation, Rivers, Domestic wastes, Standards, Regulation, Waste disposal, Financing, Beds, Waste treatment, Water treatment, Water quality, Water utilization.
Identifiers: *Air contaminant, *Emission.

A state program is created for financial assistance to municipalities in the construction of pollution prevention and abatement facilities. The types of activities to be financed by the program include preliminary planning, actual construction, and supervision of the anti-pollution facilities. Methods of financing and cost sharing between the state and municipalities are outlined. The Department of Resource Development, in cooperation with an advisory subcommittee and municipalities, is empowered to protect navigable waters. This plan is designed to promote healthful conditions, to prevent and control water pollution, to protect spawning grounds and aquatic life, to control placement of structures and land uses, and to preserve shore cover and natural beauty. The Department is to prepare a comprehensive plan to guide municipalities in regulating navigable waters and adjacent shorelands. Water use priorities governing the plan are listed in the statute. 'Solid waste' is defined to include garbage, refuse, and other discarded or salvageable solid materials; the term does not include solids or waste materials in waste water effluents or other common water pollutants. CLEANING OUR ENVIRONMENT--THE CHEMICAL BASIS FOR ACTION.

Chem Eng News, Vol 47, No 38, p 58-69, Sept 1969. 12 p.

Descriptors: *Environment, *Water pollution, *Cleaning, *Pollution abatement, Water pollution, Air pollution, Pesticides, Air pollution effects, Pollutants, Water pollution effects, Water pollution sources, Chemical engineering, Chemistry, Motor vehicles, Municipal wastes, Tertiary treatment, Public health, Solid wastes, Contamination, Ecology.
Identifiers: *Air pollution control, *Pollution control.

A summary and recommendations from the report of the subcommittee on environmental improvement of the ACS Committee on Chemistry and Public Affairs, presented at the American Chemical Society national meeting in New York City in Sept 1969, are given. The subcommittee had 2 goals: (1) to give an objective account of the current status of the science and technology of environmental improvement--what is known, how it is being used, what must be learned, and how it might be used; and (2) to analyze the information and recommend measures that, if adopted, should help to accelerate the sound development and use of that science and technology. A strong emphasis is placed on chemistry, chemical engineering, and the related disciplines. The full report contains 73 recommendations found in 4 principal divisions of the report: air environment, water environment, solid wastes, and pesticides in the environment. (USBR)

REPORT OF COMMITTEE ON POLLUTION.

Proceedings of the 56th Annual Convention Nat'l Rivers and Harbors Congress, p 8-13, May 13-15 1969. 6 p.

Descriptors: *Water pollution control, *Financing, *River basins, *Education, Water pollution, Water policy, Water quality, Water quality control, Water pollution sources, Pollution abatement, Pollutant identification, Pollutants, Saltation, Administrative agencies, Regulation, Waste treatment, Treatment facilities, Sedimentation, Sediments, Erosion, Erosion control, Coordination, River basin development.
Identifiers: National Rivers and Harbors Congress.

The general breakdown in pollution control appears to be lack of adequate funding at local, state, and federal levels. More public education concerning pollution is needed. Water storage for pollution abatement should be given the same weight in evaluation as other uses. A river basin approach to total problem solution is generally a sound basis of operation. The saltation problem should attract cooperation and support from more than just agricultural agencies. At this time the application of existing research results is more needed than additional research. A public information and education program should be a first priority. The water quality management program should use locally-oriented, cooperative efforts governed by standardized state and federal regulations. Land management practices should benefit soil conservation as well as water quality control. Approved standards must be implemented in water quality and quantity control measures. A lack of awareness, a poor attitude, and apathy are the greatest deterrents to pollution control. Erosion and other sediment sources are a major source of pollution and must be controlled. (Smith-Florida)

ENVIRONMENTAL LAW CONFERENCE PROPOSES NATIONAL LEGAL ACTION--INFORMATION CENTER.

Conservation Foundation Letter 9-69, p 1-11, Sept 30, 1969.

Descriptors: *Conservation, *Conferences, *Legal aspects, Public rights, Publications, Competing uses, Condemnation, Eminent domain, Legislation, Water conservation, Resources, Pollution abatement, Air pollution, Water pollution, Water pollution control, Water pollution effects, Cost-benefit ratio, Cost allocation.

A conference on law and environment in September, 1969, considered problems concerning the preservation of environment. Recommendations made to help the legal profession become more involved in the struggle for environmental quality included: (1) creation of an environmental law center and environmental law publication; (2) expansion of law school programs in environmental law; and (3) the encouragement by bar associations of greater interest in environmental law. Legal methods of eliminating influences destructive to the environment include abatement of nuisances and the use of the trust doctrine, which impresses a trust upon the state to preserve public and private lands for the benefit of the public. The opinion was expressed that the courts are ahead of legislatures in solving environmental problems. The difficulties previously encountered by private citizens in establishing standing in court to challenge public officials were said to be lessening. Other problems of private litigation discussed included the burden of proving environmental damage, the social utility of litigation, and expenses of suit. A specific topic discussed was the Santa Barbara oil spill. Expense of private suits in such cases was decided to the prohibitively high. (Dye-Florida)

POWERS OF THE WATER POLLUTION CONTROL BOARD.
Ohio Rev Code Ann secs 6111.01 thru 6111.05, 6111.07, 6111.08 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Water pollution, *Water pollution control, *Sanitary engineering, Legislation, Legal aspects, Sewage, Sewage disposal, Domestic wastes, Industrial wastes, Municipal wastes, Water resources development, Streams, Rivers, Lakes, Drainage, Drainage districts, Water pollution treatment, Pollution abatement, Public health, Waste treatment, Waste disposal, Federal government, State governments, Administrative agencies.

A Water Pollution Control Board is established within the Department of Health for the prevention, control, and abatement of water pollution. The Board is granted the power: to develop plans; to conduct research; to join in cooperative programs with other concerned agencies; to promulgate rules and regulations; to issue, revoke, or modify permits for the discharge of sewage and wastes; and to exercise all other incidental powers necessary to carry out the purposes of water pollution control. Pollution of the waters of the state is prohibited unless a permit is obtained from the Board. Procedures are established for the prosecution of violators. (Casey-Florida)
W70-03398

THE ORGANIZATION, PURPOSES, AND POWERS OF A SANITARY DISTRICT.
Ohio Rev Code Ann secs 6115.04, 6115.05, 6115.16 thru 6115.19 (Page 1953).

Descriptors: *Ohio, *Environmental sanitation, *Water policy, *Water supply, Legislation, Legal aspects, Water resources, Water pollution, Water resources development, Mosquitoes, Insect control, Domestic wastes, Public health, Streams, Sewage, Sewage districts, Streamflow, Channels, Construction, Watercourses, Drainage, Water purification, Taxes.

Upon petition in the manner prescribed by this statute, the court of common pleas of any county may establish within that county a sanitary district to prevent and control pollution, to regulate the flow of streams and channels for sanitary purposes, to provide for collection and disposal of sewage, garbage and other refuse, to provide a water supply, and to exterminate insects and destroy their breeding places. The board of directors of a sanitary district must secure approval of plans for improvement of the district. The board is authorized to enter upon private lands to carry out the purposes of the district. The board is not authorized to construct sewer systems for local service, but is limited to construction and maintenance of works necessary to improve district sanitation and water supply. (Casey-Florida)
W70-03399

DUTIES OF SANITARY DISTRICTS REGARDING POLLUTION, WATER SUPPLY, MOSQUITO CONTROL, AND INVESTIGATIONS OF RAINFALL AND STREAMFLOW.
Ohio Rev Code Ann secs 6115.23, 6115.24, 6115.26, 6115.27 (Page 1953).

Descriptors: *Ohio, *Environmental sanitation, *Water policy, *Water supply, Legislation, Legal aspects, Water resources, Sewage, Sewage districts, Water pollution, Water pollution control, Water utilization, Wastes, Mosquitoes, Public health, Federal government, Sewers, Streamflow, Rainfall, Drainage, Conservation, Water resources development, Insect control.

Authority is granted to the board of directors of each sanitary district to make and enforce regulations within the district regarding the design, construction and use of sewers; the uses and distribution of the water supply; the prevention of pollution or unnecessary waste of the water supply; the making of surveys and investigations of rainfall and streamflow; and the control, prevention, and elimination of mosquitoes and other insects, and their breeding places. Authority to cooperate with the federal government, the state government, and their agencies for these purposes is granted. Penalties for noncompliance with these regulations are established. OHIO VALLEY SANITATION COMPACT.
Tenn Code Ann secs 70-401 thru 70-409 (1956).

Descriptors: *Tennessee, *Interstate compacts, *River basin development, *Ohio River, Interstate rivers, Rivers, Streams, River basins, River basin commissions, Basins, Water resources development, Interstate commissions, Legislation, State governments, Administrative agencies, Navigable waters, Pollution abatement, Water pollution control, Standards, Water pollution treatment, Water pollution sources, Water pollution, Waste water treatment, Industrial wastes, Sewage.

The Governor is authorized to join the Ohio River Valley Water Sanitation Compact. The party states agree to cooperate in pollution control and abatement, to enact any legislation necessary for such purpose, and to maintain the Ohio River Basin's waters in a satisfactory sanitary condition. The Ohio River Valley Water Sanitation Commission and District are hereby created. It is recognized that no single standard for sewage treatment is applicable to all parts of the district, but pollution by sewage or industrial wastes shall not injuriously affect the various uses of the interstate waters of the basin. All sewage discharged into the basin shall be treated so as to remove all settleable solids and not less than forty-five percent of all suspended solids. All industrial wastes discharged into the basin shall be treated so as to protect the public health and preserve the waters for other legitimate purposes. The Commission may adopt regulations and standards for enforcing this article. The Commission shall make studies and recommendations to the party states. The Commission may order that the discharge of sewage or industrial wastes into interstate rivers be discontinued, modified or treated. (Smith-Florida)
W70-03415

TENNESSEE RIVER BASIN POLLUTION CONTROL.
Tenn Code Ann secs 70-1901 thru 70-1912 (Supp 1969).

Descriptors: *Tennessee, *Interstate compacts, *Water pollution, *Tennessee River, Interstate rivers, Legislation, Administrative agencies, Interstate commissions, River basin commissions, State governments, Pollution abatement, Water quality control, Standards, Sewage treatment, Waste treatment, Water utilization, Classification, Sewage, Industrial wastes, Judicial decisions, Administrative decisions, Financing.
Identifiers: *Tennessee River Basin.

The Tennessee River Basin Water Pollution Control Compact provides for the control and reduction of pollution in that area. A Commission is established to administer the Compact as an agency of each participating state. The Commission shall conduct surveys and make recommendations to the signatory states. Membership, administrative procedure, powers to deal with property, and the method of financing the Commission are provided. No single standard of sewage and waste treatment and no single standard of quality of receiving waters shall apply throughout the district. The standards established should reflect the present and proposed highest use of the waters. The Commission may establish interstate water quality standards for various classifications of use. Each signatory state will classify waters within its state upon approval by the Commission, and will establish programs for treatment of sewage and industrial wastes in accordance with these standards. The Commission, after investigation, notice and hearing, may recommend abatement action against reported polluters and may order polluting discharge by any municipality, corporation, person, or other entity to be discontinued. Any court of competent jurisdiction shall exercise its equitable powers to enforce and/or modify the order. (Dearing-Florida)

ECONOMIC EVALUATION OF WATER QUALITY, FINAL REPORT,
California Univ., Berkeley. Sanitary Engineering Research Lab
P. H. McGauhey, Jona Bargur, E. M. Lofting, and H. C. Davis.
Available from the Clearinghouse as PB-189 169, $3.00 in paper copy, $0.65 in microfiche. SERL Report No 69-8, Nov 1969. 117 p, 45 tab, 44 ref. FWPCA Program 16090DLU, (WP-00597-06).

Descriptors: *Economic evaluation, *Water quality, *Computer programs, Estuaries, *Input-output analysis, San Francisco Bay, *Mathematical models, Waste water treatment.
Identifiers: Water quality standards, *Systems analysis, Industrial effluents, Water management.

The tendency to set quality of the water resource rather than quality of discharges as the objective of environmental control makes it necessary to develop some relationship between concentration of individual pollutants in the resource and in the discharge in terms of characteristics of the receiving estuary. Moreover, the growing percentage of the water resource which is degraded in quality through beneficial use together with the increasing investment necessary to restore water quality, makes it important to minimize the cost of achieving water quality objectives. The study makes use of modern mathematical models, programming techniques, and input-output analysis to optimize quality control systems; and illustrates the use of the models by examples drawn from San Francisco Bay data and quality requirements.

POLLUTION ABATEMENT BY MORE EFFECTIVE LIGNIN UTILIZATION: GRAFTING TO LIGNIN AND LIGNIN-CONTAINING PULPS,
North Carolina State Univ., Raleigh. Dept. of Chemical Engineering.
R. B. Phillips, A. J. Kobayashi, W. Brown, and V. T. Stannett.
Available from the Clearinghouse as PB-189 292, $3.00 in paper copy, $0.65 in microfiche. Progress Report No 25, Water Resources Research Institute of The University of North Carolina, Jan 1970. 60 p. OWRR Project A-032-NC.

Descriptors: *Pulp wastes, *Lignins, *Industrial wastes, Water pollution control non-structural alternatives.

The problem of increased utilization of lignin has been approached from two directions: first, a procedure has been developed for grafting vinyl monomers to isolated lignin; second, grafting of hydrophilic monomers to pulps containing substantial amounts of lignin (high yield pulps) has been attempted. In the first case, styrene was successfully grafted by radiation to a commercially available lignin. In the more successful cases, the grafted product has the solubility behavior of polystyrene. While the reaction proceeds adequately in the presence of good swelling agents for the lignin, the expenditure of radiation is great (16 x 10 to the 6th power rads); on the other hand, grafting in the presence of large amounts of methanol speeds the reaction (3 x 4 x 10 to the 6th power rads), presumably because of a hindered radical termination rate. It was found that acrylamide could not be significantly grafted to unbleached kraft pulps containing even only 4% lignin. Consequently, a study was made of the strength properties of blends of highly grafted pure cellulose pulps and the ungrafted high yield kraft pulps. While the blends significantly improved the strength properties of the high yield pulp, the radiation involved and the amounts of the grafted pulp required were great, thus casting doubt on the economic feasibility of such a combination. (Howells-University of North Carolina)

PROCEEDINGS WORKSHOP ON WATER AND SEWER CHARGES AS RELATED TO WATER USE AND WASTE CONTROL.
North Carolina Water Resources Research Inst., Raleigh; North Carolina State Univ., Raleigh; and North Carolina Univ., Chapel Hill.
Available from the Clearinghouse as PB-189 289, $3.00 in paper copy, $0.65 in microfiche. Report No 30, David H. Howwells, (Ed), Water Resources Research Institute of The University of North Carolina, Oct 1, 1969. 120 p. OWRR Project A-999-NC.

Descriptors: *Municipal water, *Municipal wastes, *Industrial wastes, *Water rates, *Water pricing, Water demand, Water pollution control.
Identifiers: Sewer rates.

The objectives of this workshop were to: (1) assess current practices in setting water and sewer charges together with possible alternatives, (2) examine present and future objectives of municipal government in establishing water and sewer service charges, (3) consider the effect of water and sewer service charges on water use and waste disposal practices, and (4) review and discuss proposed research and extension activities related to water and sewer service charges. Participants included public works officials of North Carolina's larger cities, consulting engineers, university faculty and other interested persons. This is the third in a series of research workshops sponsored by the Institute to increase the communication between research users and researchers on water resource problems and research needs.

ACQUISITION OF LAND TO PREVENT CONTAMINATION.

Pa Stat Ann tit 53, sec 2992 (1957).

Descriptors: *Pennsylvania, *Condemnation, *Compensation, *Domestic water, Water pollution, Reservoirs, Pollution abatement, Cost repayment, Condemnation value, Public health, Water conservation, Streams, Local governments, Cities, Safety, Water quality, Legislation, Damages.

Any municipality, except third class cities, may acquire and hold lands which are contiguous to streams or reservoirs from which water is taken for public use when it is necessary to preserve the reservoirs from contamination. These lands may be acquired by purchase or condemnation. No land, however, shall be taken until just compensation has been made for property taken, injured, or destroyed. (Schram-Florida)
W70-03532

AUTHORITY OF CITIES TO DEVELOP SEWAGE SYSTEMS, AND TO IMPROVE LAKES AND WATERCOURSES.
Wis Stat Ann secs 62.18, 62.22 (1) (3), 62.23 (18) (1957).

Descriptors: *Wisconsin, *Cities, *Lake Michigan, *Riparian rights, Legislation, Legal aspects, Sewage treatment, Environmental sanitation, Waste treatment, Construction, Taxes, Government finance, Municipal waste, Lakes, Rivers, Streams, Navigable waters, Navigation, Natural resources, Public health, Condemnation, Sewage districts, Sewers.

Cities are given the authority to construct, maintain, and improve systems of sewerage, including sewage disposal plants, and may join in cooperative efforts with adjacent municipalities of a bordering state in these endeavors. Authority for surveys, plans, and construction of sewers and sewer districts is provided. A special sewer district tax power to finance these projects is granted. A city may take or destroy any riparian rights appurtenant to land abutting Lake Michigan whenever necessary for a public improvement. A city may improve lakes, rivers, and other navigable streams, where such improvements are in aid of navigation, or are for protection of public health and welfare, or wildlife. (Casey-Florida)

WATERWORKS AND SEWERAGE.
Wis Stat Ann secs 145.04 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Sewage disposal, *Municipal wastes, *Public health, Cities, Sewage, Waste water disposal, Water supply, Water tanks, Waterworks, Pipes, Plumbing, Inspection, Regulation, Utilities, Leakage, Buildings, Standards, Permits, Administrative agencies, State governments.
Identifiers: *Sanitary district.

Townships, counties, metropolitan sewerage commissions and certain cities may prescribe ordinances concerning waterworks and sewerage in order to safeguard public health. These are not to conflict with minimum standards for pipes, tanks, and fixtures by which fresh water, waste water, or sewage is carried. No such waterworks are to be placed in buildings except in accordance with plans approved by the Board of Public Works or Board of Health. No blumbing shall be done, except repairing leaks, without permit. No municipal sewerage commission or other agency shall require licensing of anyone licensed under this chapter or prohibit such person from doing business within the scope of his permit. Authorities of sewerage districts shall report the failure of any licensed plumber to qualify as a journeyman or master plumber to the State Board of Health. (Duss-Florida)

LEGAL VIEWPOINT (WATER STANDARDS),
Frank E. Maloney.
Am Water Works Ass'n J, Vol 52, No 9, p 1180-88, Sept 1960. 9 p, 61 ref.

Descriptors: *Potable water, *Water policy, *Public health, *Water quality, Standards, Impaired water quality, Domestic water, Water law, Water quality control, Water supply, Florida, Cities, Administrative agencies, Federal government, Fluoridation, Water purification, Wastes, Water pollution, Water Quality Act, Legislation, Water requirements, Water treatment, Industrial use, Water works.
Identifiers: *Water quality standards.

Due to the endorsement by so many national organizations concerned with water supply and public health, the Drinking Water Standards of the USPHS have had a tremendous impact throughout the United States. Public health legislation, under the police power, has been enacted in many states - with the USPHS standards serving as guidelines. State boards of health have been generally utilized for implementing and maintaining these standards. Municipal corporations may also enact ordinances relating to water supply and purity. Generally, the courts have upheld these delegations of power when they are necessary for the protection of public health. Although the greatest area of litigation in this field has been with respect to fluoridation, no court has thus far prohibited it. Complying with the USPHS standards could be an effective means for minimizing the liability of water purveyors for negligence. Developments in the area of implied warranty suggest that liability may be extended to include water suppliers. A brief review of the law in these areas is included. Widespread respect for the USPHS standards seems to dictate that any drastic change be limited to prohibiting contaminants which can clearly be shown to pose a threat to the public health. MATHEMATICAL MODEL OF SEWAGE SLUDGE FLUIDIZED BED INCINERATOR CAPACITIES AND COSTS,
General American Transportation Corp., Niles, Ill.
G. J. Ducar, and P. Levin.
Available from the Clearinghouse as PB 189 295, $3.00 in paper copy, and $0.65 in microfiche. FWPCA Ohio Basin Region, Robert A. Taft Water Research Center, Report TWRC-10, Advanced Waste Treatment Research Laboratory, Cincinnati, Ohio - Sept 1969. 72 p, 4 tab, 32 fig, 57 ref. FWPCA Program 17090; FWPCA Contract 14-12-415.

Descriptors: *Mathematical models, Computer models, *Sewage sludge, Incineration, Sludge disposal, Evaluation, *Capital costs, *Operating costs, *Maintenance costs.
Identifiers: Fluidized bed incineration.

The development of a computer program to evaluate sewage sludge fluidized bed incineration systems is described. Data for the program was collected from manufactures, a literature survey and field trips to operating installations. Most of the data was obtained from the field because of the lack of available information from the other sources. More than fifty correlation relationships were attempted before the necessary data could be reasonably represented. Equations were developed for the least square curves which fitted the data best. These equations were used as the basis for the computer program developed to size some of the major components and to estimate capital, operating and maintenance costs for the fluidized bed incineration system.

AN ECONOMIC APPROACH TO REGIONAL INDUSTRIAL WASTE MANAGEMENT,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
Benjamin C. Dysart, III.
Paper presented at 24th Purdue Ind Waste Conf, Purdue Univ, May 6-8, 1969. 24 p, 12 fig.

Descriptors: *Industrial wastes, *Economic efficiency, *Resource allocation, *Dynamic programming, *Water quality control, Dissolved oxygen, Planning, Management, Water utilization, Streams, Constraints, River basins.
Identifiers: Industrialized basin.

An economic approach to regional industrial waste management was presented. Two problem levels were considered; a resource allocation problem for which waste assimilative capacity was allocated to among competing users and the objective was economic efficiency with dissolved oxygen standards (DO) as constraints. The second problem level consisted of investigating the response on sensitivity of the minimum total system cost and the optimal management policy to system variation. A hypothetical river basin system consisting of three stream reaches or stayes in series with an industrial waste outfall located at the upstream end of each stage was used to illustrate the two problem levels. A dynamic programming technique was found to be useful in determining the minimum-cost management systems that met all constraints for a fixed system configuration. (Thiuri-Cornell)

AERATION OF STREAMS WITH AIR AND MOLECULAR OXYGEN,
Crown Zellerbach Corp., Camas, Wash.
H. R. Amberg, D. W. Wise, and T. R. Aspitarte.
Tappi (Technical Association of Pulp and Paper Industry), Vol 52, No 10, p 1866-71, Oct 1969. 6 tab, 5 fig, 7 ref.

Descriptors: *Aeration, *Dissolved oxygen, *Oxygen, Water quality control, Diffusion, Pollution control.
Identifiers: *Instream aeration.

Results are given on full scale river aeration by two methods (a) release of oxygen into hydroelectric turbines, and (b) diffusion of gaseous oxygen into water under pressure. Oxygen is approximately five times as effective as an equal quantity of air in imparting dissolved oxygen to streams. The authors consider that provided the oxygen is procured at $30 per ton dissolved oxygen can be added to the water at a total cost of 3 - 4 cents per pound. (Whipple-Rutgers)
W70-03625

CONSERVANCY DISTRICTS (WATER QUALITY MANAGEMENT AND PROTECTION).

Ohio Rev Code Ann secs 6101.13, 6101.15, 6101.19 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Administrative agencies, *Water pollution, *Water pollution treatment, Wastes, Liquid wastes, Water supply, Water utilization, Sewage, Sewage disposal, Sewage treatment, Ditches, Sewers, Drains, Rivers, Streams, Flow, Construction, Dams, Dikes, Sluices, Bridges, Water works, Treatment facilities, Supervisory control (Power), Cost analysis, Legislation, Legal aspects, Diversion.
Identifiers: *Conservancy districts, *Purification works, Penalties (Civil).

The board of directors of conservancy districts shall prepare plans for water improvements for their districts. Unless requested by the governing bodies of municipal corporations such plans shall not provide a water supply system or system for sewage disposal. The board of directors has supervisory control over the implementation of plans. In order to accomplish water quality and quantity control, a board may: alter any watercourse, ditch, sewer, river, or stream; fill up the same and divert

water flow; construct necessary structures for water control and waste treatment; and construct connections to works for the delivery of water supply or sewage. For these purposes, a board may also acquire, sell, or control real or personal property. A board may make such regulations as are necessary to protect improvements in conservancy districts. It may prescribe regulations for: construction of structures; the connection of sewers, ditches or pipelines with the works of a district; the permissible uses of the water supply; and the discharge of liquid and solid wastes into sewers. Persons violating such regulations shall be liable for their damage. (Duss-Florida)

THE ISSUE OF THE LAKEFRONT, AN HISTORICAL CRITICAL SURVEY,
Douglas Schroeder.
Chicago Heritage Committee Newsletter, No. 5, 1964. 33 p, 31 ref.

Descriptors: *Lake Michigan, *Lake shores, *Recreation, *Planning, *Beaches, Lakes, Shores, Recreation facilities, Land forming, Landscaping, Compensation, Beach erosion, Littoral drift, History.
Identifiers: *Chicago, Illinois.

This study discusses the failure of the Chicago Park District to provide adequate planning for the Lakefront Park System. A historical survey of the development of the Chicago lakefront is used as a vehicle to provide the context for present planning as well as illustrate good planning in the past. A number of objectives for a comprehensive plan of the lakefront are outlined (1) separation of pedestrian and vehicular traffic; (2) subordination of roadways and parking lots to pedestrian usage; (3) elimination of non-conforming commercial usage; (4) provision for location of desirable commercial concessions, i.e., restaurants, boating, etc.; (5) provision for location of new institutions, i.e., museums, art galleries, athletic fields, etc., and their parking and servicing elements; (6) adequate controls to guarantee that if park land is taken for non-park usages such as superhighways, compensatory land near that taken will be given for park land; (7) integrated design of all park elements including signs, street lighting, beaches, etc.; and (8) a capital improvements program for accomplishing plans and allocating resources. This report illustrates some of the difficulties encountered in lakefront planning. (Davis-Chicago)
W70-03338

FLOOD PLAIN MANAGEMENT--WHEREIN LIES THE MYTH,
Office of the Chief of Engineers (Army), Washington, D.C.
George R. Phippen.
Paper presented at the Seventh Biennial Hydraulics Conference, Washington State Univ., Pullman, Wash., 14 Nov 1969. 17 p, 3 fig.

Descriptors: *Flood control, *Flood damage, *Flooding, *Flood plains, Flood protection, Damages.
Identifiers: *Flood plain management.

A flood plain management program should be a comprehensive program, thought of in terms of objectives rather than the means of achieving these objectives. The foundation for understanding flood plain management is the flood hazard; a function of flooding and the susceptibility to damage and disruption. Flooding is described by those physical attributes such as area involved, depths involved, hydro-dynamic and hydro-static aspects, time aspects, and pollution and debris aspects. The susceptibility to damage and disruption represents the degree to which cultural features; structures, crop land, continuity of business, etc.; are affected by flooding. Two additional principles of intelligent flood plain management are the nature of and need for stating objectives requiring resolution of the hazard and fitting the flood plain into a larger scheme; and the kinds of optional means available for achieving objectives. It is concluded that flood control myth, is dispelled when flood control is viewed in this larger context of flood plain management. (Davis-Chicago)

INHERENT DIFFERENCE BETWEEN WATER AND OTHER NATURAL RESOURCES.
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
Earnest Boyce.
Journal, Water Poll Contr Fed, Vol 41, No 10, p 1697-1701, Oct 1969.

Descriptors: *Water resources development, *Natural resources, *Water development, Water rights, Water law, Planning.

An attempt has been made (a) to point out some of the special problems of water control and development that make this resource inherently different from others and (b) to indicate a few of the legal aspects of these special problems. As a resource, water is a requirement so basic to man's existence that all other resources are either dependent on its plentiful supply or, in its absence, valueless for man's use and development. While many natural resources vanish with use, most water usages produce changes in the position, quality, and/or quantity of the water, depending on how it is used. The multiple usage of the resource, water, within one hydrologic cycle, is frequently an economic necessity. A final distinction is the unpredictable variations in the quantity available from rain and snowfall in any period of time and in any locality. This hydrologic variation is compounded by the variation of human use which is frequently in conflict with the hydrologic variation. This conflict is resolved by some form of water development and management scheme. However, the increase in water use tends to create legal difficulties based on the inadequacies of existing water laws in the case of greater demand than supply. (Davis-Chicago)
W70-03348

SOCIAL BENEFIT VERSUS TECHNOLOGICAL RISK,
California Univ., Los Angeles.
Chauncey Starr.
Sci, Vol 165, No 3899, p 1232-1238, Sept 1969. 7 p, 7 fig, 12 ref, append.

Descriptors: *Risks, Social aspects, *Social values, Project benefits, Public health, Public works, Public benefits, Technology, Accidents, Welfare (Economics), *Hazards, *Safety, Benefit-cost ratios, *Benefits, Acceptability, Comparative benefits, Optimum development plans, Economic justification, Economics, Planning.
Identifiers: Social acceptance, Technical resources, Engineering works.

The evaluation of technologic developments normally relates the expected technical performance to the required investment of resources. Such performance/cost relationships are useful for choosing between alternative solutions, but do not determine how much technology a society can justifiably purchase. A knowledge of the relationship between social benefit and justified social cost is needed to determine the optimum investment of resources. An approach is presented for measuring benefit relative to cost, specifically for accidental deaths arising from technological developments in public use. The analysis is based on 2 assumptions: (1) historical accident records reveal consistent patterns of fatalities in the public use of technology, and (2) historically revealed social preferences and costs are sufficiently enduring to permit use for predictions. Comparisons are made between risks and benefits to evaluate the willingness of society to accept risks. The method provides an approach for answering the question of how safe is safe enough, and may be a means of giving insight on social benefit relative to cost that is so necessary for judicious material decisions on new technological developments. LAND AND WATER CONSERVATION FUND ACT.

Federal Assistance in Outdoor Recreation, Publication No 1, 1968. 99 p.

Descriptors: *Administrative agencies, *Water resources development, *Water conservation, *Water quality control, Federal government, Planning, Recreational facilities, Cost allocation, Land reclamation, Wildlife conservation, Aquatic life, Ecology, Soil conservation, Sedimentation, Erosion, Drainage, Public health, Flood control, Natural resources, Reservoirs, Navigation, Fish management, Meteorology, Grants, Watersheds (Basins).

The Land and Water Conservation Fund Act provides for grants to states and their subdivisions for planning, acquisition, and development of public outdoor recreation areas and facilities. Various federal agencies play a role in the implementation of this program including: the Departments of Interior, Agriculture, Commerce, Defense, Housing and Urban Development, Labor, and Transportation; the Appalachian Regional Commission; the Office of Economic Opportunity; the Tennessee Valley Authority; and the Department of Health, Education, and Welfare. Planning and Research are priorities in the act, both on the state and federal level. Cost sharing and allocation provisions for the various projects are included. Priorities in the implementation of projects include: natural beauty, fish and wildlife conservation, water resources development, water pollution control, soil conservation, land reclamation, public health, water supply, and general ecological considerations. The transfer of land from the federal government to the states for recreational purposes is permitted. Federal agencies are instructed to provide techical assistance to the states in the planning and construction of projects. (Duss-Florida)
W70-03390

LAND AND WATER CONSERVATION FUND ACT (DEPARTMENT OF INTERIOR).
Federal Assistance in Outdoor Recreation, Publication No 1, 1968. 21 p.

Descriptors: *Administrative agencies, *Recreation facilities, *Water resources development, *Water conservation, Planning, State governments, Federal government, Land reclamation, Financing, Public health, Fish management, Wildlife management, Fisheries, Aquatic life, Lakes, Flood control, Water quality control, Water pollution control, Water supply, Waste treatment, Geological surveys, Research, Navigable waters, Ecology, Hydrology.

To qualify for federal grants, states must prepare comprehensive outdoor recreational plans to be approved by the Bureau of Outdoor Recreation. In administering this act, the Bureau is to give special consideration to natural beauty and other qualitative aspects of environment. Among its duties the Bureau is to promote coordination of recreation programs, determine costs and benefits attributable to recreation, and develop policies related to wildlife, waterfowl, natural beauty, and recreational areas. The cost of transfer of federal land to states by purchase or lease is outlined. The Bureau of Sports Fisheries and Wildlife is to assist states and other organizations in realizing the potential of fish and wildlife resources. Funds are allocated and technical assistance is provided for the restoration of fish and wildlife resources. Programs include development of anadramous fish resources, fish hatcheries, and water resource development projects. The Federal Water Pollution Control Administration is to develop plans and programs to assure adequate water supply of the quality necessary for public, industrial, recreational, and conservation needs. The Geological Survey conducts investigations to determine the best use of the nation's water resources. The survey measures the flow and sediment discharge of rivers, reservoir contents, the chemical quality and temperature of waters, and determines the availability of water supplies. Appropriations are made to states for Water Resources research and training. (Duss-Florida)
W70-03391

LAND AND WATER CONSERVATION FUND ACT (DEPARTMENT OF AGRICULTURE).
Federal Assistance in Outdoor Recreation, Publication No 1, p 21-34, 1968. 14 p.

Descriptors: *Administrative agencies, *Recreation facilities, *Water conservation, *Water resources development, Watershed management, Cost sharing, Erosion control, Sedimentation, Streams, Lakes, Reservoirs, Irrigation districts, Drainage districts, Construction, Fishing, Wildlife conservation, Water pollution control, Flood control, Legal aspects, Financing, Water management, Rural areas, Public lands, Farm management, Impoundments, Impounded waters.

The Department of Agriculture and its subdivisions have a major interest in programs for outdoor recreation. The Soil Conservation Service provides technical assistance to landowners and helps states in the development of water-based recreational areas. The Agricultural Research Service conducts research on the production of food and conservation of soil and water resources. Projects include: control of disease, insects, and weeds; soil and water management to minimize erosion and sedimentation of streams and reservoirs; and recreational planning. The Agricultural Stabilization and Conservation Service under the Agricultural Conservation Program (ACP) shares costs with farmers to carry out soil, water, woodland, and wildlife conservation projects. Water impoundment projects help to improve hunting and fishing and water resources. Cropland adjustment and conversion programs are encouraged to divert land to recreational use and conservation needs. Financing of projects by associations and individuals is permitted. Loans are available for watershed projects carried out by state conservation, drainage, irrigation, or flood prevention districts. Cost sharing is also available for providing sanitary facilities and facilities needed for recreation. (Duss-Florida)
W70-03392

LAND AND WATER CONSERVATION ACT (DEPARTMENTS OF COMMERCE AND DEFENSE).
Federal Assistance in Outdoor Recreation, Publication No 1, p 35-46, 1968. 11 p.

Descriptors: *Administrative agencies, *Recreational facilities, *Water resources development, *Water conservation, Tourism, Natural resources, Fish conservation, Wildlife conservation, Reservoirs, Tides, Charts, Weather forecasting, Warning systems, Navigation, Estuaries, Channels, Harbors, Flood control, Streamflow, Flood plains, Regulation, Regulated flow, Boating, Shore protection, Projects, Financing.
Identifiers: Corps of Engineers.

The Business and Defense Services Administration will give information to businessmen concerning equipment and facilities used in outdoor recreation. Economic development programs for substandard areas, controlled by the Department of Commerce, may be devoted to tourism, recreation, and fish and wildlife. The Environmental Science Services Administration (ESSA) produces charts required in marine navigation. The charting program includes investigation of navigational hazards, prediction of tides and tidal currents, and research and development. The ESSA, through the Weather Bureau, is responsible for keeping the public informed of weather conditions influencing recreational activities. It accomplishes this by means of weather forecasts including river forecasts, flood warnings, and flow information. The United States Army Corps of Engineers is in

charge of projects concerning navigation, flood control, hydroelectric power production, shore restoration and protection, water supply, streamflow regulation, fish and wildlife conservation, and recreation. The Secretary of the Army is authorized to grant leases of project lands to nonfederal governmental bodies without charge. Administration of recreational water resources projects shall be on a cost sharing basis. The Corps of Engineers plans and constructs harbors and channels for purposes of navigation and prepares charts of the Great Lakes. The federal government assumes the cost of restoration and protection of federally owned shores. (Duss-Florida)
W70-03393

LAND AND WATER CONSERVATION FUND ACT (THE APPALACHIAN REGIONAL COMMISSION, TENNESSEE VALLEY AUTHORITY, THE WATER RESOURCES COUNCIL, AND CERTAIN DEPARTMENTS).

Federal Assistance in Outdoor Recreation, Publication No 1, p 47-99, 1968. 53 p.

Descriptors: *Administrative agencies, *Recreational facilities, *Water pollution control, *Water resources development, Planning, Abatement, Research, Potable water, Environmental sanitation, Solid wastes, Water supply, Water utilization, Projects, Conservation, Health, Cost sharing, Natural resources, Legal aspects, Navigation, Wildlife management, Reservoirs, Fishing, Public rights, Reclamation, Flood control, Bodies of water.

Under the Department of Health, Education, and Welfare, the National Center for Urban and Industrial Health has instituted programs for environmental sanitation, solid waste disposal, water supply, and sea resources. The Department of Housing and Urban Development is authorized to assist in recreation projects. There is an Open-Space Land Program for these purposes. Recreation projects may include improvement of parks and waterfront areas and construction of rain shelters and sanitary facilities. The Department of Transportation is to strive for a system of highways which serves to promote roadside development and highway access, and which focuses attention on outdoor recreation. Priorities in this include conservation of recreation, natural resources, and fish and wildlife. The United States Coast Guard is responsible for enforcement of federal laws on the high seas and in United States waters. It further functions to aid navigation and water safety. The Appalachian Regional Commission initiates project proposals and plans for the region, many of which are to benefit recreation and fish and wildlife resources. The Tennessee Valley Authority is to encourage the development of recreation resources resulting from its construction of a water control system. The Water Resources Council administers a program of grants to states to assist in the development of water and land related resource plans. (Duss-Florida)
W70-03394

WATER RESOURCES.
Tenn Code Ann secs 70-2001 thru 70-2005 (Supp 1969).

Descriptors: *Tennessee, *Water conservation, *Water resources, *Water resources development, Legislation, Administrative agencies, Administration, Water policy, Water pollution, Water supply, Water rights, Dams, Recreation, Environmental sanitation, Navigation, Resource development, Conservation, Optimum development plans, Water requirements, Competing uses, Engineering personnel, Water pollution control.

A Water Resources Division is created within the Department of Conservation. The Commissioner of Conservation shall appoint a professional water engineer to head this Division. The engineer shall be responsible for all matters relating to the conservation, protection, and development of the water resources of the state, as well as the creation and development of a long range water resource policy. Special matters of water pollution control are reserved for the Stream Pollution Control Board. Specific duties of the engineer include the authority to: (1) establish, maintain and publish an inventory of the state's water resources; (2) establish estimates of existing and future water use in the state; (3) propose necessary water control districts; (4) create and define the rights of respective competing users of water resources; (5) perform assigned duties relating to determining waters that should be reserved for general public purposes; (6) determine the feasibility of proposed dams; and (7) perform other duties required by the Commissioner of Conservation. Any person withdrawing fifty thousand or more gallons of water per day from the water resources of the state must register such withdrawal when required by the Water Resources Division. (Schram-Florida)
W70-03421

TENNESSEE-TOMBIGBEE WATERWAY DEVELOPMENT COMPACT.
Tenn Code Ann secs 70-2101 thru 70-2104 (Supp 1969).

Descriptors: *Tennessee, *Interstate compacts, *River basin development, *Tennessee River, Interstate rivers, Rivers, Streams, River basins, River basin commissions, Basins, Water resources development, Optimum development plans, Transportation, Interstate commissions, Federal government, Legislation, State governments, Administrative agencies, Navigable waters, Navigable rivers, Channels, Channel improvement, Alabama, Mississippi, Navigation.

The Governor is authorized to execute this compact with Alabama and Mississippi. The purpose of this compact is to promote the development of a navigable waterway connecting the Tennessee River, Tombigbee River, Mackeys Creek, and Yellow Creek so as to provide a nine-foot navigable channel between Demopolis, Alabama and Pickwick Pool, Mississippi, and establish an interstate authority to assist in these efforts. The Tennessee-Tombigbee Waterway Development Authority is hereby created. The Authority is empowered to: hold hearings, conduct studies and surveys of all matters concerning development of the Tennessee-Tombigbee Waterway, acquire money and property for use in the program, cooperate with other public or private groups with an interest in the area, execute plans and policies for putting the purpose of this compact before Congress and other federal agencies, and exercise such other powers as may be appropriate to carry out the purposes of this Compact. All officers of this state are directed to do all things within their jurisdiction to aid in carrying out the purposes of this Compact. (Smith-Florida)

WATER DEVELOPMENT AUTHORITY.

Ohio Rev Code Ann secs 6121.01 thru 6121.05 (Page Supp 1970).

Descriptors: *Ohio, *Administrative agencies, *Water resources development, *Water pollution control, Beneficial use, Water resources, Water quality, Pollution, Abatement, Public health, Sewage, Industrial wastes, Waste water, Water management, Waste treatment, Costs, Construction, Projects, Surface waters, Groundwater, Water utilization, Solid wastes, Aquatic life, Wildlife, Bodies of water, Flow.
Identifiers: *Water development authority.

Various terms related to water resources and water conservation in Ohio are defined including: beneficial use, waters of the state, water resources, water development project, pollution, industrial waste, waste water, waste and water management facilities. It is the state policy of Ohio to conserve, develop, utilize and maintain its water resources; to prevent or abate water pollution; and to promote the beneficial use of state waters. Pursuant to this policy, the Ohio Water Development Authority is created. The Authority may make loans or grants to governmental agencies for the acquisition or construction of water development projects. It may establish rules and regulations for use of water development projects. It may also establish rules and regulations to protect augmented flow in state waters brought about by development projects, and may provide standards for withdrawal of augmented flow. Methods of financing, operation, and supervision of water development projects are described. The Authority may engage in research and development with respect to waste water and water management facilities. (Duss-Florida)

GREAT LAKES BASIN COMPACT.

Ohio Rev Code Ann secs 6161.01 thru 6161.03 (Page Supp 1970).

Descriptors: *Ohio, *Interstate compacts, *Water resources development, *Water conservation, Great Lakes, Basins, Navigation, Water supply, Recreation, Water utilization, Legislation, Fisheries, Wildlife conservation, Fish conservation, Regulation, Flood plain zoning, Harbors, Water levels, Research, Water pollution control, Soil erosion, Bank erosion, Floods, Interstate commissions, Diversion, United States, Administrative agencies.
Identifiers: *Great Lakes Commission.

The Great Lakes Basin Compact is herein ratified and enacted. The purposes are to: promote the development, use, and conservation of water sources of the Great Lakes Basin; to derive maximum benefit from public works related to navigation and other activities; and to advise in securing a proper balance among the various legitimate uses of water resources. The Compact will be effective when enacted by the legislatures of any four of the states of Illinois, Indiana, Michigan, Minnesota, New York, Ohio, Pennsylvania, and Wisconsin. Pursuant to this Compact a Great Lakes Commission is created, and its composition and method of operation are described. The Commission has the power to: collect and interpret data on water resources; make recommendations on water resources development and conservation; consider the need for public works related to water resources; consider means of improving navigation and improving and maintaining fisheries; and recommend policies related to water resources. Each state shall consider the Commission's recommendations concerning: stabilization of lake levels; measures for combating pollution, floods and beach erosion, navigation aids and improvements; cooperative fishing laws and fish management; cooperative programs for soil and bank erosion; and diversion of waters. (Duss-Florida)
W70-03577

SOIL AND WATER CONSERVATION COMMISSION.

Ohio Rev Code Ann secs 1515.01 thru 1515.14 (Page 1964), as amended, (Supp 1970), secs 1515.15 thru 1515.29 (Supp 1970).

Descriptors: *Ohio, *Flood control, *Water resources development, *Water conservation, Administration, Soil conservation, Administrative agencies, Legislation, Legal aspects, Natural resources, Regulation, Financing, Planning, Surveys, Investigations, Flood damage, Soil erosion, Taxes, Water utilization, Construction, Cost sharing, Water pollution control, Pollution abatement, Operation and maintenance.

The Soil and Water Conservation Commission is established with the following duties and powers: (1) to assist and encourage cooperation between the soil and water conservation district supervisors; (2) to disseminate information to district supervisors; (3) to seek the cooperation and assistance of federal agencies on behalf of the districts; (4) to recommend legislation which will encourage proper management of natural resources; and (5) to recommend to the Director of the Department of Natural Resources priorities for planning and construction of small watershed projects. Landowners within a given territory may petition the Commission to establish a district within that territory. If the Commission determines there is a need for the district it may order a referendum to be held. Once a district is created, supervisors will be elected in the manner set forth. District supervisors have the following powers: (1) to conduct surveys, investigations, and research relating to soil and water conservation and flood control; (2) to draft and implement plans for conservation of soil and water resource and for flood control; and (3) to cooperate with land occupiers in carrying out the foregoing powers. Financing of district projects is provided for through taxation, special assessments, and bond issues. (Keith-Florida)

ANALYSIS OF MANAGERIAL, FINANCIAL, AND REGULATORY FUNCTIONS OF REGIONAL WATER RESOURCES AUTHORITIES AND OTHER INSTITUTIONAL ARRANGEMENTS.
Booz-Allen and Hamilton, Inc., Washington, D.C.

Available from the Clearinghouse as PB-189 339, $3.00 in paper copy, $0.65 in microfiche. Technical Completion Report, Jan 1970. 99 p, 15 tab, 1 fig, 91 ref, 3 append. OWRR Project C-1370 (1974).

Descriptors: *Administrative agencies, *River basins, *Management, Planning, Federal Government, State government, Local government, Compacts, Water rights.
Identifiers: *Organizational arrangements, Interagency committee, River basin commission, Private corporation, Special districts, Federal regional agency.

An analysis was made of different types of regional water resources institutional arrangements in an attempt to describe the distinguishing characteristics of each and to ascertain their inherent strengths and weaknesses. Seven river basins were selected to provide examples of the implementation of six different regional arrangements. An analysis of each of the seven basins is presented with primary emphasis placed upon the organizational arrangements that have evolved for planning and operating. The selected basins were: (1) the Colorado River Basin, (2) the Columbia River Basin, (3) the Miami River Basin, (4) the Wisconsin River Basin, (5) the Delaware River Basin, (6) the Tennessee River Basin, and (7) the Colorado River Basin (Texas). Major conclusions include: (1) the river basin commission, the intrastate special district, and the federal interstate compact hold the most promise for river basin development, (2) the federal regional agency is an effective arrangement but implementation difficulties prohibit its widespread use, and (3) the major weakness of the basin interagency committee arrangement is its lack of authority to implement the plans created.

THE ROLE OF RESERVOIR OWNER POLICIES IN GUIDING RESERVOIR LAND DEVELOPMENT,
North Carolina Water Resources Research Inst., Raleigh.
Raymond J. Burby, III.
Available from the Clearinghouse as PB-189 408, $3.00 in paper copy, $0.65 in microfiche. Interim Report, North Carolina Water Resources Research Institute, Report No 29, Nov 1969. 56 p. OWRR Project B-012-NC.

Descriptors: *Reservoirs, *Recreation, *Land development, *Lake shores, *Local government, *Planning, *Land use, *Land management, Forest management, Southeast U. S., Inter-agency cooperation, Recreation facilities, Zoning, Urbanization, *Water resources development, Developed waters, Aesthetics.
Identifiers: *Reservoir owners, Land acquisition, Residential use, Commercial use, Industrial use.

Land adjoining reservoirs with recreation potential has been developed at an increasing rate since 1960. A survey of 105 large multipurpose reservoirs in the Southeast indicated that these reservoirs have attracted over 60,000 homes and summer cottages. This rapid development is occurring in a governmental vacuum. Under ten percent of the reservoirs surveyed have land use plans, zoning, or subdivision regulations to guide the development of adjacent non-public land. In the absence of local government initiative reservoir owners may have a key role in maintaining the quality and public usefulness of reservoir shorelands. This report investigates reservoir owner policies which may be used to influence the location and character of shoreland development. Policies considered include land acquisition, residential, commercial, industrial, recreation, and forest land utilization, land management, and inter-agency cooperation. The experience of 25 Southeastern reservoir owners, including Corps of Engineers' districts, private power companies, and TVA, interviewed for this report indicates a wide variation in the current application of each of the above policies, but suggests that reservoir owners, in cooperation with local governmental units, can develop policy mixes adequate to protect reservoir shoreland environments.

THE ECONOMIC VALUE OF WATER IN INDUSTRIAL USES,
Rice (Cyrus Wm.) and Co., Pittsburgh, Pa.
Henry C. Bramer, and Donald J. Motz.
Available from the Clearinghouse as PB-189 248, $3.00 in paper copy, $0.65 in microfiche. A continuation of OWRR Contract 14-01-001-1581. (See Vol 2, No 9, Field 6C, entry W69-03322). Completion Report, Dec 1969. 192 p, 16 tab, 2 fig, 3 append. OWRR Project C-1511 (1990).

Descriptors: *Industrial water usage, *Industrial water costs, *Economic efficiency, Statistical model, Data acquisition form, Water resources utilization.
Identifiers: *Water utilization, Data acquisition, Mathematical model.

A study was made to acquire and evaluate data on the cost of industrial water utilization in the steel, paper, chemical, and petroleum industries in sufficient quantity to provide statistically reliable data on each industry as a whole. Data was collected with the industrial water use data form developed for this study. A statistical model was developed to supply a means by which industrial water utilization costs could be formulated by machine computation from the input data forms, used to construct models of industrial water utilization systems, and used to generate formatted data on industrial water utilization costs. The study was used to illustrate how data on industrial water costs can be used to promote more efficient water resource utilization by industry, government, and other water resource planners.

COST HANDBOOK FOR INDUSTRIAL WATER USES,
Rice (Cyrus Wm.) and Co., Pittsburgh, Pa.
Henry C. Bramer, and Donald J. Motz.
Available from the Clearinghouse as PB-189 253, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Dec 1969. 62 p, 16 tab, 2 fig, 1 append. OWRR Project X-105 (1997).

Descriptors: *Water use cost, *Cost per unit product, Steel, Paper, Chemical, Petroleum, Mathematical model, Data retrieval.
Identifiers: *Process water, *Water utilization cost, Heavy industry, Water quality, Waste treatment, Statistical analyses of data.

This handbook illustrates the application of the methods developed in the study entitled 'The Value of Water in Industrial Uses - A Continuation.' It presents general conclusions as to the nature of industrial water utilization and costs, illustrates the utility of the Industrial Water Use Data Form in formatting and retrieving data, illustrates the ability of the form in compiling data, and the use of the data generated in specific problem areas. General conclusions were: (1) The cost of industrial water utilization are best determined on the basis of cost per unit product, (2) Water utilization costs were not found to be definable functions of the age of the plant or level of technology, and (3) In general, industrial water utilization costs have not been shown to be predictably or functionally related to many water use parameters. More specific conclusions and examples are given for the industries. (Hutchins-NUS Corporation)

PAYMENTS TO STATE FOR WATERS DIVERTED.

NJ Stat Ann secs 58:2-1, 58:2-2, 58:2-4 (1966).

Descriptors: *New Jersey, *Diversion, *Water rates, *State governments, Legislation, Legal aspects, Diversion loss, Returns, Cities, Water supply, Streams, Rates, Administrative agencies.

Every municipality, corporation, or private person diverting the waters of streams or lakes with outlets for the purpose of a public water works shall make payments to the state for all such water diverted in excess of a total amount equal to 100 gallons daily for each inhabitant of the municipalities supplied, as shown by the census of 1905, or in excess of such amount as was legally diverted in 1907. The state Water Policy Commission shall provide maximum and minimum rates for water so diverted. Any water used for manufacturing and fire purposes only and returned without pollution to the stream from which it was taken shall not be included in the aggregate amount diverted. There is a state fee charged for water diverted from subsurface, well, or percolating water supplies acquired by condemnation by exercising the state's right of eminent domain. (Sisserson-Florida)

FISHING - UNLAWFUL METHODS.
Ind Ann Stat secs 11-1605 thru 11-1614 (1956), as amended, (Supp 1968).

Descriptors: *Indiana, *Fish, *Fishing, *Fishing gear, Legislation, Regulation, Administration, Sport fishing, Explosives, Electrical shocking gear, Fish toxins, Poisons, Nets, Seines, Trout, Minnows, Bass, Crayfish, Fish conservation, Fish management.
Identifiers: Penalties (Criminal).

It is unlawful to use seines, nets, traps, gaff hooks, snares, gigs, spears, electrical devices, explosives, fish toxins, or poisons for fishing. Penalties for violation of these provisions are set forth. Nets are permitted in Lake Michigan and the Wabash River boundary waters. Trot lines and similar devices are unlawful except at certain times and in certain geographical locations. The taking and transporting of minnows is regulated as are the permissible methods for the taking of trout, gar, dog fish, and carp. The sale of bass of specified varieties is prohibited unless such sale is for breeding or stocking purposes. The owners of the breeding and stocking ponds must obtain a permit from the Director of the Indiana Department of Conservation. (Moulder-Florida)

THE FEDERAL VIEW OF DAMAGES AND BENEFITS,
Department of Justice, Washington, D.C.
Clyde O. Martz.
Appraisal J, Vol 37, No 2, p 200-210, Apr 1969. 11 p, 29 ref.

Descriptors: *Damages, *Benefits, *Land appraisal, *Condemnation, *Property values, Right-of-way, Land tenure, Pricing, Value, Severance, Bibliographies, Land, Eminent domain, Condemnation value, Land ownership, Legal aspects.
Identifiers: *Land acquisition, Severance damages, Department of Justice.

When a Federal agency has difficulties in acquiring land for project use, the Department of Justice is requested to institute condemnation proceedings and conduct all negotiations and trial activities. Few cases ever come to trial; 75-80% are settled by judgment entered as a result of stipulations or failure of the landowner to appear. Federal law, not local state law, applies in Federal condemnation cases. One of the most misunderstood and unjustly criticized aspects of eminent domain is the allowance of benefits or value increase of remaining land to offset any compensation award for the land taken or for severance damage. Any enhancement in the value of property taken for a project cannot be considered in determining just compensation. Since benefits must be considered, the remainder is valued to the extent that the value is enhanced by the project. If the land taken is not considered enhanced by the project but the value of the aggregate is considered to be lessened by the taking, the landowner can be made whole by adding his compensation to the sum he might gain from the sale of the remainder in the market. Definitions and discussions are given regarding general, special, direct, and indirect benefits. (USBR)

PUBLIC RIGHTS TO USE AND HAVE ACCESS TO NAVIGABLE WATERS,
G. Graham Waite.
Wis L Rev, Vol 1958, No 3, p 335-375, May 1958. 41 p, 162 ref.

Descriptors: *Wisconsin, *Riparian rights, *Navigable waters, *Access routes, Legislation, State governments, Competing uses, Remedies, Ownership of beds, Obstruction to flow, Construction, Reasonable use, Recreation, Riparian land, Legal aspects, Boundaries (Property), Boundary disputes, Easements, Judicial decisions, Boating, Sport fishing, Swimming, Aesthetics, Economic impact, Hunting, Lakes.

Wisconsin is involved in determining through legislation, judicial decisions, and administrative regulation whether public or riparian owners shall have access to navigable waters. In analyzing the Wisconsin position, it is concluded that the public's right of access to navigable waters is restricted to those parts of the shoreline that can be reached without crossing private property. In reaching this result, possible alternatives and the policy reasoning behind the conclusion are examined. Priorities between recreational and commercial uses and between riparian and public rights are explored in gaining insight into the state's position. The theories of lake bed and stream bed ownership are considered as justifications of this position, as is the effect of the public right to navigation on navigable streams. The article concludes that for the public to best achieve access to navigable waters it must rely on legislation by local governments to open public roads to such waters. (Barnett-Florida)

MARITIME CONTIGUOUS ZONES,
Lloyd C. Fell.
Mich L Rev, Vol 62, No 5, p 848-864, Mar 1964. 17 p, 84 ref.

Descriptors: *Law of the sea, *International law, *Seas, *Oceans, Admiralty, Navigation, Legislation, Regulation, Littoral, United Nations, Fishing, Coasts, Jurisdiction.
Identifiers: Contiguous zones, Territorial waters.

This is a discussion of the problems involved when a coastal state asserts authority for special purposes over a zone of the sea outside its territorial waters. Early contiguous zones were acquiesced in when they appeared reasonable. The term contiguous zone is generally applied to those areas in which the littoral state exercises limited competence for special purposes, as distinguished from territorial waters over which it has sovereignty. There is no necessary relation between the width of the territorial sea and the establishment of the contiguous zone. A majority of states asserting contiguous zones have laws directed solely at enforcing the rights claimed therein. The problems of territorial seas and contiguous zones are being considered by the United Nations. The Geneva Conferences validated customs, fiscal, immigration, and sanitary zones up to twelve miles from shore which in effect limited the subjects amenable to contiguous zone treatment. (Moulder-Florida)

ARE WE LOSING OUR LAKES,
Roger A. Peterson.
S D L Rev, Vol 3, p 109-125, Spring 1958. 35 p, 89 ref.

Descriptors: *Reservation doctrine, *Ownership of beds, *Riparian rights, *Public rights, State governments, Accretion (Legal aspects), Lake beds, Lakes, Navigable waters, Riparian land, Federal government, Patents, Leases, Non-navigable waters, Minnesota, Illinois, Iowa, South Dakota, North Dakota, State jurisdiction, Federal jurisdiction, Legislation, Judicial decisions.

The article explores a limited cross-section of the divergent judicial decisions dealing with lake bed ownership disputes between the state and littoral owners and the retention of bed ownership by the state for public use. Two theories by which the state may acquire title to submerged beds are explored. The first theory gives the state title to all lakes and rivers which were navigable, according to the federal test of navigability, at the time the state was admitted to the Union. The second theory provides that a state may acquire title to lake beds if the federal government sold the property on which lakes were situated without indicating an intent to reserve or dispose of such property, regardless of the navigability of the lakes. After exploring the background of the federal navigability test, the judicial decisions of Minnesota, Iowa, Illinois, North Dakota, and South Dakota are examined with regard to their method of applying the two theories. It is concluded that Iowa, Illinois, and South Dakota adhere to the second theory, retaining greater ownership for public use. Unrestricted federal

patents vis-a-vis state jurisdiction are discussed. (Barnett-Florida)

ARE WE LOSING OUR LAKES (STATE'S ACQUISITION OF TITLE UPON ADMISSION TO THE UNION),
Roger A. Peterson.
S D L Rev Vol 3, p 109-113, Spring 1958. 5 p, 22 ref.

Descriptors: *Ownership of beds, *Lake beds, *Reservation doctrine, State governments, Public rights, Navigable waters, Federal government, Non-navigable waters, State jurisdiction, Federal jurisdiction, Boundaries (Property), Patents, Judicial decisions, Beds under water, Beds.

Following the American Revolution, each state held title to the beds of all navigable waters. Navigability was determined by the English test of whether the water was affected by the ebb and flow of the tide. Non-navigable beds were owned by the littoral or riparian owners. Each state subsequently admitted to the Union acquired title to navigable waters within its borders. Prior to admission, such waters were held by the federal government in trust for the new states. The English test of navigability was later discarded. For a state to claim title to waterways the test of navigability applied was whether the waters were, in fact, highways of commerce. The federal test differed from later developed state tests; the differences were resolved, however, in United States v Holt State Bank, 270 U S 49 (1926). Simply stated, the law is that each state, upon admission to the Union, acquired title to rivers and lakes if they were at that time navigable under the federal test. Other waters not navigable remain the property of the federal government. (Barnett-Florida)

ARE WE LOSING OUR LAKES. (STATE'S ACQUISITION OF TITLE THROUGH CONSTRUCTION OF FEDERAL PATENTS ACCORDING TO LOCAL LAW),
Roger A. Peterson.
S D L Rev Vol 3, p 113-118, Spring 1958. 6 p, 20 ref.

Descriptors: *Ownership of beds, *Reservation doctrine, *Riparian rights, Accretion (Legal aspects), Federal government, Patents, Non-navigable waters, Federal jurisdiction, Legislation, State jurisdiction, Public rights, Judicial decisions, Beds, Beds under water, Legal aspects.

Judicial decisions are used to show the precedent for applying local law rather than federal law in construing an unrestricted federal patent on non-navigable waters. It is made clear that if, under local law, title to a lake bed is not transferred under a private grant of the upland property, it is not transferred under an unrestricted federal patent. The question of who takes title to a lake bed that is surrounded by littoral owners who are claiming under unrestricted federal patents raises serious questions. An exploration of case law shows an expansion of sources from which restriction may be placed on any patent to avoid such conflicts. It has been concluded, however, that the definition of an unrestricted federal patent is purely a question of fact, dependent upon the intent of the federal government. Federal legislation requiring federal assent to the application of local law in construing its grants is a suggested reform. (Barnett-Florida)

ARE WE LOSING OUR LAKES. (HAVE THE STATES APPLIED BOTH THEORIES TO RETAIN CONTROL OF THE LAKES),
Roger A. Peterson.
S D L Rev, Vol 3, p 118-125, Spring 1958. 7 p, 30 ref.

Descriptors: *South Dakota, *Iowa, *Illinois, *North Dakota, Minnesota, Ownership of beds, Judicial decisions, Accretion (Legal aspects), State governments, Riparian rights, Lake beds, Lakes, Navigable waters, Riparian land, Federal government, Non-navigable waters, State jurisdiction, Public rights.

Two theories of lake bed ownership by the states have been applied. The first theory gives each state title to all navigable waters which were navigable under the federal test at the time of its admission to the Union. Under the second theory, the state may acquire title to lake beds, if the federal government transferred lake-front property without reservations, whether the lake is navigable or not. Minnesota applied a local test until 1957, when their state supreme court stated the rule that Minnesota could assert ownership over waters, as an incident of statehood, due to their navigability as determined by the federal navigability test. North Dakota followed the Minnesota test. In South Dakota, the Minnesota test was adopted, but pursuant to statute the state was deemed to own all waters which were navigable under the federal test. Iowa has avoided using the two theories explicitly, but implicit in its court decisions is the policy that the littoral owner does not acquire title to lake beds and that the state has sufficient interest to protect non-navigable lakes. Illinois has adopted the first theory by merely making a meander line conclusive evidence of navigability and thus vesting all ownership of navigable lake beds in the state. (Barnett-Florida)

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA,
Roger H. Doyle.
1963 Tulane Tidelands Inst, p 28-46, Claitor's Book Store, Baton Rouge, La. 18 p, 65 ref.

Descriptors: *Louisiana, *Beds, *Rivers, *Ownership of beds, Beds under water, Dry beds, Lake beds, River beds, Streambeds, Channel erosion, Navigable rivers, Banks, Bank erosion, Stream erosion, Mineral industry, State governments, Legislation, Shores, Estuaries.
Identifiers: Alienability of waterbottoms.

Inalienability is a characteristic of sovereign ownership of navigable waterbottoms. So long as the common or public uses are preserved, the beds and bottoms of navigable waters are susceptible of private ownership. The actual beds of navigable waters under Roman, Spanish, and common law were alienable when separable from the public use. Louisiana's constitutional prohibition against alienation of the beds of navigable waterways acknowledges their pre-existing susceptibility of private ownership. Adoption of the common law rule would have been more appropriate in a capitalistic society. Act 62 of 1912 cures defects in unauthorized transfers of waterbottoms. Subsequent cases conflict as the whether the beds of navigable waterways are susceptible to private ownership. California Co v Price, 225 La 706, 74 So 2d 1 (1954) cured the title to 4,000 acres of navigable waterbottom. The court in Miami Corp v State, 186 La 784, 173 So (1936) gave the state title to inundated lands on the basis of the insusceptibility of navigable waterbottoms to private ownership. State v Cenac, 341 La 1055, 132 So 2d 928 (1961) held that Price established the validity of private ownership and cast doubt on the validity of the Miami decision. (Dye-Florida)

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA (SOVEREIGN OWNERSHIP AND INALIENABILITY I),
Roger H. Doyle.
1963 Tulane Tidelands Inst, p 28-34, Claitor's Book Store, Baton Rouge , La. 7 p, 25 ref.

Descriptors: *Louisiana, *Beds, *Ownership of beds, *Legislation, Rivers, Beds under water, Dry beds, Lake beds, River beds, Streambeds, Navigable rivers, State governments, Riparian rights, Civil law, Legal aspects, Recreation, Relative rights, Public rights, Boundaries.
Identifiers: Alienability of waterbottoms.

Sovereign ownership of waterbottoms is divided into perfect proprietary ownership, dominum, and imperfect ownership, mere regulatory control, imperium. Roman, Spanish and the common law allowed alienation of the dominium, but not the imperium. If the two forms of ownership were inseparable, neither was alienable nor subject to private ownership. Imperium was exerted over the right of public use, as navigation or fishing, while dominium applied to separable physical bed. French law differed from the common law by making inalienable the thing to which the public use related in addition to the use itself. Louisiana Code articles classifying common things derives from Roman law. The article defining things public derives from French law. Thus, historical derivation is of no help in determining a Louisiana rule regarding private ownership of waterbottoms. Early Louisiana cases pronounced waterbottoms insusceptible of ownership subsequent to the first of the 'oyster acts' in 1886. These acts and the prohibition in the 1921 Louisiana Constitution against alienation to private ownership are implicit recognition of a prior susceptibility to such ownership. Adoption of the common law rule would have been more appropriate for a capitalist society. (Dye-Florida)

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA (SOVEREIGN OWNERSHIP AND INALIENABILITY II),
Roger H. Doyle.
1963 Tidelands Inst, p 34-38, Claitor's Book Store, Baton Rouge, La. 5 p, 19 ref.

Descriptors: *Louisiana, *Beds, *Ownership of beds, *Legislation, Rivers, Beds under water, Dry beds, Lake beds, River beds, Streambeds, Navigable rivers, State governments, Riparian rights, Legal aspects, Relative rights, Public rights.

In 1908, the Louisiana Supreme Court held that the 1886 'oyster statute' constituted legislative ratification of pre-existing private title to an arm of the sea. The unauthorized alienation of the bottom was found to have been cured by laches on the part of the state. This estoppel by laches was codified by Act 62 of 1912, curing unauthorized or void transfers from the state or its agencies. Courts have not required transfers to be express to benefit from Act 62. Titles to waterbottoms included in a transferred area are also cured. Humble Oil v State Mineral Bd, 223 La 47, 64 So 2d 839 (1953) applied the Act to effect the transfer of the bottom of a navigable waterway by a state agency totally without title. California Co v Price applied the Act to an arm of the sea. Miami Corp. v State, however, gave the state title to inundated land because waterbottoms are insusceptible of private ownership under the codal articles. (Dye-Florida)
W70-03388

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA (CHANGING SHORELINES),
Roger H. Doyle.
1963 Tulane Tidelands Inst, p 38-46, Claitor's Book Store, Baton Rouge, La. 9 p, 20 ref.

Descriptors: *Louisiana, *Beds, *Ownership of beds, *Lake beds, Lakes, Rivers, Beds under water, Dry beds, River beds, Streambeds, Channel erosion, Banks, Bank erosion, Stream erosion, State governments, Legislation, Shores, Legal aspects, Boundaries (Property), Accretion (Legal aspects), Alluvion, Reliction, Riparian rights.

Miami Corp v State involved title to the bed of a changing body of water. Early cases held that neither accretion of the shores of a lake, nor lands left dry by receding waters accrue to the riparian owner. Conversely, in Miami, the court held that the state acquired title to areas inundated subsequent to the issuance of a patent because the bed was not susceptible to private ownership. On this point, the later California Co v Price case held otherwise. Statutes limit application of the Miami doctrine to true quiescent lakes. Factual distinctions between Miami and Price raise doubts that Miami was overruled. Price did not involve erosion or inundation and applied only to post-patent inundation. State v Cenac involved inundation of patented and unpatented beds, and thus involved the facts of both Price and Miami, and thereby offered an opportunity to reconcile the two doctrines. The state waived this opportunity by insisting that Price be overruled and that post-patent as well as pre-patent inundations cause reversion of beds to the state. The court upheld the Price doctrine and applied it to the entire inundated property, casting the Miami doctrine into even greater doubt. (Dye-Florida)
W70-03389

CONSERVATION OF NATURAL RESOURCES (FISHING).
Ohio Rev Code Ann secs 1533.32 thru 1533.66 (Page 1964), as amended, (Supp 1970).

Descriptors: *Fishing, *Nets, *Ohio, *Recreation, Water utilization, Commercial fishing, Bait fishing, Sport fishing, Electrical shocking gear, Fish hatcheries, Fish management, Baits, Fyke nets, Gill nets, Fishing gear, Marking techniques, Legislation, Local governments, Electro-fishing, Permits, Fish passages, Fish, Public health.
Identifiers: Trap nets, Crib nets.

The Attorney General, the Chief of the Division of Wildlife, and the Director of Natural Resources may enter reciprocal agreements with the proper authorities of other states to regulate the catching of fish. Except for certain circumstances listed, the use of a boat, net, or device for fishing requires a license. Fish shall be taken only by angling, unless otherwise provided by the Revised Code. Requirements for the issuance of permits for private fish hatchery ponds and minnow sales are prescribed. The fishing season for Lake Erie and other waters is established. Commercial fishermen are required to record their daily catch. Fishing devices used in the Lake Erie fishing district are regulated. Specific provisions cover the depth, width, length, and mesh size of several types of nets which may be used in fishing. Unauthorized netting locations, Lake Erie netting season dates, and net inspection methods are described. The use of quicklime, electricity, or any other deleterious substances in Ohio waters is proscribed. Any obstruction to the natural transit of fish is prohibited. Requirements as to length, weight, and methods of taking specific species of fish are designated. Fish lawfully confined by a net or device are property of the owner or person operating such net or device. Each fish illegally taken constitutes a separate offense. (Powell-Florida)

WATERCRAFT; NAVIGATION.

Ohio Rev Code Ann secs 1547.01 thru 1547.78 (Page 1964), as amended, (Supp 1970).

Descriptors: *Ohio, *Waste disposal, *Boating regulations, *Navigation, Boats, Ships, Water skiing, Harbors, Water policy, Water resources development, Recreation, Water law, Water conservation, Legislation, Environmental sanitation, Recreation wastes, Domestic wastes, Construction, Maintenance, Projects, Bank erosion, Shores, Administrative agencies.
Identifiers: *Refuge harbors

Waters of the state and navigable waters are defined. Specifications for watercraft lights and operating regulations for preventing collisions between watercraft are enumerated. Various other regulations pertaining to the operation of watercraft are provided. Water skiing activities and watercraft safety measures are prescribed. Except on designated waters, no person shall operate or use any watercraft containing a sink, toilet, or sanitary system capable of discharging wastes. The Division of Watercraft is created to administer the identification and numbering of watercraft operated on Ohio waters. The Division of Watercraft acts as the refuge and small boat harbor agency for the purpose of working with the Corps of Engineers. The Watercraft Division may construct and maintain refuge harbors and other projects related to light draft vessels and marine recreational facilities. A Waterways Safety Council advises the Watercraft Division Chief as to construction and maintenance of refuge harbor projects and methods of coordinating shore erosion projects with refuge harbor projects. Penalties for violations of various sections of the watercraft laws are enumerated. (Powell-Florida)

BRIDGE COMPANIES.

Ohio Rev Code Ann secs 1741.01-1741.14 (Page 1964).

Descriptors: *Ohio, *Bridge construction, *Bridges, *Ohio River, Railroads, Abutments, Regulation, Permits, State governments, Legislation, Rates, Interstate rivers, Construction, Legal aspects, Financing, Standards, Interstate.
Identifiers: *Tolls, *Bridge companies, Toll rates.

A bridge company must lawfully possess a right in the banks of those streams it intends to build its bridges over. Toll rates for intrastate bridges are stipulated. A bridge built across the Ohio River must conform to congressional standards. The maximum and minimum height of bridges built across the Ohio River is stipulated. Reasonable toll rates may be set by the bridge company, but may never exceed those collected at the Covington-Cincinnati Bridge. Upon payment of a stipulated rate of toll, railroad companies may use such bridges built across the Ohio River. Two bridge companies, from different states, may form one consolidated domestic corporation, subject to the regulations of this state, to build a bridge across the Ohio River. The bridge companies may operate ferries as well as make and enforce all rules necessary to protect their property. (Barnett-Florida)
W70-03409

STATE'S POWER OVER WATERS OF LAKE ERIE AND OVER LEASING OF LAKEFRONT LAND FOR PRIVATE IMPROVEMENT.

Ohio Rev Code Ann secs 123.03, 123.031 (Page 1969), as amended, (Supp 1970).

Descriptors: *Ohio, *Lake Erie, *Riparian land, *Leases, Water rights, Navigation, Land tenure, Shores, Soil management, Littoral, Riparian rights, Channels, Reasonable use, Piers, Landfills, Legislation, Public rights, Administrative agencies, Administrative decisions, Aquatic soils, Local governments, Port authorities, Planning, Programs, Mineralogy, Fisheries.

The water and underlying bed of Lake Erie within the jurisdiction of the state are owned and held by the state for public use, subject to the powers of the United States, rights of public navigation, commerce, and fishery and property rights of littoral owners. The Department of Public Works is responsible for care, protection, and enforcement of the state's interests in this territory. Any owner of uplands fronting on Lake Erie may apply to the state for a lease of the waters and underlying beds or artificially filled lands between the natural shore line and the harbor line, for specified purposes. The Director of Public Works shall determine whether the suggested improvements and developments will impair public rights. The appropriate municipal corporation, county commission, or port authority shall determine whether the territory is needed by that local authority, and whether the proposed use complies with the authority's waterfront plans. The Director shall establish the consideration for and period of such lease. The Governor shall issue the lease certificate, specifically reserving to the state all mineral rights in the leased territory. (Dearing-Florida)
W70-03410

COMPACT CONCERNING PYMATUNING LAKE.
Ohio Rev Code Ann sec 1541.31 (Page 1964).

Descriptors: *Ohio, *Interstate compacts, *Recreation, *Multiple-purpose reservoirs, Multiple-purpose projects, Legislation, Legal aspects, Boats, Safety, Water conservation, Flood control, Pennsylvania, Dams, Swamps, Water pollution, Reservoirs, Jurisdiction, Fishing, Boating.
Identifiers: *Pymatuning Lake.

Ohio hereby enters into a compact with Pennsylvania concerning Pymatuning Lake. Ohio's Conservation Commissioner is authorized to carry out Ohio's duties under the compact. Pennsylvania's agent for purposes of the compact will be its Water and Power Resources Board. The primary purposes of the project, by which the Lake is created, are water conservation, flood control, and regulation of flow in the Shenango and Beaver rivers. The secondary purposes are to permit fishing, hunting, and recreation in such ways as will not interfere with the primary purposes. The Lake will be open to citizens of both states for fishing, hunting, boating, and recreational purposes. Both states will protect the Lake against pollution from all sources. The only restriction on boating is that no motor will be used in excess of ten horsepower. Pennsylvania reserves the unrestricted right to regulate the level of the Lake in furtherance of a primary purpose of the project: regulation of flow in the Schnango and Beaver rivers. (Keith-Florida)
W70-03411

BOOM COMPANIES.

Tenn Code Ann secs 68-201 thru 68-204 (1956).

Descriptors: *Tennessee, *Lumbering, *Streams, *Navigation, Rivers, Inland waterways, River basins, Lumber, Boats, Regulation, Economics, Legislation, Damages, Riparian rights, Legal aspects, Aquatic drift.
Identifiers: Booms, Boom companies, Obstruction to navigation.

Boom companies may float wood, lumber, and logs down any stream or its tributaries, and may construct booms for the purpose of catching and securing their logs, wood, and lumber. Such booms shall not prevent the safe and convenient passage of rafts, logs, and boats on any river. A boom corporation may enter upon the lands of others for the purpose of reclaiming and securing its logs, lumber and rafts. The corporation shall pay any damages caused by the entry, and the logs, lumber or rafts shall be removed within a reasonable time. All logs, lumber or rafts belonging to other parties which may float onto a boom shall be returned to the owners upon proof of ownership. (Smith-Florida)
W70-03412

LANDING AND LOADING FACILITIES.

Tenn Code Ann secs 70-201 thru 70-209 (1956).

Descriptors: *Tennessee, *Transportation, *Navigable waters, *Administrative agencies, Boats, Navigable rivers, Rivers, Streams, Navigation, Communication, Highways, Administration, Inland waterways, River basin development,

Docks, Regulation, Economics, Public benefits, Legislation, Building codes, Access routes.
Identifiers: Landing, Loading, Commerce.

The Commissioner of the Department of Highways and Public Works is authorized to acquire, maintain, and operate any public facilities he may deem suitable for loading and landing cargo wherever state highways intersect or parallel any navigable waters in the state. The Commissioner may perform any acts and make any regulations to carry out the purpose of this act, and is authorized to cooperate with subdivisions and agencies of the state or federal government. The purpose of this chapter is to promote traffic and commerce upon the waters of the state and to aid the United States in improving navigation. Due regard shall be had for the paramount rights of the United States in navigable waters. No owner or operator of any river wharf shall collect any charge for wharfage or landing of boats unless the wharf is in good repair. Failure to keep a wharf in good repair is a misdemeanor. (Smith-Florida)
W70-03414

APPEALS IN DRAINAGE AND LEVEE DISTRICT PROCEEDINGS.

Tenn Code Ann secs 70-1101 thru 70-1109 (1956).

Descriptors: *Tennessee, *Drainage districts, *Judicial decisions, *Adjudication procedure, Legal aspects, Legislation, Levees, Condemnation, Damages, Costs, Jurisdiction, Flood control, Structures, Water law.
Identifiers: Appeal procedure.

Any party aggrieved by a decision of the county court in establishing or refusing to establish a drainage or levee district may appeal to the circuit court. An appeal from a judgment of the county court will not prevent further improvement, appropriation, and condemnation if the district posts a security bond payable to the appellant for double the amount of damages claimed. The circuit court shall hear any such appeal de novo. Any new finding of damages in the circuit court shall be entered in the records of the county court. (Schram-Florida)
W70-03417

WATERS, DRAINS AND LEVEES (BOND ISSUES AND WARRANTS).

Tenn Code Ann secs 70-1401 thru 70-1432 (1956).

Descriptors: *Tennessee, *Government finance, *Administrative agencies, *Drainage districts, Local governments, Loans, Interest, Assessments, Taxes, Legal aspects, Legislation, Land tenure, Judicial decisions, Economics, Administration, Maintenance, Maintenance costs, Jurisdiction, Levees, Land reclamation.
Identifiers: *Bonds.

County courts may authorize the issuance of drainage bonds to fund the reclamation or improvement of drainage areas. The terms of the bonds are to be fixed by the board of directors of the improvement district. The bonds are to be paid by assessments on lands within the district. Bonds for multi-county districts must be approved by each county. Individuals may pay their assessments by tendering bonds to the board of directors. Maintenance and/or administration certificates issued on the bonds or receipts held in that fund will constitute a lein on the land in the district until the assessment is paid. Refunding bonds may also be issued to refund existing bonded indebtedness. Taxes resulting from bonding assessments shall be collected and enforced in the same manner as drainage taxes. The directors of a bonding district may also borrow money to make up deficiencies in collections needed to pay off bonds and interest. Upon default on any bond, a receiver may be appointed to collect the assessments due to the defaulting district. (Dearing-Florida)
W70-03418

BOATING SAFETY ACT OF 1965.

Tenn Code Ann secs 70-2201 thru 70-2225 (Supp 1969).

Descriptors: *Tennessee, *Boating regulations, *Administrative agencies, *Safety, Recreation, Boats, Accidents, Public health, Equipment, Operation and maintenance, Coordination, State governments, Government finance, Education, Administration, Local governments, Coast guard regulations, Skiing, Buoys, Navigation, Inspection, Jurisdiction, Legal aspects, Judicial decisions, Water sports.
Identifiers: Boat registration.

The Tennessee Game and Fish Commission shall enforce this act, the purpose of which is to promote the safety of persons and property in and connected with vessels. The Commission shall establish programs for: (1) public education in boating safety; (2) registration and regulation of vessels; (3) cooperation with other state and federal agencies; and (4) improvement and promotion of the waters for recreational purposes. Vessels other than those specifically exempted must be numbered for identification by the Commission. A Boating Safety Advisory Board is created to advise the Commission on rules and regulations for boating safety. The Commission shall establish rules and regulations governing safety equipment and operation of vessels. The Commission may authorize special aquatic events. Damaging vessels, interfering with navigation aids, and the use of sirens are prohibited. The Commission may license and inspect vessels carrying passengers for hire. Owners are liable for the damage caused by their vessels. (Dearing-Florida)
W70-03423

DRIFTING AND FLOATING TIMBER.

Tenn Code Ann secs 68-102, 68-103 (1956).

Descriptors: *Tennessee, *Lumber, *Aquatic drift, *Compensation, Driftwood, Streams, Rivers, Navigable waters, Boats, Damages, Legislation, Legal aspects.

Timber, whether branded or not, found adrift or floating in any stream or water of this state and which has been prepared for sale without a boom or other arrangement by the owner for the preservation thereof entitles the finder to receive compensation from the owner for as much as he delivers to the owner. The amounts of such compensation are set forth. Any person who takes up and cares for any fleet, raft, or platform of timber shall be entitled to additional compensation. (Smith-Florida)
W70-03426

TELEGRAPH AND TELEPHONES.
Tenn Code Ann secs 65-2101, 65-2105, 65-2106 (1956).

Descriptors: *Tennessee, *Communication, *Navigation, *Transmission, Legislation, Transmission lines, Rivers, Surface waters, Construction, Maintenance, Operation and maintenance, Navigable waters.

Telegraph and telephone corporations can construct telegraph or telephone lines and erect necessary fixtures across, over, or under Tennessee rivers provided the navigation of said waters is not impeded. Any person or corporation organized for the purpose of transmitting intelligence may construct, operate and maintain necessary telegraph, telephone or other lines across and under Tennessee waters. (Powell-Florida)

DUVAL ENGINEERING AND CONTRACTING CO V SALES (RIPARIAN RIGHTS).
77 So2d 431-434 (Fla 1954).

Descriptors: *Florida, *Riparian rights, *Eminent domain, Judicial decisions, State jurisdiction, Ownership of beds, Prescriptive rights, Remedies, Riparian land, Banks, Condemnation, Right-of-way, Beds.

Upland owners sued to enjoin agents of the state from constructing a bridge across a navigable river. Plaintiffs alleged that such construction was either an appropriation of riparian rights or a taking of property which necessitated proceedings in eminent domain. Plaintiffs won on the alternative eminent domain pleading. The state appealed. The supreme court stated that since plaintiff failed to fill in or permanently improve the submerged land continuously from the high water mark in the direction of the channel, the land was therefore subject to reversion and subsequent sale under a statute vesting title in State Road Department. Duval Engineering was therefore lawfully exercising governmental power and respondent was without right to compensation for impairment of riparian rights. (Moulder-Florida)

WHARVES, DOCKS AND FERRIES.
Pa Stat Ann tit 53, secs 14191, 14193, 14197 (1957).

Descriptors: *Pennsylvania, *Docks, *Piers, *Coastal structures, Bulkheads, Low water mark, High water mark, Legislation, Riparian rights, Easements, Construction, Navigable waters, Administrative agencies, Administrative decisions, Local governments, Marshes, Coastal marshes, Land reclamation, Boats, Navigation, Storage, Basins.

The Director of the Department of Wharves, Docks, and Ferries shall have the power to regulate, fix and establish bulkhead and pierhead lines, and the distance between piers. He may also adopt regulations for the construction, extension, improvement, and repair of wharves, piers, bulkheads, docks, slips and basins. The Director shall have charge of all the wharf storage property belonging to cities of the first class, including all easements, uses, reversions, and rights belonging thereto. The Director shall have authority to purchase, in the name of these cities, such unimproved marshlands as may be reclaimable between the low-water line and the high-water shore-line of the navigable waters. After appropriation of money by the city, the Director may reclaim, fill-in and improve the marsh-lands and construct thereon wharves, piers, docks, slips, basins, and storage facilities. Any land that cannot be improved may be leased or sold. The Director may purchase any coastal structures that are necessary for the purposes of commerce and navigation. He may also purchase, maintain, and operate any boats, launches, ice boats and dredges necessary for the performance of the duties of the Department of Wharves, Docks and Ferries. (Schram-Florida)

TURNPIKE BRIDGE ACROSS THE DELAWARE RIVER.
Pa Stat Ann tit 36, sec 658.2 (1961).

Descriptors: *Pennsylvania, *Bridges, *Highways, Interstate rivers, Interstate compacts, Water resources development, State governments, Water policy, Road construction, Transportation, Bridge construction, Administrative agencies, Administration, New Jersey, Delaware River.

In order to facilitate traffic across the Commonwealth, the Pennsylvania Turnpike Commission is

empowered to construct a turnpike from the eastern extension of the turnpike system to a point on or near the Delaware River between Pennsylvania and New Jersey. At that point, the Commission is to construct, operate and maintain a bridge, either alone or in conjunction with the New Jersey Turnpike Authority. The Commission may acquire the use, operation or maintenance of any bridge across the Delaware River heretofore or hereafter constructed, together with connecting roads, tunnels and bridges. (Smith-Florida)
W70-03571

DELAWARE RIVER PORT AUTHORITY (JOINT COMPACT WITH NEW JERSEY).
Pa Stat Ann tit 36, secs 3503, 3504 (1961), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Port authorities, *Delaware River, *Interstate compacts, Interstate commissions, Interstate rivers, River basin commissions, Water resources development, State governments, Rivers, Bridges, Bridge construction, Communication, Navigation, Transportation, Eminent domain, Condemnation, Regulation, Cities, Highways, River basin development, Legislation.

Whereas New Jersey and Pennsylvania have a common interest in the development of the Delaware River from Philadelphia and Camden to the sea, and in the operation and regulation of bridges and other forms of communication and trade routes, the Delaware River Joint Commission is continued as the Delaware River Port Authority to effectuate its enumerated purposes. The composition of the Commission is described and its general powers are listed. A limited power of eminent domain is granted, and financial powers and liabilities are described. Various limitations are imposed on the Commission's powers. Rules and regulations are provided for, and policemen for the enforcement thereof may be appointed. (Smith-Florida)
W70-03572

DELAWARE RIVER PORT AUTHORITY (PURPOSES).
Pa Stat Ann tit 36, sec 3503 (1961), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Interstate commissions, *Delaware River, *Interstate compacts, Interstate rivers, River basin commissions, Water resources development, Rivers, Bridges, Bridge construction, Transportation, Communication, Tunnels, Tunnel construction, Harbors, Eminent domain, Condemnation, Regulation, Cities, Highways, River basin development, Port authorities.

The Delaware River Port Authority is (1) to operate, maintain and improve the bridge between Camden and Philadelphia; (2) to establish and operate facilities for passenger transportation across bridges or tunnels controlled by the Commission; (3) to improve the Port District for port purposes; (4) to cooperate with other bodies interested in the Delaware River and Port District; (5) to construct bridges and tunnels across or under the Delaware River; (6) to promote the Delaware River as a highway of commerce; and (7) to make studies and recommendations for the improvement of commerce facilities on the Delaware River. For its authorized purposes the Commission is empowered to: (1) have legal existence with all the rights and liabilities thereto; (2) exercise eminent domain in the Port District; (3) determine the location and character of all improvements or facilities within its jurisdiction; and (4) acquire and operate any project or facility of commerce. DELAWARE RIVER PORT AUTHORITY (REVENUE).
Pa Stat Ann tit 36, secs 3503, 3504 (1961), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Interstate commissions, *Delaware River, *Interstate compacts, Interstate rivers, River basin commissions, River basin development, Water resources development, Rivers, Bridges, Bridge construction, Communication, Navigation, Transportation, Eminent domain, Regulation, Cities, Tunnels, Tunnel construction, Legislation.

The control, operation and collection of tolls and other revenue of the existing bridge across the Delaware River belong to the Commission, but the Commission is liable to Pennsylvania, New Jersey and Philadelphia for certain named moneys. The Commission is authorized to make and enforce such rules and regulations and to collect such tolls and other charges in connection with properties it controls as it may deem necessary or proper. The Commission shall make annual reports to the member states. The Commission upon written consent of the Governors, is empowered to acquire the Tacony-Palmyra Bridge with any approaches thereto. The Commission shall not erect any new facility without prior approval of the Governors of both states. Certain local limitations on bridge and tunnel construction are imposed. The Commission is empowered to construct and operate a bridge or tunnel for vehicular traffic at named locations and to exercise eminent domain to obtain private or public property for such projects. The Commission is empowered to construct, rehabilitate and operate ferries across the Delaware River within the Port District. Public utilities' rights of way shall be relocated if condemned by the Commission. (Smith-Florida)

REMOVAL OF MILLDAMS.
Ohio Rev Code Ann secs 6155.01 thru 6155.13 (Page 1953).

Descriptors: *Ohio, *Milldams, *Administrative agencies, Assessments, Streams, Water supply, Benefits, Costs, Legal aspects, Public health, Damages, Land tenure, Cost allocation, Local governments, Structures.
Identifiers: *Passage of water, Removal.

Procedures required for the removal of milldams are described. Two-thirds of the affected landowners must file a petition with the county auditor and a surety bond to pay expenses if the county board of commissioners refuses the petition. Notice of hearings is required. The board of commissioners shall view the premises and shall determine if the improvement and removal of the milldam is conducive to public health, convenience, or welfare. If it grants the petition, the board shall negotiate for the purchase of the milldam. The board shall equitably apportion the costs of purchase and removal to each of the petitioners and landowners benefited by the removal. Upon failure to agree with an owner of a milldam, application for damages may be made. Real estate of the benefited landowners shall be assessed to pay the costs of removal. (Duss-Florida)
W70-03576

MUNICIPAL CORPORATIONS (PUBLIC SERVICES).

Ohio Rev Code Ann secs 735.02, 735.32 (Page 1953).

Descriptors: *Ohio, *Cities, *Public utilities, *Maintenance, Legislation, Local governments, Projects, City planning, Administration, Utilities, Roads, Engineering personnel, Repairing, Mechanical engineering, Sewers, Drains, Ditches, Streams, Sewage, Construction, Administrative agencies, Legal aspects, Water management (Applied), Channels, Water courses (Legal).

The director of public service manages and supervises all public works of the city. The director supervises the improvement and repair of wharves, docks, landings, bridges, aqueducts, sewers, drains, ditches, culverts, ship channels, streams, and watercourses. The director manages municipal water undertakings of the city and sewage disposal plants. The street commissioner, or an engineer if provided, supervises the improvement of streets and other enumerated activities. (Powell-Florida)

PUBLIC UTILITIES AND CARRIERS.
Tenn Code Ann secs 65-2201 thru 65-2204 (1956).

Descriptors: *Tennessee, *Public utilities, *Dams, *Navigable waters, Legislation, Construction, Eminent domain, Streams, Rivers, Water consumption, Industrial water, Domestic water, Water control, Hydroelectric plants, Water works, Water conveyance, Electric power production, Navigation, Boats, Canals, Reservoirs, Ponds, Locks, Sluices, Diversion, Legal aspects.
Identifiers: *Sluiceway.

Gas and electric corporations furnishing light, heat, and power generated or produced from stream power or water power obtained by a dam across any stream of water have the power of eminent domain. They may use, employ, and divert necessary water flowing in and running into a stream or watercourse. They may also use lands necessary in establishing and maintaining their power houses, canals, flumes, conduits, pipelines, reservoirs, ponds, and dams. A sluiceway, lock or other fixture sufficient to permit logs, timber, lumber, and boats to pass around, through or over a dam must be maintained in connection with the corporation's dam in navigable waters. Plans and details for work on dams in navigable waters must be submitted to the Secretary of the Army for his approval before work is commenced. Construction in navigable waters is subject to the supervision and approval of the Engineer Officer of the United States Army in charge of the locality. (Powell-Florida)
W70-03586

WATER AND WATERWORKS COMPANIES.

Tenn Code Ann secs 65-2701 thru 65-2704, 65-2709 (1956).

Descriptors: *Tennessee, *Public utilities, *Condemnation, *Water polution, Eminent domain, Legal aspects, Legislation, Cost repayment, Right-of-way, Condemnation value, Water control, Water conveyance, Watercourses (Legal), Streams, Riparian rights, Domestic water, Municipal water, Riparian land, Riparian waters, Canals, Conduits, Ponds, Dams, Reservoirs, Water consumption (Excludes consumptive use), Water allocation (Policy), Water distribution (Applied), Environmental sanitation.

Any water company is empowered to acquire, by purchase, condemnation, or other proper method, the right to use and divert the necessary water flowing and running into any stream or watercourse. The water company may also take land, water, riparian rights and rights-of-way necessary for establishing and maintaining its power houses, canals, flumes, conduits, pipelines, ponds, dams, reservoirs, and other works. Water companies, incorporated under Tennessee laws and having contracts to supply water to public charitable institutions may condemn springs, creeks, waters and riparian rights for the purpose of furnishing such water supply. The water company must compensate the owners for property condemned and may give a bond pending assessment of damages resulting from condemnation of water or rights. It is unlawful to corrupt any stream or reservoir used by a corporation for water supply. (Powell-Florida)

DIVISION OF WILDLIFE.
Ohio Rev Code Ann secs 1531.06, 1531.07, 1531.11, 1531.14, 1531.15, 1531.24 (Page 1964), as amended, (Supp 1970), sec 1531.29 (Page Supp 1970).

Descriptors: *Ohio, *Natural resources, *Wildlife management, *Wildlife conservation, Legislation, Legal aspects, Water rights, Water conservation, Wastes, Water pollution control, Fish hatcheries, Regulation, Recreation, Fishing, Streams, Lakes, Reservoirs, Clams, Mussels, Crayfish, Fish, Frogs, Turtles, Investigations, Ponds, Rivers, United States, Wildlife, Water resources development, Fish stocking.

The Chief of the Division of Wildlife may acquire lands or surface rights upon lands or waters for wildlife management, preservation and propagation, and for outdoor activities such as hunting and fishing. The Chief is empowered to make regulations to protect these acquisitions from pollution and waste and to provide for the taking of wildlife on the acquired property. All lakes, reservoirs, and state lands dedicated to public recreational use will be placed under the supervision and control of the Chief. No person may take, possess, buy, or sell any clams, mussels, crayfish, fish, or frogs contrary to a Division regulation. Employees of the Division may enter upon private land to conduct fish or game research, fish restoration, or fish restocking. The Division may take fish at any time or place and in any manner stock hatcheries, ponds, lakes, or rivers, or exterminate rough fish. The Division may set aside any waters for the propagation of fish. The United States Commissioner of Fisheries may operate and maintain fish hatcheries within the state. He may conduct investigations and fish cultural operations. No person may discharge garbage, rubbish, or other unsightly or unsanitary wastes into any state owned or controlled watercourse. This section does not apply either to discharge of wastes under authority of a valid permit, or to pollution of waters which do not join natural surface or underground waters. (Keith-Florida)
W70-03588

BRIDGE COMPANIES (CONSTRUCTION OF BRIDGES AND INTERFERENCE WITH NAVIGATION).
Tenn Code Ann sec 54-1803 (1968).

Descriptors: *Tennessee, *Bridges, *Bridge design, *Navigation, Design standards, Navigable waters, Streams, Boats, Structures, Construction, Legislation, Bridge construction, Standards.
Identifiers: Obstruction to navigation.

Bridge companies may adopt design standards and specifications to insure that bridges shall be safely built and suitable for the intended traffic. Bridges across navigable streams shall not necessarily interfere with navigation, and shall have enough draw or be sufficiently high to allow the passage of boats under them. (Duss-Florida)
W70-03589

GAME AND FISH COMMISSION (GAME AND FISH MANAGEMENT AND CONSERVATION).

Tenn Code Ann secs 51-101 thru 51-121 (1966).

Descriptors: *Tennessee, *Administrative agencies, *Fish, *Fish management, Fish conservation, Fish hatcheries, Commercial fishing, Fish stocking, Bodies of water, Ponds, Fishing, Fisheries, Regulation, Legislation, Financing, Wildlife conservation, Wildlife management, Game birds, Fur-bearing animals, Hunting, Conservation, Wildlife.
Identifiers: *Fish propagation, *Preserves, Reservations, Nursery ponds, Penalties (Criminal).

The State Game and Fish Commission is herein created. The operation of the Commission is provided. The Governor shall appoint Commissioners. The Commission has full and exclusive jurisdiction of the duties and functions relating to fish, game, and wildlife. It is the Commission's duty to protect, propagate and preserve game, fish, fur-bearing animals and wildlife of the state. The Commission is authorized to acquire lands and waters suitable for; fish hatcheries, nursery ponds, or game farms; animal restoration, propagation, protection or management; and public hunting, fishing, or trapping areas. The Commission may acquire species of animals for these purposes and control undesirable species. It may enter into cooperative agreements with landowners to further wildlife management. It may enter into agreements with educational institutions and other governmental agencies to promote wildlife management and conservation. Procedures are outlined for the appointment and compensation of a Director for the Commission and of personnel needed for the administration of game and fish laws. The powers and duties of these officers are described. Financing of the various activities of the Commission and its personnel is described. (Duss-Florida)

HEALTH AND SAFETY (MALARIA).

Tenn Code Ann secs 53-801 thru 53-809 (1966).

Descriptors: *Tennessee, *Impounded waters, *Mosquitoes, *Public health, Permits, Impoundments, State governments, Legislation, Administration, Administrative agencies, Regulation, Diseases, Bayous, Afterbays, Obstruction to flow, Aedes species.
Identifiers: Nuisances.

Impounded water is defined as a body of water of less than one acre which has collected under other than natural conditions. Any person proposing to impound water must obtain a permit for impoundage construction from the Commissioner of the State Department of Public Health. Application is to be made upon a special form, accompanied with a description of the project, its purpose, location and a plat of the general area. Application to permit actual impoundage of water must be made to the Commissioner after construction is complete. The Commissioner shall make rules and regulations regarding impounded water to be carried out by those responsible for the impounded area. The Commissioner must inspect impounded waters to see if such is conducive to the breeding of malaria or other disease-carrying mosquitoes. If conducive to such breeding, the condition must be corrected by the one responsible for the impoundage area. Failure to do so is a misdemeanor and punishable by fine. If convicted three times for violation of this act, the impounded area may be abated as a nuisance at the cost of the owner. (Barnett-Florida)

CONCURRENT JURISDICTION OF THE MISSISSIPPI RIVER.
Tenn Code Ann secs 4-102, 4-103 (1956).

Descriptors: *Tennessee, *Boundaries (Property), *Jurisdiction, *Mississippi River, Legislation, Missouri, Arkansas, Legal aspects, Rivers, State jurisdiction, Meanders, Banks, Boundary disputes, Supervisory control (Power), Water rights, Political aspects.
Identifiers: Concurrent jurisdiction.

Tennessee has concurrent jurisdiction over the waters of any river which forms a common boundary with another state. The criminal jurisdiction of the state of Tennessee is extended to the west bank of the Mississippi River and extends across the Mississippi River where it flows parallel to the boundary of Tennessee. Thus, the states of Tennessee, Arkansas, and Missouri have concurrent criminal jurisdiction over those parts of the Mississippi River which lie opposite them. This section shall become effective as to the states of Arkansas and Missouri when these states pass similar legislation. (Schram-Florida)

BRIDGES (CONSTRUCTION OF BRIDGES BY COUNTY COURTS).
Mo Ann Stat secs 234.010 thru 234.090 (1952).

Descriptors: *Missouri, *Bridges, *Bridge construction, Local governments, Culverts, Concrete construction, Repairing, Maintenance, Supervisory control (Power), Administrative agencies, Legislation, Damages, Compensation, Financing, Costs, Participating funds, Bridge failure, Taxes, Assessments, Construction costs, Rivers, Streams, Highways.

Each county court shall determine whether the county court or road districts shall build and maintain bridges. The construction of all masonry or concrete culverts and bridges and all bridges costing more than fifty dollars shall be under the supervision of the county highway engineer. Whenever a county bridge is badly damaged by floods or becomes dangerous to public travel, the county highway engineer, with the consent of one or more county judges, may contract to have the bridge repaired. The county court shall allow a reasonable compensation for such repairs. The control and management of toll bridges and roads constructed by now defunct corporations shall be vested in the local county court. Taxpayers may petition for the construction of bridges in any township. County courts may unite for the purpose of building bridges beneficial to the adjoining counties. The procedure for building bridges uniting counties is provided. The procedures for constructing and financing bridges between Missouri and adjoining states are detailed. (Schram-Florida)

A UNITED STATES POLICY FOR THE WET FRONTIER,
Theodore F. Stevens.
Nat Res Lawyer, Vol 2, No 4, p 347-351, Nov 1969. 5 p.

Descriptors: *Continental shelf, *Continental slope, *Law of the sea, *United States, Marine geology, Legal aspects, Easements, Federal jurisdiction, International law, Commercial fishing, Boundaries (Property), Water resources, Mineralogy, Fishing, United Nations, Oceans, Oil fields, Exploration, Federal government.

Suggestions are offered for modifying the United States' present policy regarding use of offshore resources. This policy rests upon an interpretation of findings made by the 1958 Geneva Convention on the Continental Shelf. Present United States' policy is considered to be too restrictive. It is urged that American jurisdiction should extend to the limits of the 'continental terrace', which includes the continental slope as well as the continental shelf. The United States should assert exclusive jurisdiction over submarine mineral development and over management and disposition of sea food resources within the limits of the terrace. The United States has adopted United Nations' guidelines which give sovereign rights to a coastal nation for limited exploration and exploitation of an area outside the territorial sea extending to a depth of 200 meters. It is concluded that the United States ought to have this definition of the exploitability modified to embrace the entire continental terrace. It is further concluded that it is in the best interests of the United States to claim exclusive fishery rights in the waters superjacent to the continental terrace and to seek international recognition of this claim. (Barnett-Florida)
W70-03627

WATER RESOURCES (APPROPRIATION OF WATER RESOURCES AND RIGHTS).
Miss Code Ann secs 5956-01 thru 5956-08, 5956-10 thru 5956-24 (Supp 1968).

Descriptors: *Mississippi, *Appropriation, *Beneficial use, *Prior appropriation, Legal aspects, Administration, Administrative agencies, State governments, Water rights, Preferences (Water rights), Relative rights, Alteration of flow, Diversion, Water users, Dams, Reservoirs, Water levels, Diversion dams, Interstate compacts, Surface waters, Water conservation, Water utilization, Permits, Legislation, Water districts.

To conserve and to put the water resources of Mississippi to their highest beneficial use, all natural bodies of water are made subject to appropriation and placed under the control and development of the state. The Mississippi Board of Water Commissioners is created to administer the act which deals with: (1) the definition, acquisition, and termination of water rights; (2) application for appropriation of water; (3) the employment of a water engineer; (4) powers and duties of the Board; (5) inventory of water resources; (6) cooperation of the Board with other agencies; (7) creation of water districts; (8) unappropriated waters; (9) applications for permits to acquire appropriate rights and to construct appropriation diversion works; (10) construction of dams and reservoirs; (11) compacts and agreements; (12) surveys; and (13) diversion of watercourses. Surface water, domestic uses, municipal use, beneficial use, appropriator, appropriation, watercourse, established average minimum flow, and established average minimum lake levels are defined. (Marsee-Florida)
W70-03635

WATER RESOURCES (BOARD OF WATER COMMISSIONERS).
Miss Code Ann secs 5956-01 thru 5956-08, 5956-10 thru 5956-14 (Supp 1968).

Descriptors: *Mississippi, *Appropriation, *Administrative agencies, *Beneficial use, Prior appropriation, Legal aspects, Administration, State governments, Water rights, Preferences (Water rights), Relative rights, Water users, Dams, Water levels, Surface waters, Water conservation, Water utilization, Leadership, Domestic water, Spring waters, Water districts.

All natural bodies of water are subject to appropriation and placed under the control and development of the state. However, ground or subterranean water rights or usage are not affected. No right to appropriate or use water subject to appropriation shall be acquired except upon compliance with this act. However, nothing herein shall interfere with the customary use of water for domestic purposes nor prevent a landowner from using a spring arising on his land. Moreover, any person may construct a dam across streams having the minimum flow specified herein. Water appropriation shall be equal to other property rights and may only be terminated as provided herein. To administer this act a Board of Water Commissioners is created. Its powers and duties shall be to: (1) employ a water engineer; (2) cooperate with other agencies; (3) inventory water resources; (4) establish the rights of present beneficial water users; and (5) divide the state into water districts. Surface water, appropriation, watercourse and domestic use are defined. (Marsee-Florida)

WATER RESOURCES (APPLICATIONS TO APPROPRIATE).
Miss Code Ann secs 5956.15-5956.24 (Supp 1968).

Descriptors: *Mississippi, *Appropriation, *Administrative agencies, *Beneficial use, Prior appropriation, Legal aspects, Administration, State governments, Water rights, Preferences (Water rights), Relative rights, Alteration of flow, Diversion, Water users, Dams, Reservoirs, Diversion dams, Interstate compacts, Surface waters, Water conservation, Water utilization, Permits, Watercourses (Legal), Legislation, Water districts.

An application must be made to the Board of Water Commissioners in order to acquire an appropriate right to any surface streams, lakes, or other watercourses of Mississippi for beneficial use. Upon examining the maps, plats and other information filed with the application, the Board may approve the same and issue a permit authorizing the construction of diversion works to perfect the appropriation. Persons desiring to construct dams or reservoirs on any watercourse specified herein must obtain a written statement from the Board that such construction will not affect plans for the proper utilization of the water resources of the state. The Board may also: (1) enter into compacts and agreements concerning interstate watercourses; (2) enter upon lands to make surveys; and (3) regulate the diversion of watercourses. The Board shall aid in the distribution of water in accordance with court orders. (Marsee-Florida)

SHAD FISHING IN THE DELAWARE RIVER, BAY, AND TRIBUTARIES.

Pa Stat Ann tit 30, secs 431-438, 441, 461 (1958).

Descriptors: *Pennsylvania, *Delaware River, *Permits, *Fish conservation, Regulation, Fishing gear, Nets, Fyke nets, Gill nets, Trapping, Legislation, Legal aspects, State governments, Fish, Administrative agencies, Interstate compacts, Federal government, New York, Delaware, New Jersey, Fishing, Rivers, Bays, Tributaries, Fish management.
Identifiers: *Shad fishing.

In accordance with the purposes of the Atlantic States Marine Fisheries Compact and in order to restore shad in the Delaware River, this act establishes a license system designed to control increases in fishing pressures in the Delaware. Licensing procedures are set forth. Only the fishing gear designated herein may be used to take shad in the Delaware River, Delaware Bay, and their tributaries. Permitted gear is regulated and includes the following: (1) haul seines; (2) fyke or hoop nets; (3) stake gill nets, either stake or anchored; (4) drift gill nets; and (5) hand lines, including rod and reel. Closed seasons are established, and the location of nets governed. The Pennsylvania Fish Commission is authorized to confer with New York, New Jersey, Pennsylvania, and Delaware officials and may enter agreements with respect to the coordination of research, enforcement, and other operations necessary to joint shad management. The Pennsylvania Fish Commission is authorized and directed to cooperate with the federal government in those fish restoration and management projects contemplated by specified act of the United States Congress. (Marsee-Florida)

DAMS AND BRIDGES (PROCEDURES REGARDING WATER POWER PERMITS).

Wis Stat Ann secs 31.095-31.17 (1967), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Permits, *Dam construction, *Bridges, Administrative agencies, Legislation, State governments, Local governments, Electric power, Powerplants, Hydroelectric plants, Regulation, Boundaries (Property), Operation and maintenance, Utilities, Dams, Resources, Public utilities, Reservoirs.

Acquiescence to rates set by the Department of Resources Development and the Public Service Commission for electric power distributed to users within the state is a condition precedent to the issuance of a water power permit. Permits will be void unless the dams which they authorize are completed within five years. Necessary and reasonable two-year extensions may be given. The grantee of a permit must submit a map and profile of the plans and specifications of the structure to the Department. The Department may reject, modify, or approve such plans. A verified statement of compliance with those plans must be submitted to the Department within ten days of the dam's completion. With the Department's permission, existing dams may be raised or enlarged. No permit will be granted when there is no proof of ability to operate and maintain the proposed dam or if objections are filed by the municipalities in which the dam is to be located. Existing dams may be acquired by any corporation engaged in the business of furnishing power to the public. (Barnett-Florida)
W70-03640

PUBLIC DOMAIN AND TRUST FUNDS (DAMS AND BRIDGES).
Wis Stat Ann secs 31.18-31.26 (1967), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Permits, *Bridges, *Dams, Hydroelectric power, Administrative agencies, State governments, Legislation, Local governments, Legal aspects, Navigable waters, Nonnavigable waters, Sluices, Dam construction, Dam failure, Hydraulic structures, Hydroelectric plants, Regulation, Inspection, Navigation, Detention reservoirs, Safety, Operation and maintenance.
Identifiers: Nuisances.

Various obligations with regard to public safety and convenience must be met by those who own and operate bridges and dams within the state. Any action concerning construction, operation, and maintenance of these structures is subject to prior permission of the Department of Resources Development. Dams capable of producing a minimum of 750 horsepower shall be inspected yearly. At other times, inspections shall be made upon allegations by a mayor or village president that a dam or reservoir is unsafe and a danger to the public. An annual inspection fee shall be paid by bridge and dam owners. Transfers of permits are controlled by the Department and the duration of contracts under such permits for the distribution of power is limited. Any dam maintained as an unlawful combination to restrict hydroelectric power may be taken over by the state through receivership proceedings. Private citizens may build bridges on navigable waters with the permission of the Department. Bridges and dams not built in accord with this act are public nuisances. Liens may be imposed upon bridges and their approaches to secure judgments obtained as a result of damage caused by their operation. (Barnett-Florida)
W70-03641

HIGHWAYS, BRIDGES, DRAINS (MISCELLANEOUS HIGHWAY PROVISIONS).

Wis Stat Ann secs 86.20-86.23 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Bridge construction, *Bridges, *Boundaries (Property), Legislation, Local governments, Abutments, Piers, Railroads, State governments, Navigable waters, Interstate rivers, Rivers, Legal aspects, Condemnation, Administrative agencies, Financing, Cities, Public utilities, Transportation.
Identifiers: *Toll bridges, Approaches.

Any corporation authorized by Congress to build and maintain a bridge over navigable boundary waters of Wisconsin shall have all the rights and powers, with respect to entry and acquisition of real estate, that railroad corporations now possess. Any county, town, or village bordering navigable waters which form a boundary line of this state may construct a foot and vehicular toll bridge across such waters. The governing bodies of such municipalities must adopt a resolution authorizing such construction and specifying the method of financing. Financing may be either through the proceeds of bonds, taxation, or from the general fund. Twenty percent of the electorate may file a petition requesting that the question of acquisition of such toll bridges be submitted to them. Bonds are to be repaid solely from the revenues of bridge operation. For purposes of management, two or more bridges may be combined as a single public utility. Any bridge corporation franchised to construct, operate, or maintain a railroad bridge or a passageway across waters forming a boundary line of this state must maintain such bridge in accessible condition with serviceable approaches. All swing or drawbridges built jointly by two municipalities shall be maintained by each in proportion to the cost of construction borne by each. (Barnett-Florida)

6F. Nonstructural Alternatives

LINCOLN'S EXPERIENCE IN REGULATING FLOOD PLAIN DEVELOPMENT,
Lincoln City-Lancaster County Planning Commission, Nebr.
James H. Schroeder.
In: Flood Plain Management, Iowa's Experience, ed. by Merwin D. Dougal (Ames, Iowa: Iowa State University Press, 1960), Chapter 20, p 237-245. 1 fig, 3 ref.

Descriptors: *Flood plains, *Regulation, Management, Flood plain zoning, Utilities, City planning, Multiple-purpose projects, Parks, Watershed management, Administration.

In the past eight years much has been done in the form of corrective and preventive flood measures within the Lincoln area. Comprehensive plans developed in 1952 and in 1960 have recognized the flood problem. The 1960 comprehensive plan pertains both to the city area and to the whole of Lancaster County. It includes limiting the development allowed in the flood plain area. This is done in two ways: (1) lands which lie in the flood plains are designated to be part of the community's park system, and (2) where it is not possible to include the land in the park system, the development of the land within the flood plain is kept at an absolute minimum. Lincoln enforces the latter by controlling the expansion of municipal utilities, i.e. not expanding utilities into areas subject to inundation by the 100 year flood. In addition, corrective flood control measures have been installed. Lincoln is included in the Salt Creek Watershed District formed in 1960 and has benefited from the construction of nine large dams, and channel improvements along Salt Creek. The author emphasizes the need for public and administrative cooperation, sound technical planning and public support to implement a successful comprehensive program for a city. (Marriott-Chicago)
W70-03341

THE ROLE OF OPEN SPACES IN FLOOD PLAIN MANAGEMENT,
Commissioner of Parks and Public Property, Cedar Rapids, Iowa
Donald K. Gardner.
In: Flood Plain Management, Iowa's Experience, ed. by Merwin D. Dougal (Ames, Iowa: Iowa State University Press, 1969), Chapter 12, p 137-146. 4 fig, 12 ref.

Descriptors: *Flood plains, *Management, *Parks, *Flood control, Multiple-purpose projects, Nonstructured alternatives, Recreation facilities, Water sports, Golf courses, Water resources development, Preservation.
Identifiers: *Open space, *Cedar Rapids, (Iowa).

Using Cedar Rapids, Iowa as an example this article emphasizes the need for a balanced allocation of land use in urban areas, and the compatibility of open-space needs with concepts of optimum flood plain utilization and minimum flood plain occupancy. It is accepted that open-space is necessary for parks and recreational facilities. Flood plains provide open space, good recreation possibilities, are cheaper to acquire than other land sites, and create hazardous situations when used for industry, commerce and housing. A program is proposed which would include acquisition of a greenbelt which would encompass at least the design floodway, natural or improved, covering an area of twenty-five miles and 2,000 to 3,000 acres of land. Where high population densities were anticipated, this greenbelt would be expanded to include areas for playgrounds, athletic uses and major picnic centers. Some of these uses have been experimented with already with good results. Special studies of the three creeks which affect the city have been made so that the city administration has sufficient information in formulation of flood plain policy. Other aids in an open-space program are the Department of Housing and Urban Development and the Land and Water Conservation Fund program of the Department of Interior Bureau of Outdoor Recreation. (Marriott-Chicago)

6G. Ecologic Impact of Water Development

WATER AND MAN: A WORLD VIEW,
Geological Survey, Washington, D.C. Water Resources Div.
Raymond L. Nace.
Paris, France, UNESCO, 1969. 46 p, 7 photo.

Descriptors: *Water resources development, *International Hydrological Decade, *Reviews, Water management (Applied), Water quality, Environmental effects, Environment, Ecology, Planning.
Identifiers: IHD programs.

Civilization's dependence on the world's water resources is discussed. Not only does our civilization depend on water availability, but water resources are profoundly affected by civilization. Water development and water policies always have been important, as is evident from the many physical and administrative measures to control its distribution and use, beginning with the ancient Sumerians of Mesopotamia and becoming ever more complex with the passage of time. Even so, water problems are becoming increasingly critical in many regions, including areas in developed countries where water is relatively abundant. The reason is that in many regions problems are less apt to relate to water quantity than to its quality. Broadly stated, water problems are few but basic: distribution in space (too much or too little); distribution in time (too much in some seasons or years and not enough in others); chemical quality (too highly mineralized; lacking in desirable minerals; containing deleterious minerals); and pollution. The International Hydrological Decade was established, starting in 1965, to study world water problems. The general purpose of the IHD is to accelerate scientific study of water resources and water regimes in order to improve water conservation, management and use. The bulk of the IHD programe consists of activities by participating States within their own territories, catalyzed, co-ordinated and supplemented by international intergovernmental organizations and scientific associations. The programe covers the entire field of hydrology from collection of standard basic data to advanced basic research. (Knapp-USGS)

ARROGANCE TOWARD THE LANDSCAPE: A PROBLEM IN WATER PLANNING,
Geological Survey, Washington, D.C. Water Resources Div.
Raymond L. Nace.
Bulletin of the Atomic Scientists, Vol 25, No 10, p 11-14, Dec 1969. 4 p, 2 photo.

Descriptors: *Water resources development, *Planning, *Projects, *Surveys, *Reviews, Ecology, Urbanization, Land management, History.
Identifiers: Water development history.

The effects of water resources development on water supplies and the environment are surveyed. Water is much more than just a resource to be manipulated on the basis of water data and engineering works. In a society, demands and values change, so no final solution for water problems will be found at any time, and planning must be a continuing process. Rational planning and decision require a base of pooled knowledge from geologists, hydrologists, ecologists, engineers, economists, sociologists, managers, lawyers, politicians and others. Water and its movement through the hydrological cycle are essential means for maintaining the heat balance in the complex system of the earth and its inhabitants. Water is the prime agent that shapes or misshapes the landscape, according to what kind of landscape it encounters. Men have much to do with the latter. Is it mere coincidence that Persia, Egypt, West Pakistan, India, and China--all 'underdeveloped' areas today--were the seats of the oldest civilizations. Perhaps it is an inherent characteristic of civilization that it wears out its landscapes. Human occupation, at least during the past 2,000 years, has operated chiefly to harm the landscape, not to preserve it. Ability to plan and create monumental projects carries with it the likelihood of making monumental mistakes. Planning must include careful analysis of the possible results of any water development schemes. (Knapp-USGS)

7A. Network Design

THEORETICAL FOUNDATION OF HYDROMETRY (RUSSIAN),
G. V. Zheleznyakov.
Leningrad, Gidrometeorologicheskoye Izdatel'stvo, 1968. 291 p, 104 fig, 41 tab, 103 ref.

Descriptors: *Water measurement, *Instrumentation, *Hydrometry, Streamflow, Water levels, Velocity, Turbulent flow, Gages, Hydrometers, Current meters, Weirs, Runoff, Discharge (Water), Hydraulics, Flood plains.
Identifiers: *USSR.

The theoretical aspects of hydrometry are discussed and the procedures used in carrying out hydrological observations in rivers and river channels are given. Hydromechanical analyses of instruments for measuring current velocities are also given. The discussion includes: open water surface relief and depth of nonuniform flow; velocity distribution in open turbulent flows; bottom velocities of open streamflows; use of hydrometric devices in open streamflow; hydromechanical analysis of current meters; foundation of the procedures for measuring small velocity streamflows; hydrometric weirs; shape parameters of open-streamflow cross sections; hydraulic and hydrometric methods for the determination of discharges in open river channels; interaction between the flood plain and channel streamflows; and hydraulic basis of the dependence of water levels on streamflow discharges. (Gabriel-USGS)
W70-03474

THE EFFECTIVENESS OF COLLECTING HYDROLOGIC DATA AT MAYNARD CREEK WATERSHED VIA A DATA ACQUISITION SYSTEM,
Montana State Univ., Bozeman. Water Resources Research Center.
Theodore T. Williams, and Duain Bowles.
Available from the Clearinghouse as PB-189 407, $3.00 in paper copy, $0.65 in microfiche. Montana University Joint Water Resources Research Center, Report No 11, Sept 1968. 40 p, 3 tab, 3 fig, 1 ref, 2 append. OWRR Project A-006-MONT.

Descriptors: *Data collections, *Data transmission, *Hydrologic data.
Identifiers: *Collecting hydrologic data, *Acquisition system, *Digital signals, Teletype machines, Electronic instruments.

Three recording rain gages, three recording hygothermographys and three Parshall flumes equipped with water level recorders were installed on the Maynard Creek watershed. The instruments were modified to permit the simultaneous tranmission of data over the Bridger Data Acquisition System to the Montana State University campus. Conclusions are that a Data Acquisition System provides many advantages to a hydrologic researcher, but that certain recommendations should be considered: (1) Avoid 'piggy-back' parallel operation of electronic instruments through modification of conventional instruments. (2) Convert analog to digital signals at the instrument, and transmit only digital signals via telemetry. (3) Avoid long 'ground surface' cabling networks. (4) Review data promptly and regularly to spot any malfunction that may arise.

ECOLOGICAL TECHNIQUES UTILIZING RADIONUCLIDES AND IONIZING RADIATION - A SELECTED BIBLIOGRAPHY,
Washington State Univ., Pullman. Dept. of Zoology.
Vincent Schultz.
US Atomic Energy Commission, Division of Technical Information, RLO-2213-1, Dec 1969. 252 p, 3081 ref.

Descriptors: *Bibliographies, *Radioecology, *Radioisotopes, *Radioactivity, *Radiation, Aquatic environments, Terrestrial habitats, Analytical techniques, Environmental effects, Tracers, Pesticides.
Identifiers: *Ecological techniques, Data acquisition, Freshwater environments, Marine environments.

Environmental deterioration has increased public awareness of the ecologist's role in predicting and alleviating the effects of cultural misuse of the environment. Complexities of the problems, now and in the future, require that ecologists develop and utilize the most advanced techniques possible to elucidate information which can be used for intelligent and effective decisions regarding environmental management. This bibliography of 3081 entries attempts to focus the attention of all ecologists on techniques utilizing radionuclides and ionizing radiation developed by freshwater, marine, and terrestrial ecologists, as well as by scientists in closely related fields. Of all references cited, with publication dates between 1922 and 1969, approximately 87% are dated in the decade beginning 1960. The most recent literature and Russian contributions are well represented in the list. (Eichhorn-Wisconsin)

NONDESTRUCTIVE TESTING,
Machine Design, Cleveland, Ohio.
Francis J. Lavoie.
Mach Des, Vol 41, No 20, p 122-135, Sept 1969. 14 p, 19 fig

Descriptors: *Non-destructive tests, *Materials testing, *Test procedures, Radiographic inspection, Quality control, Inspection, Materials engineering, X-ray inspection, Gamma rays, Neutrons, Fluoroscopes, Ultrasonics, Thermographs, Penetration, Microwaves, Acoustic equipment, Measuring instruments.
Identifiers: *Testing equipment, Radiography, Ultrasonic tests, Eddy currents, Stress waves, Holography, Acoustic method.

This review of nondestructive test methods ranges from the established and widely known methods to the newest and most glamorous, and includes flaw or defect-finding techniques. The methods described are: radiography, ultrasonics, thermal techniques, penetrants, magnetic inspection, microwaves, eddy current, acoustic emission, and holography. Radiographic methods include X-ray, gamma ray, neutron, radiation backscatter, fluoroscopy, color radiographs, and xeroradiography. Holography, one of the most glamorous developments in recent years, is well suited for flaw detection. (USBR)
W70-03356

A RAINFALL RATE SENSOR,
Coast and Geodetic Survey, Rockville, Md.
Brian E. Morgan.
ESSA Tech Memo ERLTM-NSSL 42, Nat Severe Storms Lab, Norman, Okla, Nov 1968. 10 p, 7 fig, 2 ref.

Descriptors: *Rainfall, *Rain gages, *Meteorological instruments, *Hydrologic instruments, Rain, Measuring instruments, Instrumentation, Meteorology, Hydrology, Thunderstorms, Meteorological radar, Sensors, Oscillators, Capacitance, Electrodes.
Identifiers: Hydrometeorology.

A rainfall rate measuring instrument that has a range of 250 mm/hr, an accuracy of plus or minus 2 mm/hr, and gives total rainfall within 2% was developed. The gage is inexpensive to build and operate, and does not require daily attention because water does not accumulate. Rainwater passes from a collector into a cylindrical reservoir formed between 2 concentric electrodes. Water empties from the reservoir through a small nozzle at the base. Water depth in the reservoir is related to the inflow or rainfall rate that varies the capacitance between the 2 electrodes. The rainfall rate is measured by an oscillator having the electrodes as capacitance elements that translate depth changes into frequency variations. Equations are developed for relating rainfall rate to frequency, with emphasis on relevance to design of the instrument for specific applications. Laboratory test results and rainfall measurements are discussed. (USBR)
W70-03363

A NON-DESTRUCTIVE CORE ANALYSIS TECHNIQUE USING X-RAYS,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Geology.
Seymour R. Baker, and Gerald M. Friedman.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1371-1383, Dec 1969. 13 p, 18 fig, 4 ref. ONR Contract No N000 1467-A-0117-0004.

Descriptors: *X-ray analysis, *Analytical techniques, *Sediments, *Cores, Stratigraphy, Structural geology, Sampling, Instrumentation, Particle size, Carbonates, Photography.
Identifiers: X-ray core analysis technique.

An X-ray technique which permits the identification of sedimentological, stratigraphic, and structural characteristics of core samples is described. This technique utilizes an aluminum filter which compensates for the difference in sediment thickness through which the X-ray penetrates. This quick, easy, and inexpensive method provides a complete picture log of the core. (Gabriel-USGS)

REDUCTION OF SERIALLY CORRELATED HYDROLOGIC DATA,
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
Rafael G. Quimpo.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 111-118, Dec 1969. 8 p, 1 fig, 10 ref.

Descriptors: *Statistical methods, *Data processing, *Hydrologic data, *Streamflow, *Correlation analysis, Sampling, Parametric hydrology, Data collections, Water supply, Regression analysis, Storage, Digital computers.
Identifiers: Serial correlation.

The need for specifying water availability in terms of its time sequence and distribution, rather than in terms of lumped quantities or flow duration, gives rise to data acquisition programs which use shorter sampling intervals. Shorter time intervals, in turn, resulted in serially correlated observations. In order to determine the reliability of design variables derived from these observations, it is necessary to reduce data to an equivalent series of independent observations, or find the effective length of the series. A general parametric formula is developed to give the effective number of observations of the second order autoregressive process, which was found to apply to series of mean daily river flows. Different values of the parameters were programmed in a digital computer to obtain tables for data reduction. (Knapp-USGS)

VARIATIONS IN STATISTICAL MEASURES WITH THE LENGTH OF STREAMFLOW RECORDS,
Waterloo Univ (Ontario).
B. P. Sangal, T. E. Unny, and H. M. Hill.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 41, p 314-321, 1967. 8 p, 2 fig, 4 tab.

Descriptors: *Streamflow forecasting, *Statistical methods, Climatology, Regression analysis, Data processing, Digital computers, Computer programs, Hydrologic data.
Identifiers: Streamflow record length.

Hydrologic data are necessary in the planning and development of a water resource project. More and better data result in better project decisions. Unfortunately, often important decisions have to be made in spite of hydrologic deficiences. This paper describes a statistical analysis of long (48 years) flow records of five streams in Southern Ontario (Canada). The computations are carried out at the University of Waterloo IBM 7040 computer. Records of 20-25 years are considered adequate for the estimation of mean annual runoff. The results are considered acceptable within 10-15 percent of their long-term values. (Knapp-USGS)

CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO WATER QUALITY STATIONS,
Geological Survey, Washington, D.C. Office of Water Data Coordination.
K. F. Harris, J. R. Rapp, and E. B. Chase.
Available at no cost from Office of Water Data Coordination, US Geol Survey, Wash, DC, 20242. Geological Survey Water Data Catalog, 1969. 391 p, 2 fig, 2 exhibit, 4 tab.

Descriptors: *Data collections, *Hydrologic data, *Water quality, *Documentation, *Data storage and retrieval, Networks, Monitoring, Sampling, Maps, Instrumentation, .Stations, Libraries, Investigations.
Identifiers: *Catalog of Information on Water Data.

An index is presented for use in retrieving water quality data from the Catalog of Information on Water Data, a record of activities in water data collection in the U. S. The Catalog is a file of information that is accessible through data-retrieval procedures--it contains information about water-data acquisition activities but does not contain the actual data, which must be obtained from the reporting agencies. Input to the Catalog consists of information supplied by Federal, State, and local agencies that acquire water data directly in the field and laboratory. All information is stored on media suitable for data processing, supplemented by microforms and maps. Information from the Catalog (output) is made available through indexes such as this publication, which is the index to the water quality section of the Catalog. The indexes help the water-data user determine the data that are available for an area and also the data available from a reporting agency. The index includes the title of each investigation reported, the geographic area covered, a description of types of data collected, whether or not a report will be published, and the reporting agency. STREAMFLOW EFFECTS IN A STRATIFIED MODEL RESERVOIR,
Oregon State Univ., Corvallis.
E. Harvey Elwin, and Larry S. Slotta.
ASCE National Water Resources Engineering Meeting, Jan 26-30, 1970. Preprint, 38 p, 30 ref, 17 fig.

Descriptors: *Model studies, *Stratification, *Quality control, *Density currents, Streamflow.

This study relates various parameters of entering streamflow at the upper end of a stratified reservoir to the current regime in the reservoir for the purpose of maintaining quality control. The model reservoir for the inflow experiments was a clear walled, rectangular, plexiglas flume. It was equipped with an adjustable bottom slope and a connecting streambed slope. The reservoir was 25 feet long, 18 inches wide, and 22 inches deep. Various concentrations of a sodium chloride solution were used to provide a linear density stratification. Flowfield current patterns and velocity measurements were determined photographically. Flow parameters relating the existence, location and magnitude of model internal density currents to entering streamflow characteristics were found. The applicability of these model reservoir results to prototype reservoir conditions is discussed. Some conclusions were: (a) For the range of values tested the entering model streamflow created two possible main inflow density currents in the model reservoir. (b) The upper inflow current increased its magnitude as the model streamflow Reynolds number increased. (c) The elevation of the upper inflow current was independent of the velocity and density of the inflow. The evaluation of the lower inflow current was dependent on the density of the inflow and the mixing which occured at the stream mouth. (d) The interaction between two reservoir density currents created a significant reinforcement of both currents. (Guerrero-Vanderbilt)
W70-03543

MECHANICS OF STRATIFIED FLOW THROUGH ORIFICES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Joseph R. Bohan, and John L. Grace.
ASCE National Water Resources Engineering Meeting, Memphis, Tenn, Jan 26-30, 1970. Preprint, 33 p, 22 ref, 12 fig.

Descriptors: *Stratified flow, *Orifices, *Model studies.

Identifiers: *Velocity distribution, *Water intakes.

The purpose was to determine the characteristics of the withdrawal zone upstream of an orifice for various conditions of stratification in order to develop generalized equations for use in predicting the quality of water discharged through similar openings in prototype intake structures. The experimental facilities contained an orifice cut in a piece of plastic and located in the center of a 1-ft. wide channel. Approximately 18 ft. of the 1-ft. wide, 2-ft. deep channel was provided upstream of the orifice and a headbay 40 feet long, 16 feet wide, and 4 feet deep was provided upstream of the channel. Stratification was generated using dissolved solids (salt). Temperature and salinity gradients were measured in place by means of commerically available instrumentation. All the tests were conducted with steady uniform flow conditions. Some conclusions were: (a) A means of predicting the limits of and the velocity distribution within the zone of withdrawal upstream of an orifice has been developed. (b) Three dimensional models operated in such a manner that they reproduce typical hydrograph records should be utilized to investigate the effects of unsteady and varied flow conditions due to variations in geometry, inflow, outflows, storage and density. (c) Additional studies are desired to investigate model scale effects and the relative importance of viscous effects. (d) The effect of geometry in the vicinity of an intake structure has been observed to be significant based on the results of specific model studies. (Guerrero-Vanderbilt)
W70-03544

ENTRAINMENT PRINCIPLE AND ITS RESTRICTIONS TO SOLVE PROBLEMS OF JETS,
Waterloopkundig Laboratorium, Delft (Netherlands).
G. Abraham.
Journal of Hydraulic Research, Vol 3, No 2, p 1-23, 1965. 6 fig, 1 tab, 18 ref.

Descriptors: *Jets, *Buoyancy, *Turbulent flow.
Identifiers: *Entrainment.

Studies were made of the theories for solution of jet problems based on both the entrainment principle and the similarity of velocity and concentration profiles. Jets with negligible and with predominant influence of buoyancy effects are described. The implications of the contradictory starting points which are based on both the entrainment principle and the similarity of velocity and concentration profiles are explained, and a new coefficient is introduced. This parameter, E', is a dimensionless representation for the rate at which work is done by turbulent shear. Conclusions were: (a) the similarity of velocity and concentration profiles is shown to imply that the entrainment coefficient alpha is a variable quantity. Accordingly, theoretical solutions based on both the similarity of velocity and concentration profiles and on the entrainment principle, which implies alpha to be constant, are based on contradictory starting points, (b) theoretical solutions based on the assumption of alpha being constant may give incorrect values of the ratio of the radius of the jet to the distance from the orifice, (c) the similarity of velocity and concentration profiles was shown to be compatible with the assumption of the parameter E' being constant. (Guerrero-Vanderbilt)

DISCUSSION OF 'TURBULENT MIXING PHENOMENA OF OCEAN OUTFALLS' BY R. FRANKEL AND J. CUMMING,
California Inst. of Tech., Pasadena, Calif. W. M. Keck Lab. of Hydraulics and Water Resources.
Loh-Nien Fan, and Norman H. Brooks.
Journal of the Sanitary Engineering Division, Proceedings of ASCE, Vol 92, No SA1, p 296-300, Feb 1966.

Descriptors: *Mixing, *Stratification, Froude number.
Identifiers: *Buoyant plume, Model.

Research performed by Frankel and Cumming provided greater insight into the problem of mixing of a buoyant plume in a homogeneous environment such as jet discharges of sewage effluent from ports in an ocean outfall diffuser, when the ocean is not density-stratified. The effect of the free surface is discussed, and it is concluded that the wide discrepancy between Frankel and Abraham's theory is not explained by the effect of the surface zone and that the thickness of the transition zone should be considered not only as a simple proportion of the depth but also as a function of the parameters of the rising plume, depth-diameter ratio, Froude number and the discharge angle. Furthermore, the thickness should also be related to the character of the horizontal surface flow layer as well as the rising plume. In performing experiments in the laboratory, it was found more convenient to inject salt solutions into fresh water and observe the pattern of the falling plume. In the discussion of the asymptotic rate of change of measured concentration with depth, a contradiction was found to the author's conclusion that for large depth-diameter ratio, the exponent in the equation approaches one. The conclusion that 'further increases in depth beyond depth-diameter ratio equal 50 give minimal advantages to mixing in the vicinity of the discharge point', is disputed and an example is given. JET DIFFUSION, REVIEW OF MODEL TESTING AND COMPARISON WITH THEORY,
Chalmers Univ. of Technology, Goteborg (Sweden). Hydraulics Div.
Klas Cederwall.
Chalmers Institute of Technology, Goteborg, Sweden, Feb 1967. 28 p, 17 ref.

Descriptors: *Jets, *Diffusion, *Testing, *Model studies, *Outlets, *Sewers.

The significance of laboratory investigations in solving various jet diffusion phenomena is discussed. Pertinent parameters such as the density and composition of the disposed effluent, hydraulic characteristics of sewage discharge, and oceanographic features of the disposal site area and boundary conditions are analyzed. The possibilities of reproducing field data in model tests, model laws on jet diffusion, tracer technique, sampling and recording devices are discussed. The study on jet diffusion in stagnant receiving water carried out by Abraham serves as a basis for discussion of the experimental studies on jet diffusion and a comparison with theory in the cases of vertical jet diffusion, horizontal jet diffusion and high velocity release. In most cases, a fair agreement was found between the analytical procedure and experimental data. (Guerrero-Vanderbilt)

DISCUSSION OF 'HORIZONTAL JETS IN STAGNANT FLUID OF OTHER DENSITY' BY G. ABRAHAM,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Hydraulics and Water Resources.
Loh-Nien Fan, and Norman H. Brooks.
Journal of the Hydraulics Division, Proceeding ASCE, Vol 92, HY2, p 423-429, Mar 1966.

Descriptors: *Jets, *Stratification, Turbulent flow.
Identifiers: *Entrainment rate.

Abraham's representation of the entrainment rate in the jet is discussed, and it is mentioned that one of the main difficulties in analysis of turbulent jets is to specify the rate at which fluid is entrained in the jet or alternatively to specify the rate of growth of the plume or jet. The writers suggest an alternative to the author's representation of the entrainment rate, assuming that the rate of entrainment is proportional to the local characteristic (or maximum) velocity, um, and the local characteristic radius of the jet or plume, following the techniques used by Morton, Taylor, and Turner, and Morton. By this means, full use is made of the continuity equation. An analysis of how the problem solved by Abraham can also be readily solved using the continuity equation with constant entrainment coefficient is made. The results agree with Abraham's and thus suggest that the simple entrainment formula is as valid as the author's approach, with the advantage that is more flexible and can be used on a wider variety of problems, such as those involving buoyant jets and plumes in a stratified environment. STATISTICAL PROPERTIES OF BED FORMS IN ALLUVIAL CHANNELS IN RELATION TO FLOW RESISTANCE,
Iowa Univ., Iowa City. Dept. of Mechanics and Hydraulics.
Venkata Subramanya Shastri Annambhotla.
Ph. D. Thesis, University of Iowa, Aug 1969. 137 p, 9 tab, 27 fig, 50 ref. OWRR Project A-015-IA (5).

Descriptors: *Alluvial channels, Channel morphology, *Roughness (Hydraulic), *River beds, *Flow resistance, Fluid friction, Flumes, Hydraulic design.
Identifiers: *Bed forms (River), Hydraulic friction factor.

The statistical properties of dune bed forms in alluvial channels was investigated and related to the hydraulic friction factor. Emphasis was placed on the relationship between resistance to flow and bed configuration in large rivers. Bed profile records were acquired from a straight 3-feet wide laboratory flume and from the Missouri River at Omaha, Nebraska. Discrete digital data of the fine sand bed profiles were obtained from continuous records and statistical computations were performed. The river data were nonstationary both in the mean and in the mean square. A filter was selected to render the data stationary in the mean. Pilot studies, made by analyzing selected river data by spectral analysis and zero-crossing distances and amplitudes analysis, suggested that the latter of the two methods is preferable. Statistical properties of the wave lengths, amplitudes and heights were evaluated by the zero-crossing distances and amplitudes analysis for selected flume data and all river data. A study of the frequency distributions of the bed form characteristics showed that the bed elevations were approximately normally distributed and that the wave lengths, amplitudes and heights were approximately exponentially distributed. The bed form friction factor was plotted against a modified relative roughness parameter defined in terms of the bed form dimensions and the hydraulic mean radius of the flow. A more definitive resistance relationship could not be formulated, however, because of the limited number of observations and also because of inadequate information on the suspected effects of the variations in the shape and arrangement of dune forms. Effects of water temperature on bed form roughness were observed to be significant. The tendency in the Missouri River was that the bed forms became rougher with increasing temperatures and vice versa. Reasonably good measures of bed form characteristics can be obtained by statistical analyses.

FLOW BETWEEN A RESERVOIR AND A HEADPOND,
Spiridon Iliev.
Water Power, Vol 21, No 9, p 331-335, Sept 1969. 5 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Electric power production, *Forebays, Hydraulic engineering, Piping systems (Mechanical), Hydraulic properties, Pressure tunnels, Hydraulic design, Equations, Hydraulics, Continuity equation, Pressure pipes, Foreign research, Hydroelectric plants, Reservoirs, Hydroelectric power.
Identifiers: Design assumptions, Comparative studies, Bernoulli theorem, USSR.

Some costs of a hydroelectric system involving a reservoir remote from the power station may be saved by constructing a headpond near the station, thereby reducing the required diameter of the supply tunnel or pipeline. Using a headpond permits a reduction in installed capacity of the powerplant and makes possible a larger output because the local storage can be used with smaller losses and the limiting condition for critical velocity in the connecting supply tunnel or pipeline can be avoided. Equations are derived for solving the hydraulics of a supply system containing a headpond; a sample problem is presented. (USBR)

ENERGY REQUIREMENT AND ITS ROLE IN THE PAST, PRESENT, AND FUTURE DEVELOPMENT OF GRAND COULEE DAM,
Bureau of Reclamation, Boise, Idaho.
G. R. Barker.
Pap, 83rd Annu Gen Meet Eng Inst Can, Vanouver, Sept 1969. 13 p.

Descriptors: *Grand Coulee Dam, *Electric power production, *Peak power, Project planning, Irrigation, History, Multiple-purpose projects, Electric power, Investigations, Peaking capacities, Automation, Energy, Pumping plants, Pump turbines, Stators, Flood control, Hydroelectric plants, Columbia River, Hydroelectric power.
Identifiers: Grand Coulee Powerplant (Wash), Grand Coulee Pumping Plt (Wash), Pacific Northwest-Southwest Intertie, Base loads.

Factors affecting the development of Grand Coulee Dam from inception as a key structure for an irrigation project, through present-day multi-purpose operation, and into the future on a coordinated power peaking and irrigation pumping schedule are described. The history of the Grand Coulee Dam from 1918, with Rufus Wood's first published story of a proposed high dam on the Columbia River to the present-day 1974 mw of generating capacity and 6 pumping units capable of irrigating 600,000 acres of land, is reviewed. A program of rewinding existing 108-mw generators to produce 125 mw is scheduled for completion by 1977. Modernization features being initiated for automating the plant are discussed. Future installations call for a Third Powerplant of 12 units, 600 mw each, and 6 additional pump-turbine units in the pumping plant, bringing the ultimate capacity of the Grand Coulee Dam to 9771 mw, the largest single electric power generating station in the world. THE ELECTROCHEMICAL METHODS OF PROTECTING HYDROTURBINES AGAINST CAVITATION EROSION,
N. I. Pylaev, and A. A. Sotnikov.
Energomashinostr, Vol 14, No 2, p 26-28, 1968. Transl from Russ, Bur Reclam Transl 823, Oct 1969. 9 p, 5 fig, 3 ref.

Descriptors: *Cathodic protection, *Hydraulic turbines, *Cavitation, Laboratory tests, Electric fields, Corrosion, Anodes, Corrosion control, Cathodes, Foreign research, Electric potential, Conductivity, Protective coatings, Electrodes.
Identifiers: USSR, Current density, Test results, Cavitation control.

The electrochemical method of protection from cavitation erosion has been applied experimentally on turbines of a few hydroelectric powerplants. The method consists of the simultaneous use of protective zinc paint and cathodic protection from an external source. Under turbine operating conditions, evaluating the effectiveness of electrochemical protection is difficult. Laboratory experiments were conducted to study the effectiveness of cathodic protection; results are reported. From a study of the electric field in a model turbine, calculations were made of the cathodic protection parameters for the Krasnoiarsk turbines, indicating that no less than 400 v would be required. Such voltage cannot be considered permissible from a safety engineering standpoint. Efficient cathodic protection on large hydraulic turbines operating in water with high specific resistance becomes practically impossible. (USBR)

ASSESSING OUTDOOR INSULATION,
Centro Elettrotecnico Sperimentale Italiano, Milan.
P. Bernadelli.
Energy Int, Vol 6, No 8, p 20-24, Aug 1969. 5 p, 4 fig, 2 tab, 16 ref.

Descriptors: *Contamination, *Electrical insulators, Atmospheric pollution, *Electric insulation, *Laboratory tests, Test procedures, Lightning, Dusts, Salts, Foreign research, Test facilities, Air pollution, Air pollution effects, Bibliographies.
Identifiers: *Contaminants, *Leakage current, *Flashover, Italy, Switching surges, Lightning surges, Reproducibility, Electric discharges.

The problem of external electric insulation in contaminated areas is becoming increasingly important because of growing industrialization in continental areas and the location along sea coasts of large thermal powerplants with their associated substations and high voltage lines. In such particularly contaminated areas, pollution produces an insulation stress almost as important as that caused by lightning and switching overvoltages. Two laboratory testing methods, the salt fog method developed in England and the dust deposit method developed in Germany, are discussed and a cost comparison between the 2 types of installations is given. A general review of the present state of investigations on the behavior of external electrical insulation in contaminated atmosphere is given, with particular reference to a-c voltage stress. Available knowledge permits an engineering approach to insulation design problems. After sufficient experience, some laboratory testing method should become standarized by international bodies. (USBR)

EXPERIMENTAL HORIZONTAL BULB TURBINES FOR SARATOV HYDROPOWERPLANT,
M. L. Steklov.
Energomashinostr, No 5, p 6-10, 1969. Transl from Russ, Bur Reclam Transl 822, Oct 1969. 16 p, 3 fig, 5 ref, append.

Descriptors: *Hydraulic machinery, Kaplan turbines, Turbine runners, *Hydraulic turbines, Stay rings, Stay vanes, *Turbine parts, *Bearings, Draft tubes, *Bulb turbines, Prototype tests, Field tests, Generators, Oil reservoirs, Bearing capacities, Hydraulic design, Water cooling, Foreign research, Servomechanisms.
Identifiers: USSR, Experimental design, Saratov Powerplant (USSR), *Pressure control mechanism.

Two experimental Kaplan bulb turbines having the same dimensions but slightly different design will be installed at Saratov Hydropowerplant for field testing. The main difference in design is the method of supporting the units: The first has 2 bearings and inlet and outlet stay rings; the second, without the outlet ring, has an extra turbine bearing and cantilever support of the runner. Advantages of the second design are improved power characteristics and a reduction of more than 10% in weight, but the satisfactory support of the turbine without the outlet stay ring under all operating conditions must be demonstrated. All preliminary bearing tests indicate that the bearings with 2 fixed upper shoes and 8 self-leveling lower shoes will take double the normal operating load, but the Soviet turbine designers feel that this side-by-side prototype testing is necessary because of the increased size of these units in physical dimensions and capacity as compared to any operating units of the world. A new design of combined oil and water head in the bulb nose, reducing the overall space of this equipment, supplies the oil to the servomotors from the electrohydraulic governor system and the water to cool the generator rotor. HYDRAULIC CONTROLS OF WATER LEVEL,
E. E. Makovskii.
Gidrotekh i Melior, No 8, p 35-42, 1968. Transl from Russ, Bur Reclam Transl 688, Aug 1969. 18 p, 8 fig, 3 ref.

Descriptors: *Irrigation canals, Irrigation practices, Hydrodynamics, Irrigation systems, Automation, *Automatic control, Check structures, Foreign design practices, Irrigation operation and maintenance, Water measurement, Water surface profiles, Turnout gates, Remote control, Gates, Instrumentation, Mechanical equipment, *Water levels.
Identifiers: USSR, Water distribution.

Automatic remote control of water levels in all checks and drops in an irrigation system (cascade controls) has been developed and tested successfully in the USSR in the Atbashinsk Main Canal in Kirgiz SSR since 1963. Standard designs for cascade controls with downstream protection against overfilling are being perfected and tested for general use in the Northern Crimean Canal in the Ukraine. The mechanics and operating principles of several alternative designs of cascade control systems are investigated. Mathematics for designing such systems and graphs for determining the various gate parameters, such as vertical contraction of flow and depth of submergence, are given. This system of hydraulic controls probably gives more reliable and flexible water-level control with settings within wider limits than well-known foreign designs, especially where there are floating materials in the canal or significant drops in water level or rapid flow downstream. MHD POWER GENERATION: CURRENT STATUS,
Tennessee Univ., Tullahoma. Space Inst.; and Westinghouse Electric Corp., Pittsburgh, Pa. Research and Development Center.
J. B. Dicks, Stewart Way, and T. R. Brogan.
Mech Eng, Vol 91, No 8, p 18-25, Aug 1969. 8 p, 7 fig, 53 ref.

Descriptors: *Magnetohydrodynamics, Electric power, *Electric power production, *Magnetic fields, *Gases, Reviews, Experimental data, Ions, Bibliographies, Electrodes, Electric fields, Seeding, Efficiencies, Research and development, Economics, Excitation, High pressure.
Identifiers: Gas conductors, Fossil fuels, High temperature, Superconductors.

In magnetohydrodynamic (MHD) generation, a gas moves through a magnetic field to produce an electric current. The internal energy of the gas stream is converted directly to electric energy that is drawn off through electrodes replacing the brushes of conventional generators. The status of MHD generation is discussed and experimental MHD units ranging from 3 to 32 mw are reviewed. Three approaches to MHD power are explored, the open-cycle system, the closed-cycle system, and the liquid metal system. Of these 3 types, the open-cycle system is closest to practical realization. This report concentrates principally on the attainments, problems, and outlook for open-cycle MHD powerplants for commercial applications. (USBR)

MULTIPLE USE OF RIGHTS OF WAY: A CHALLENGE TO THE PAST,
Federal Power Commission, Washington, D.C.
Carl E. Bagge.
Pap, Conf Joint Util Rights Way, Deerfield, Mass, July 1969. 14 p.

Descriptors: *Right-of-way, Environment, Aesthetics, Project planning, *Multiple use, Planning, *Public utilities, Public relations, Ecology, *Public services, Legislation, Legal aspects, *Utilities, *Future planning (Projected).

Identifiers: *Land acquisition, Electric utilities, Regional planning, Regional authorities.

Joint rights of way for highways, energy transmission, and communications at appropriate distances from each other should be considered simultaneously with the development of comprehensive regional plans. The central theme of effective regional planning is the early acquisition of land for such public service rights of way. This is a matter of urgency in congested areas and a means of preventing serious problems in less populated areas. The form of acquisition could be determined easily once the philosophical commitment is made. Many public service companies share rights of way, and recently joint use has been emphasized by government, industry, and citizens groups as a promising means of minimizing the intrusion of utility rights of way on the quality of our environment. Examples are cited of low-voltage powerlines and telecommunications lines sharing rights of way with each other, as well as with railroads and pipelines. The coordinated efforts of the President's Council on Environmental Quality, the Citizens Advisory Committee on Environmental Quality, and the affected public service industries should provide the most effective level for meeting the challenges of multiple use. THE PRINCIPLE OF REINFORCED EARTH,
Bureau d'Etudes de la Terre Armee, Paris (France).
Henri Vidal.
Highw Res Rec, No 282, p 1-16, 1969. 16 p, 37 fig.

Descriptors: *Reinforcing, *Reinforcement, *Earth, *Earthworks, Foreign design practices, Retaining walls, Theory, Calculations, Economics, Soil mechanics, Soil Engineering, Comparative costs, Comparative benefits, Friction, Tensile stress, Strength, Structures, Stress, Soil strength.
Identifiers: Reinforcing materials, France, Comparative studies, Compressive stress, Flexible structures.

Reinforced earth structures have no height limit, are flexible, simple, and economical to build, and can be designed to support any external forces exerted upon them. Reinforced earth structures are composed of earth, reinforcing disposed in horizontal layers, and a flexible skin facing for retaining the earth particles not in contact with reinforcing strips. Reinforcing elements can be any material possessing the necessary tensile strength and can be any shape giving the necessary friction surface in the required direction. Limitations on earth materials vary with the type of reinforcement used, the general condition being that sufficient friction exists between earth and reinforcement to generate the necessary tensile stresses in the reinforcement. For the conventional type of reinforcement, this condition is met by earth having a friction angle of about 25 deg. The first reinforced earth structures were built in 1964 and have been used for retaining walls, beams, foundation mats, and piers. Many other structures having varying shapes and sizes could be built. Walls to support highways or railways in urban areas, dams, cofferdams, and tunnels in embankments have been proposed or tested and design calculations developed. (USBR)

VIBRATION OF NAVAJO DAM FOLLOWING A SUBSURFACE NUCLEAR BLAST,
Bureau of Reclamation, Denver, Colo.
George C. Rouse, and Louis H. Roehm.
Bur Reclam Rep No DD-9, July 1969. 30 p, 12 fig, 1 tab, 16 ref.

Descriptors: *Earth dams, Structural behavior, *Nuclear explosions, Instrumentation, Earth movements, Frequency, Earthquakes, Resonance, *Vibrations, Bibliographies, Seismic investigations, *Shock waves, *Earthquake engineering, Seismic waves, *Underground explosions, Seismic studies, Damping.
Identifiers: Gasbuggy Project, Navajo Dam (N Mex), Seismic stability, Dam stability, Seismic velocity, Seismic tests, Dynamic response.

In Dec 1967, the Gasbuggy subsurface nuclear blast was detonated about 24 mi southeast of Navajo Dam, a 400-ft-high Bureau of Reclamation rolled-earth structure in New Mexico. The blast generated measurable seismic vibrations at the dam. In accordance with a Reclamation request, the Coast and Geodetic Survey investigated the response of the dam to these vibrations by recording horizontal and vertical velocities for 3 points on the structure. Measured data obtained for the crest and a point on the downstream slope are compared to computed data for the same locations. (USBR)

PRESTRESSING OF THE LINING OF A HYDROTECHNIC TUNNEL IN A WATERTIGHT ROCK MASS BY GROUTING,
D. Krsmanovic, Z. Langof, and H. Zupcevic.
Rock Mech, Vol 1, No 1, p 71-86, July 1969. 16 p, 9 fig, 1 tab, 6 ref.

Descriptors: Tunnel design, *Tunnel linings, Tunnel pressures, Water tunnels (Conveyance), Tunnels, Pressure conduits, *Pressure tunnels, Hydrostatic pressure, Deformation, *Prestressing, Tensile stress, *Grouting, Foreign design practices, Stress, Water tunnels (Testing), Rock mechanics.
Identifiers: Pressure chamber test, Grout mixes, Yugoslavia, Rama Hydroelec Proj (Yugoslavia), Concrete linings.

The use of grouting to prestress a pressure tunnel lining in a watertight rock mass was investigated with a full-scale test. A 5.0-m-dia by 33-m-long test chamber was set up in a special gallery parallel to the tunnel. The reinforced concrete lining was 50 cm thick. Grouting was applied by a group system grouting 32 boreholes simultaneously. Deformations and stresses in the tunnel lining were measured before, during, and within 2 mo after grouting. The chamber was loaded by internal hydrostatic pressure increased gradually over 11 cycles to a maximum of 13.0 atm. Test results show that prestressing can be achieved satisfactorily by grouting. Tensile stresses developed in the lining at total loadings were very low because of prestressing. (USBR)

CONSOLIDATION AND SEDIMENTATION-COMPRESSION STUDIES OF A CALCAREOUS CORE, EXUMA SOUND, BAHAMAS,
Illinois Univ., Urbana. Dept. of Geology.
Donald G. Miller, and Adrian F. Richards.
Sedimentology, Vol 12, No 3/4, Special Issue, p 301-316, June 1969. 16 p, 4 fig, 1 tab, 36 ref. ONR Contract No 3985 (09).

Descriptors: *Consolidation, *Sediments, *Soil strength, Soil physical properties, Shear, Compressive strength, Cores, Diagenesis, Engineering geology, Carbonate rocks, Particle size.
Identifiers: *Calcareous sediments, *Bahamas.

A comparison is made between the void ratio and pressure relationships resulting from a laboratory consolidation test and a sedimentation-compression computation on a short core of calcareous mud or ooze of low plasticity. Geotechnical measurements of grain size, bulk density, Atterberg limits, water content, vane shear strength, porewater salinity and carbonate content are graphically related to depth in the core. Results of the laboratory consolidation test on this material differ markedly from the in-place relationship between void ratio, or water content, and the effective overburden pressure, or burial depth, shown by the sedimentation-compression curve. The previous maximum consolidation pressure, based on laboratory consolidation test data, is about 60 times greater than the computed in-place effective overburden pressure. An explanation for this difference would include the different magnitudes of time available for consolidation, cementation occurring in-place, and orientation of the constituents. It is suggested that results of the consolidation test on carbonate muds or oozes should be interpreted with caution for geological and engineering purposes. (Knapp-USGS)

RESULTS OF FIELD INVESTIGATIONS OF THE QUALITY OF JOINTING PRECAST ELEMENTS OF SARATOV HYDROELECTRIC POWERPLANT,
E. G. Dmitrieva.
Gidrotekh Stroit, No 4, p 22-23, 1966. Transl from Russ, Bur Reclam Transl 706, Sept 1969. 10 p, 2 fig, 3 ref.

Descriptors: Foreign projects, Precast concrete, Reinforced concrete, Concrete technology, Hydraulic structures, *Joints, Foreign research, *Joint fillers, Methodology, Bonding, Concrete mixes, Concrete placing, Concrete testing, Density, *Field control, Field tests, Watertight, *Quality control, Strength, Vibrators (Mechanical).
Identifiers: USSR, Bond strength, Saratov Powerplant (USSR), Vibratory compaction, Construction methods.

The Saratov combined dam and powerplant on the Volga was built from an experimental design, using precast, reinforced concrete elements. The separate elements are joined by placing and vibrating concrete mix in 60-cm-wide joints. Field tests on these joints showed that, with proper technology and equipment, the bond between the concretes of the element and the joint and the density, strength, and watertightness of joint concrete were satisfactory. However, there were many unsatisfactory joints caused by failure to place all concrete in the joint continuously, failure to meet mix specifications, and poor vibration. The recommended technology, when followed, produced the desired results in vertical joints. Additional grouting was necessary for horizontal joints between the monolithic foundation and elements. Adherence to recommended technology must be required, including composition and transportation of mix, placement rate of 8 to 10 cu m/hr, compaction by specified vibrators, maintaining a 16-cm minimum horizontal joint between elements and foundation slab, and pressurization of mix between components supported by special posts. (USBR)

CONTROLLED CHANGES IN THE PROPERTIES OF CONCRETE AND REINFORCED CONCRETE BY MEANS OF POLYMERS,
S. S. Davydov.
Beton i zhelezobeton, Vol 15, No 5, p 1-3, 1969. Transl from Russ, Bur Reclam Transl 606, Sept 1969. 9 p.

Descriptors: *Concrete technology, *Polymers, *Plastics, Admixtures, Reinforced concrete, Reinforcing, Chemical stability, Aggregates, Hardening, Physical properties, Mechanical properties, *Materials engineering, *Building materials, Cements, Foreign research.
Identifiers: *Concrete-polymer materials, Concrete products, USSR, *Polymer concretes, Epoxy concretes, Plastic coatings.

Soviet institutes involved in advancing structural sciences have developed plastic cements and concretes capable of overcoming the limitations of conventional concretes. For more diversified and larger structures, modern construction requires materials that are strong, flexible, impact- and abrasion-resistant, chemically stable, and unsusceptible to cracking or surface deterioration. By changing the composition and quantity of components, plastic-concretes can be designed to meet specific needs. Soviet research has studied many plastic additives and admixtures for binders and concretes, as well as polymer coatings, laminated structures, and synthetic glues. Polymer concretes from furfural acetate monomers, hardened by benzenesulfonic acid, were studied extensively and are now being used for underground, mining, municipal, industrial, and transport construction. Problems that need resolving to reduce variations in results and costs, and research conducted in this direction are discussed. (USBR)

8G. Materials

DEVELOPMENT AND EVALUATION OF STANDARD TEST METHODS, THE ROLE OF STATISTICAL DESIGN OF EXPERIMENTS,
Purdue Univ., Lafayette, Ind.
Grant Wernimont.
Mater Res Stand, Vol 9, No 9, p 8-20, 64 and 66, Sept 1969. 15 p, 11 fig, 7 tab, 40 ref.

Descriptors: *Materials testing, *Specifications, *Measurement, *Testing, *Statistical methods, Materials engineering, Variability, Quality control, Tolerances (Mechanics), Test procedures, Test specimens, Sampling, Experimental data, Statistical analysis, Statistics, Bibliographies, Control.
Identifiers: *Test results, Experimental design, Experimentation, Statistical quality control, Accuracy.

Specification testing and statistic design of testing experiments were studied by ASTM Committee E-11 on Statistical Methods. Concepts are presented on the ability of a testing process to discriminate materials that conform to specified tolerances from those that do not. Materials sampling and testing operations are discussed. Considerations involved in the design of testing experiments are given for control within a laboratory and among different laboratories. Strategies are suggested for designing, executing, and interpreting experiments to study the variability of materials, to find and control the variations in test results within and among laboratories, and to estimate components of variance for the material being tested. ASTM Committee E-11 believes that statistical design of experiments is important in preparing standards for materials and test procedures but is subordinate to the technology and art of making measurements. The committee, concerned with the general problem of applying statistical methodology, serves as a consultant to other ASTM committees on specific problems. (USBR)

POLARIZATION METHODS FOR MEASURING THE CORROSION OF METALS BURIED UNDERGROUND,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.; and Kaiser Aluminum and Chemical Corp., Spokane, Wash.
D. A. Jones, and T. A. Lowe.
J Mater, Vol 4, No 3, p 600-617, Sept 1969. 18 p, 9 fig, 1 tab, 18 ref.

Descriptors: *Corrosion, *Corrosion control, *Polarization, Aluminum, Testing, Electrochemistry, Steel, Experimental data, Field tests, Test procedures, Measuring instruments, Bridges (Electric), Bibliographies, Polarographic analysis, Electrical resistivity, Metals.
Identifiers: *Underground corrosion, Corrosion environments, Corrosion current, *Corrosion tests, Buried metalwork, Comparative studies.

Corrosion of buried metal equipment cannot be measured easily without removal for inspection. Even then, weight loss tests may be impractical, and visual inspection gives only a qualitative appraisal of corrosion. Electrochemical polarization methods give a numerical value of corrosion rate and can be conducted remotely, leaving the corroding specimen undisturbed. An investigation was made to compare various polarization methods for measuring the corrosion rate of buried metal. The Schwerdtfeger polarization-break method and the Stern polarization-resistance method were compared on buried aluminum and steel. Polarization resistance data are easier to interpret and should be more reliable for comparing corrosion rates calculated by various investigators. In conducting the polarization experiments, ohmic contributions from measured polarization potentials were removed by using the Holler bridge circuit. Relatively low 100-kilo-ohm resistors in the bridge circuit did not appreciably affect calculated corrosion rates, although the resistors did permit polarization of the reference electrode in the circuit. 8H. Rapid Excavation

NUCLEAR EXCAVATION: REVIEW AND ANALYSIS,
L. J. Circei, Jr.
Eng Geol, Vol 3, p 5-59, 1969. 55 p, 25 fig, 4 tab, 88 ref.

Descriptors: *Craters, *Nuclear explosions, *Underground explosions, Excavation, Rock excavation, Nuclear energy, Reviews, Safety, Canals, Radiation hazards, Harbors, Reservoir construction, Panama Canal, Cuts aggregates, Landslides, Bibliographies, Construction.
Identifiers: *Nuclear excavation, *Plowshare Operation, *Rapid excavation, Construction methods.

Nuclear cratering technology has advanced to such a state that meaningful predictions of crater and channel sizes in selected media can be made with confidence. Continuing research is underway to extend basic cratering knowledge to saturated, fine-grained, and stratified media. Significant advances have been made in evaluating the magnitude and extent of safety hazards associated with underground nuclear cratering detonations. Many excavation projects for harbors, reservoirs, canals, and aggregate production are feasible. Nuclear excavation provides a method for alleviating potentially catastrophic situations that could result from floods, landslides, and volcanoes. The development of nuclear excavation into a standard engineering tool will be determined by factors not related entirely to technical feasibility. Political and social pressures will weigh heavily in the ultimate acceptance. (USBR)

MEASURING UNDERGROUND-EXPLOSION EFFECTS ON WATER LEVELS IN SURROUNDING AQUIFERS,
Geological Survey, Denver, Colo.
M. S. Garber, and L. E. Wollitz.
Groundwater, Vol 7, No 4, p 3-7, July-Aug 1969. 5 p, 10 fig, 6 ref.

Descriptors: *Underground explosions, *Aquifers, Groundwater, Effects, Measurement, Water levels, *Water level fluctuations, Water wells, Water table, Wells, Forecasting, *Nuclear explosions, Aquifer characteristics, Transducers, Instrumentation, Oscillographs.
Identifiers: Water-level recorders, Explosive construction, Packings, Plowshare Operation, Pressure transducers.

Underground detonations may produce observable effects in surrounding aquifers and wells. The nature and duration of the effects at any observation point depend on: (1) the amount of energy released by the detonations, (2) the geologic environment, (3) the position of the buried explosive device in relation to the saturated zone, (4) aquifer characteristics, and (5) the distance from point of detonation. Precise measurement of the effects in wells presented numerous technical problems, resulting in the development of specialized techniques. Initially, the effects were observed by measuring the fluctuation of the free water surface in wells; the current technique employs high-resolution pressure transducers deep in the water column. Pneumatic packers may be used to restrict the movement of water into the well. Data are recorded on high-speed oscillographs. (USBR)

BUILDING A COMPUTER-BASED MIS,
Terminal and Display Systems, Inc.
James M. McKeever.
J Syst Manage, Vol 20, No 9, p 12-17, Sept 1969. 6 p, 6 fig.

Descriptors: *Data storage and retrieval, *Data storage systems, *Information retrieval, Data collection systems, Data processing, Technology, Systems analysis, Planning, Methodology, Operations research, Computers, Integration, Management, Decision making, Control, Communication, Requirements.
Identifiers: *Computer-based systems, *Information systems, Systems engineering, Man-machine systems, Data elements.

A computer-based management information system (MIS) cannot be implemented successfully unless an organization concedes that management: (1) has an information problem, (2) wants to solve the problem, and (3) is willing to commit the resources for a solution. Five basic steps in designing an MIS are: (1) understanding and approving the objectives of the system by top management, (2) determining information requirements, (3) designing a data base, (4) designing or acquisitioning software, and (5) selecting new or modifying existing hardware. The 5 steps should be performed in the order listed, although there will be some overlap and parallel activity. An MIS must not remain static. The best examples of management information systems show that new data files should be added to the system, old data files no longer used should be removed from the system, and the contents of remaining data files should be changed frequently to reflect the information needs of management. These needs will come to light only after management has had experience using the system. (USBR)

CARBONATE ROCKS
DIAGENETIC RE-CRYSTALLIZATION AND ORIENTATION OF TWO CARBONATE SPECIES,
W70-03285 02J

SUBAERIAL CEMENTATION AND SUBSEQUENT DOLOMITIZATION OF LACUSTRINE CARBONATE MUDS AND SANDS FROM PALEO-TUZ GOLU ('SALT LAKE'), TURKEY,
W70-03446 02J

STRUCTURAL AND TEXTURAL EVIDENCE OF EARLY LITHIFICATION IN FINE-GRAINED CARBONATE ROCKS,
W70-03447 02J

THE EFFECT OF FRESH WATER ON THE REDISTRIBUTION OF URANIUM IN CARBONATE SEDIMENTS,
W70-03468 02K

CARBONATES
CALCIUM IN SOLUTION IN THE LAKE WATERS OF JAPAN,
W70-03316 02H

CARDIGAN BAY(WALES)
RECENT SEDIMENTATION IN NORTHERN CARDIGAN BAY, WALES,
W70-03478 02L

CARP
UPTAKE AND RETENTION OF MALATHION BY THE CARP,
W70-03516 05C

CATALOG OF INFORMATION ON WATER DATA
CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO WATER QUALITY STATIONS,
W70-03473 07C

CATHODIC PROTECTION
THE ELECTROCHEMICAL METHODS OF PROTECTING HYDROTURBINES AGAINST CAVITATION EROSION,
W70-03366 08C

CAUSEWAYS
WATERS AND WATERCOURSES CRIMINAL OFFENSES.
W70-03597 06E

CAVITATION
THE ELECTROCHEMICAL METHODS OF PROTECTING HYDROTURBINES AGAINST CAVITATION EROSION,
W70-03366 08C

CEDAR RAPIDS
THE ROLE OF OPEN SPACES IN FLOOD PLAIN MANAGEMENT,
W70-03342 06F

CHANNEL IMPROVEMENT
VACATION OR RELOCATION OF WATERCOURSES - CONSTRUCTION OF DAMS.
W70-03521 04A

CHANNEL MORPHOLOGY
LONGITUDINAL SLOPE CHARACTERISTICS OF RIVERS OF THE MIDCONTINENT AND THE ATLANTIC EAST GULF SLOPES,
W70-03255 02E

CHAOBORIDAE
ECOLOGY OF CHIRONOMIDAE, CHAOBORIDAE, AND OTHER BENTHOS IN FOURTEEN WISCONSIN LAKES,
W70-03333 02H

CHEMICAL REACTIONS
OXYGENATION OF FERROUS IRON THE RATE-DETERMINING STEP IN THE FORMATION OF ACIDIC MINE DRAINAGE,
W70-03434 05B

CHEMISTRY
EFFECTS OF ENDRIN ON BLOOD AND TISSUE CHEMISTRY OF A MARINE FISH,
W70-03314 05C

CHICAGO
THE ISSUE OF THE LAKEFRONT, AN HISTORICAL CRITICAL SURVEY,
W70-03338 06B

CHINOOK SALMON
EFFECTS OF TEMPERATURE UPON THE FORMATION OF VERTEBRAE AND FIN RAYS IN YOUNG CHINOOK SALMON,
W70-03557 05C

CHIRONOMIDA
CHIRONOMIDA AND THE STUDY OF LAKE TYPES,
W70-03332 02H

CHIRONOMIDAE
ECOLOGY OF CHIRONOMIDAE, CHAOBORIDAE, AND OTHER BENTHOS IN FOURTEEN WISCONSIN LAKES,
W70-03333 02H

CHLORINATED HYDROCARBON PESTICIDES
SURVIVAL OF FISH IN 164 HERBICIDES, INSECTICIDES, FUNGICIDES, WETTING AGENTS AND MISCELLANEOUS SUBSTANCES,
W70-03623 05C

CHLORINATED HYDROCARBONS
A WATER MONITORING SYSTEM FOR PESTICIDES IN NORTH CAROLINA,
W70-03437 05B

CHROMIUM
RESPONSE OF THE INTERRENAL GLAND OF RAINBOW TROUT (SALMO GAIRDNERI) TO STRESS,
W70-03527 05C

CITIES
WATER RESERVOIR SYSTEMS.
W70-03435 04A

VACATION OR RELOCATION OF WATERCOURSES - CONSTRUCTION OF DAMS.
W70-03521 04A

BRIDGES AND VIADUCTS.
W70-03533 04A

AUTHORITY OF CITIES TO DEVELOP SEWAGE SYSTEMS, AND TO IMPROVE LAKES AND WATERCOURSES.
W70-03534 05G

MUNICIPAL CORPORATIONS (PUBLIC SERVICES).
W70-03579 06E

CLAY MINERALS
DIAGENETIC RE-CRYSTALLIZATION AND ORIENTATION OF TWO CARBONATE SPECIES,
W70-03285 02J

CLAYS
NONIONIC POLYMER FLOCCULATION OF DILUTE CLAY SUSPENSION,
W70-03265 05A

CLEANING
CLEANING OIL CONTAMINATED BEACHES WITH CHEMICALS, A STUDY OF THE EFFECTS OF CLEANING OIL CONTAMINATED BEACHES WITH CHEMICAL DISPERSANTS.
W70-03349 05C

CLEANING OUR ENVIRONMENT--THE CHEMICAL BASIS FOR ACTION.
W70-03364 05G

CLIMATOLOGY
A MICROCLIMATIC PROFILE BETWEEN THE SNAKE RIVER CANYON AND CLEARWATER MOUNTAINS, IDAHO,
W70-03645 02B

CLOGGING
TILE CLOGGING BY IRON AND MANGANESE IN IMPERIAL VALLEY, CALIFORNIA,
W70-03357 04A

CLOSED CONDUIT FLOW
COMPARISON OF COMPUTED AND OBSERVED FLOOD ROUTING IN A CIRCULAR CROSS-SECTION,
W70-03295 02E

COASTAL AQUIFER
FLOW OF FRESH WATER TO DRAINS IN A COASTAL AQUIFER,
W70-03257 04B

COASTAL STRUCTURES
WHARVES, DOCKS AND FERRIES.
W70-03570 06E

COLLECTING HYDROLOGIC DATA
THE EFFECTIVENESS OF COLLECTING HYDROLOGIC DATA AT MAYNARD CREEK WATERSHED VIA A DATA ACQUISITION SYSTEM,
W70-03615 07A

COLOMBIA
RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART B. MOVEMENT OF MESOSCALE SYSTEMS IN COLOMBIA,
W70-03481 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART C. DAILY RAINFALL IN INTERIOR COLOMBIA,
W70-03482 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART H. AN ANALYSIS OF THE DISTRIBUTION OF RAINFALL AND SOME RAINFALL ASSOCIATIONS FOR SELECTED STATIONS IN WESTERN COLOMBIA,
W70-03486 02B

COLUMBIA RIVER
THE RETURN OF THE BLUEBACK SALMON TO THE COLUMBIA RIVER,
W70-03546 05C

COMMERCIAL FISHING
FISH TRAPS LICENSING AND REGULATION.
W70-03638 06E

COMMUNICATION
TELEGRAPH AND TELEPHONES.
W70-03427 06E

COMPENSATION
DRIFTING AND FLOATING TIMBER.
W70-03426 06E

ACQUISITION OF LAND TO PREVENT CONTAMINATION.
W70-03532 05G

COMPUTER PROGRAMS
ECONOMIC EVALUATION OF WATER QUALITY, FINAL REPORT,
W70-03428 05G

COMPUTER-BASED SYSTEMS
BUILDING A COMPUTER-BASED MIS,
W70-03360 10

CONCRETE TECHNOLOGY
CONTROLLED CHANGES IN THE PROPERTIES OF CONCRETE AND REINFORCED CONCRETE BY MEANS OF POLYMERS,
W70-03372 08F

CONCRETE-POLYMER MATERIALS
CONTROLLED CHANGES IN THE PROPERTIES OF CONCRETE AND REINFORCED CONCRETE BY MEANS OF POLYMERS,
W70-03372 08F

CONCURRENT JURISDICTION
JURISDICTION OVER BOUNDARY WATERS.
W70-03601 06E

CONDEMNATION
THE FEDERAL VIEW OF DAMAGES AND BENEFITS,
W70-03361 06E

ACQUISITION OF LAND TO PREVENT CONTAMINATION.
W70-03532 05G

WATER AND WATERWORKS COMPANIES.
W70-03587 06E

CONDUITS
WATERS AND WATERCOURSES CRIMINAL OFFENSES.
W70-03596 06E

CONFERENCES
ENVIRONMENTAL LAW CONFERENCE PROPOSES NATIONAL LEGAL ACTION-INFORMATION CENTER.
W70-03379 05G

CONSERVANCY DISTRICTS
CONSERVANCY DISTRICTS (WATER QUALITY MANAGEMENT AND PROTECTION).
W70-03644 05G

CONSERVATION
ENVIRONMENTAL LAW CONFERENCE PROPOSES NATIONAL LEGAL ACTION-INFORMATION CENTER.
W70-03379 05G

WATER SUPPLY - SANITATION - DITCHES (ORGANIZATION AND PURPOSES OF CONSERVANCY DISTRICTS).
W70-03643 04A

CONSOLIDATION
CONSOLIDATION AND SEDIMENTATION-COMPRESSION STUDIES OF A CALCAREOUS CORE, EXUMA SOUND, BAHAMAS,
W70-03448 08E

CONTAMINANTS
ASSESSING OUTDOOR INSULATION,
W70-03368 08C

CONTAMINATION
ASSESSING OUTDOOR INSULATION,
W70-03368 08C

CONTINENTAL SHELF
A UNITED STATES POLICY FOR THE WET FRONTIER,
W70-03627 06E

CONTINENTAL SLOPE
A UNITED STATES POLICY FOR THE WET FRONTIER,

W70-03627 06E

CONVECTION
EXPERIMENTS ON HALINE CONVECTION INDUCED BY THE FREEZING OF SEA WATER,
W70-03464 02C

COOLING
COMPARATIVE HYDROCHEMICAL CHARACTERISTIC OF RESERVOIRS - COOLERS OF STATE REGIONAL ELECTRIC POWER (HEAT) STATIONS OF THE UKRAINE (IN RUSSIAN),
W70-03539 05C

THERMAL-HYDRAULIC STUDY - ARKANSAS COOLING RESERVOIR,
W70-03542 05D

COOLING WATER
EFFECT OF ORGANIC WASTE AND COOLING WATER ON SELF-PURIFICATION OF WATERS,
W70-03547 05C

WATER SUPPLY TO THERMAL POWER PLANTS,
W70-03548 03E

COOSA RIVER
THE EFFECTS OF IMPOUNDING RESERVOIRS ON RIVER WASTE ASSIMILATIVE CAPACITY,
W70-03550 05C

CORES
A NON-DESTRUCTIVE CORE ANALYSIS TECHNIQUE USING X-RAYS,
W70-03470 07B

CORRELATION ANALYSIS
REDUCTION OF SERIALLY CORRELATED HYDROLOGIC DATA,
W70-03263 07C

RELATION OF DISCHARGE AND STREAM LENGTH IN EASTERN UNITED STATES,
W70-03487 02E

STOCHASTIC DESCRIPTION OF DAILY RIVER FLOWS,
W70-03497 02E

CORROSION
POLARIZATION METHODS FOR MEASURING THE CORROSION OF METALS BURIED UNDERGROUND,
W70-03365 08G

CORROSION CONTROL
POLARIZATION METHODS FOR MEASURING THE CORROSION OF METALS BURIED UNDERGROUND,
W70-03365 08G

CORROSION TESTS
POLARIZATION METHODS FOR MEASURING THE CORROSION OF METALS BURIED UNDERGROUND,
W70-03365 08G

COST ANALYSIS
REVIEW AND ANALYSIS OF THE COSTS OF DESALTED SEA WATER,
W70-03453 03A

COST PER UNIT PRODUCT
COST HANDBOOK FOR INDUSTRIAL WATER USES,
W70-03432 06C

CRATERS
NUCLEAR EXCAVATION REVIEW AND ANALYSIS,
W70-03362 08H

CULTURES
EFFECT OF SURFACE/VOLUME RELATIONSHIP, CO-SUB-2 ADDITION, AERATION, AND MIXING ON NITRATE UTILIZATION BY SCENEDESMUS CULTURES IN SUBSURFACE AGRICULTURAL WASTE WATERS,
W70-03334 05D

CURRENT METERS
GREAT LAKES NEARSHORE MODELLING FROM CURRENT METER DATA,
W70-03253 05B

ON THE STRUCTURE OF HIGH-FREQUENCY TURBULENCE IN A TIDAL ESTUARY,
W70-03259 02L

CURRENTS(WATER)
GREAT LAKES NEARSHORE MODELLING FROM CURRENT METER DATA,
W70-03253 05B

NEPHELOID LAYERS AND BOTTOM CURRENTS IN THE ARCTIC OCEAN,
W70-03463 02L

CYANOPHYTA
CONTROL OF BLUE-GREEN ALGAE BLOOMS WITH 2,3-DICHLORONAPHTHOQUINONE,
W70-03310 05G

DAM CONSTRUCTION
DAMS, MILLS AND ELECTRIC POWER.
W70-03609 04A

DAMS AND BRIDGES (PROCEDURES REGARDING WATER POWER PERMITS).
W70-03640 06E

DAMAGES
THE FEDERAL VIEW OF DAMAGES AND BENEFITS,
W70-03361 06E

ESTABLISHMENT OF DRAINAGE AND LEVEE DISTRICTS.
W70-03583 04A

DAMS
VACATION OR RELOCATION OF WATERCOURSES - CONSTRUCTION OF DAMS.
W70-03521 04A

PUBLIC UTILITIES AND CARRIERS.
W70-03586 06E

DAMS, MILLS AND ELECTRIC POWER.
W70-03609 04A

PUBLIC DOMAIN AND TRUST FUNDS (DAMS AND BRIDGES).
W70-03641 06E

DATA COLLECTIONS
QUALITY OF SURFACE WATERS OF SOUTH CAROLINA A SUMMARY OF DATA, 1945-1968,
W70-03266 05B

RECORDS OF WATER-LEVEL MEASUREMENTS IN OBSERVATION WELLS IN HARRIS COUNTY, TEXAS,
W70-03459 02F

CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO WATER QUALITY STATIONS,
W70-03473 07C

CATALOG OF TSUNAMIS IN THE HAWAIIAN ISLANDS,
W70-03476 02L

THE EFFECTIVENESS OF COLLECTING HYDROLOGIC DATA AT MAYNARD CREEK WATERSHED VIA A DATA ACQUISITION SYSTEM,
W70-03615 07A

DATA PROCESSING
REDUCTION OF SERIALLY CORRELATED HYDROLOGIC DATA,
W70-03263 07C

DATA STORAGE AND RETRIEVAL
BUILDING A COMPUTER-BASED MIS,
W70-03360 10

CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO WATER QUALITY STATIONS,
W70-03473 07C

DATA STORAGE SYSTEMS
BUILDING A COMPUTER-BASED MIS,
W70-03360 10

DATA TRANSMISSION
THE EFFECTIVENESS OF COLLECTING HYDROLOGIC DATA AT MAYNARD CREEK WATERSHED VIA A DATA ACQUISITION SYSTEM,
W70-03615 07A

DEGRADATION
THE TOXICITY OF THE HYDROLYSIS AND BREAKDOWN PRODUCTS OF MALATHION TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS, RAFINESQUE),
W70-03518 05C

DELAWARE RIVER
WATER QUALITY IN THE DRAINAGE AREA OF THE DELAWARE RIVER (DUTCH),
W70-03269 05B

DELAWARE RIVER PORT AUTHORITY (JOINT COMPACT WITH NEW JERSEY).
W70-03572 06E

DELAWARE RIVER PORT AUTHORITY (PURPOSES).
W70-03573 06E

DELAWARE RIVER PORT AUTHORITY (REVENUE).
W70-03574 06E

SHAD FISHING IN THE DELAWARE RIVER, BAY, AND TRIBUTARIES.
W70-03639 06E

DELAWARE RIVER BASIN
WATER QUALITY IN THE DRAINAGE AREA OF THE DELAWARE RIVER (DUTCH),
W70-03269 05B

DELAWARE RIVER BASIN COMMISSION
WATER QUALITY IN THE DRAINAGE AREA OF THE DELAWARE RIVER (DUTCH),
W70-03269 05B

DELTAS
GEOLOGICAL AND MINERALOGICAL STUDIES OF SOME SAND DEPOSITS IN THE NILE DELTA, U.A.R.,
W70-03469 02L

DENSITY CURRENTS
EXPERIMENTS ON HALINE CONVECTION INDUCED BY THE FREEZING OF SEA WATER,
W70-03464 02C

STREAMFLOW EFFECTS IN A STRATIFIED MODEL RESERVOIR,
W70-03543 08B

DEPOSITION(SEDIMENTS)
VISUAL OBSERVATIONS OF MANGANESE DEPOSITS ON THE BLAKE PLATEAU,
W70-03462 02J

DESALINATION PLANTS
REVIEW AND ANALYSIS OF THE COSTS OF DESALTED SEA WATER,
W70-03453 03A

DETERGENTS
THE EFFECTS OF OIL-SPILL REMOVERS ('DETERGENTS') ON THE GASTROPOD NUCELLA LAPILLUS ON A ROCKY SHORE AND IN THE LABORATORY,
W70-03513 05C

BIODEGRADABLE DETERGENTS RECENT PROBLEMS AND PROGRESS.
W70-03530 05D

DEUTERIUM
VARIATION IN THE MEAN DEUTERIUM CONTENT OF PRECIPITATIONS IN ANTARCTICA,
W70-03461 02C

DIAGENESIS
DIAGENETIC RE-CRYSTALLIZATION AND ORIENTATION OF TWO CARBONATE SPECIES,
W70-03285 02J

STRUCTURAL AND TEXTURAL EVIDENCE OF EARLY LITHIFICATION IN FINE-GRAINED CARBONATE ROCKS,
W70-03447 02J

THE EFFECT OF FRESH WATER ON THE REDISTRIBUTION OF URANIUM IN CARBONATE SEDIMENTS,
W70-03468 02K

IRON-RICH LAYERS IN SEDIMENTS FROM THE GULF OF MEXICO,
W70-03471 02J

DIATOMS
A LABORATORY METHOD FOR THE STUDY OF MARINE BENTHIC DIATOMS,
W70-03325 05C

DIFFUSION
JET DIFFUSION, REVIEW OF MODEL TESTING AND COMPARISON WITH THEORY,
W70-03555 08B

DIGITAL SIGNALS
THE EFFECTIVENESS OF COLLECTING HYDROLOGIC DATA AT MAYNARD CREEK WATERSHED VIA A DATA ACQUISITION SYSTEM,
W70-03615 07A

DIMENSIONAL ANALYSIS
FLOW OF FRESH WATER TO DRAINS IN A COASTAL AQUIFER,
W70-03257 04B

DISCHARGE MEASUREMENT
MEAN STREAMFLOW FROM DISCHARGE MEASUREMENTS,
W70-03280 02E

DISPERSION
GREAT LAKES NEARSHORE MODELLING FROM CURRENT METER DATA,
W70-03253 05B

BRANCHING-TYPE MODELS OF FLOW THROUGH POROUS MEDIA,
W70-03262 02F

DISSOLVED OXYGEN
AERATION OF STREAMS WITH AIR AND MOLECULAR OXYGEN,
W70-03625 05G

DISSOLVED SULPHATE
DETERMINATION OF MICROGRAMME QUANTITIES OF DISSOLVED SULPHATE IN SURFACE WATERS, SOILS AND PLANTS,
W70-03502 05A

DITCHES
WATER SUPPLY - SANITATION - DITCHES (DRAINAGE IMPROVEMENTS).
W70-03402 04A

WATER SUPPLY - SANITATION - DITCHES (INTERSTATE COUNTY DITCHES).
W70-03403 04A

WATER SUPPLY--SANITATION--DITCHES.
W70-03404 04A

ESTABLISHMENT OF DRAINAGE DISTRICTS BY MUTUAL CONSENT.
W70-03419 04A

BRIDGES AND CROSSINGS.
W70-03605 06E

DIURESIS
THE DIURETIC RESPONSE BY RAINBOW TROUT TO SUB-LETHAL CONCENTRATIONS OF AMMONIA,
W70-03524 05C

DIURNAL OXYGEN CURVES
ALGAL GROWTH AND PRIMARY PRODUCTIVITY IN A THERMAL STREAM,
W70-03309 05C

DIVERSION
WALLACE V SCHNEIDER (SURFACE DRAINAGE).
W70-03321 04A

PAYMENTS TO STATE FOR WATERS DIVERTED.
W70-03517 06D

DOCKS
WHARVES, DOCKS AND FERRIES.
W70-03570 06E

DOCUMENTATION
CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO WATER QUALITY STATIONS,
W70-03473 07C

DOLOMITE
SUBAERIAL CEMENTATION AND SUBSEQUENT DOLOMITIZATION OF LACUSTRINE CARBONATE MUDS AND SANDS FROM PALEO-TUZ GOLU ('SALT LAKE'), TURKEY,
W70-03446 02J

DOMESTIC WASTES
AN INDUSTRIAL WASTE GUIDE TO THE WOOL PROCESSING INDUSTRY.
W70-03531 05D

HEALTH WATER, SEWAGE, GARBAGE (PAWLEY'S ISLAND, GREENVILLE COUNTY, SPARTENBURG COUNTY, AIKEN COUNTY).
W70-03632 05F

DOMESTIC WATER
DETERMINATION OF DOMESTIC WATER CONSUMPTION RATES UNDER VARYING WATER PRESSURES,
W70-03247 06D

ACQUISITION OF LAND TO PREVENT CONTAMINATION.
W70-03532 05G

DRAGENESIS
SUBAERIAL CEMENTATION AND SUBSEQUENT DOLOMITIZATION OF LACUSTRINE CARBONATE MUDS AND SANDS FROM PALEO-TUZ GOLU ('SALT LAKE'), TURKEY,
W70-03446 02J

DRAIN TILES
TILE CLOGGING BY IRON AND MANGANESE IN IMPERIAL VALLEY, CALIFORNIA,
W70-03357 04A

DRAINAGE
ACTUAL EVAPOTRANSPIRATION AS DETERMINED FROM SOIL-WATER AND CANOPY CHARACTERISTICS AND POTENTIAL EVAPOTRANSPIRATION,
W70-03449 02D

THE RECOVERY OF THE INFILTRATION CAPACITY AFTER DRAINAGE,
W70-03495 02G

DRAINAGE SUBDISTRICTS.

CONSERVANCY DISTRICTS (WATER QUALITY MANAGEMENT AND PROTECTION).
W70-03644 05G

OHIO RIVER
LONGITUDINAL SLOPE CHARACTERISTICS OF RIVERS OF THE MIDCONTINENT AND THE ATLANTIC EAST GULF SLOPES,
W70-03255 02E

BRIDGE COMPANIES.
W70-03409 06E

OHIO VALLEY SANITATION COMPACT.
W70-03415 05G

OIL WASTES
CLEANING OIL CONTAMINATED BEACHES WITH CHEMICALS, A STUDY OF THE EFFECTS OF CLEANING OIL CONTAMINATED BEACHES WITH CHEMICAL DISPERSANTS.
W70-03349 05C

OIL WELLS
OIL AND GAS.
W70-03425 08G

OILY WATER
THE EFFECTS OF OIL-SPILL REMOVERS ('DETERGENTS') ON THE GASTROPOD NUCELLA LAPILLUS ON A ROCKY SHORE AND IN THE LABORATORY,
W70-03513 05C

OPEN CHANNEL FLOW
UNIVERSAL FORMULA FOR UNIFORM FLOW,
W70-03248 08B

OPEN SPACE
THE ROLE OF OPEN SPACES IN FLOOD PLAIN MANAGEMENT,
W70-03342 06F

OPERATING COSTS
MATHEMATICAL MODEL OF SEWAGE SLUDGE FLUIDIZED BED INCINERATOR CAPACITIES AND COSTS,
W70-03610 05G

OPTICAL PROPERTIES
NEPHELOID LAYERS AND BOTTOM CURRENTS IN THE ARCTIC OCEAN,
W70-03463 02L

OPTIMIZATION
OPTIMIZATION OF STEP AERATION WASTE TREATMENT SYSTEMS,
W70-03614 05D

ORGANIC LOADING
EFFECT OF ORGANIC WASTE AND COOLING WATER ON SELF-PURIFICATION OF WATERS,
W70-03547 05C

ORGANIC MATTER
FACTORS INFLUENCING PHOTOSYNTHESIS AND EXCRETION OF DISSOLVED ORGANIC MATTER BY AQUATIC MACROPHYTES IN HARD-WATER LAKES,
W70-03307 02H

DISSOLVED ORGANIC MATTER IN AN ANOXIC FJORD, WITH SPECIAL REFERENCE TO THE PRESENCE OF MERCAPTANS,

W70-03503 05B

ORGANIZATIONAL ARRANGEMENTS
ANALYSIS OF MANAGERIAL, FINANCIAL, AND REGULATORY FUNCTIONS OF REGIONAL WATER RESOURCES AUTHORITIES AND OTHER INSTITUTIONAL ARRANGEMENTS.
W70-03611 06B

ORGANOPHOSPHORUS PESTICIDES
SURVIVAL OF FISH IN 164 HERBICIDES, INSECTICIDES, FUNGICIDES, WETTING AGENTS AND MISCELLANEOUS SUBSTANCES,
W70-03623 05C

ORIFICES
MECHANICS OF STRATIFIED FLOW THROUGH ORIFICES,
W70-03544 08B

OUTLETS
JET DIFFUSION, REVIEW OF MODEL TESTING AND COMPARISON WITH THEORY,
W70-03555 08B

OVERLAND FLOW
THE MECHANISM OF DIRECT SURFACE RUNOFF FROM RAINFALL,
W70-03475 02E

THE SIMULATION OF INFILTRATION FOR STUDIES IN OVERLAND FLOW,
W70-03492 02A

OWNERSHIP OF BEDS
ARE WE LOSING OUR LAKES,
W70-03382 06E

ARE WE LOSING OUR LAKES (STATE'S ACQUISITION OF TITLE UPON ADMISSION TO THE UNION),
W70-03383 06E

ARE WE LOSING OUR LAKES. (STATE'S ACQUISITION OF TITLE THROUGH CONSTRUCTION OF FEDERAL PATENTS ACCORDING TO LOCAL LAW),
W70-03384 06E

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA,
W70-03386 06E

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA (SOVEREIGN OWNERSHIP AND INALIENABILITY I),
W70-03387 06E

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA (SOVEREIGN OWNERSHIP AND INALIENABILITY II),
W70-03388 06E

OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA (CHANGING SHORELINES),
W70-03389 06E

OXIDATION
OXYGENATION OF FERROUS IRON THE RATE-DETERMINING STEP IN THE FORMATION OF ACIDIC MINE DRAINAGE,
W70-03434 05B

OXYGEN
AERATION OF STREAMS WITH AIR AND MOLECULAR OXYGEN,
W70-03625 05G

OXYGENATION
DISSOLVED ORGANIC MATTER IN AN ANOXIC FJORD, WITH SPECIAL REFERENCE TO THE PRESENCE OF MERCAPTANS,
W70-03503 05B

PALEOHYDROLOGY
PALEOHYDROLOGY APPLICATION OF MODERN HYDROLOGIC DATA TO PROBLEMS OF THE ANCIENT PAST,
W70-03490 02A

PARENT STREAM THEORY
THE RETURN OF THE BLUEBACK SALMON TO THE COLUMBIA RIVER,
W70-03546 05C

PARKS
THE ROLE OF OPEN SPACES IN FLOOD PLAIN MANAGEMENT,
W70-03342 06F

PARTICLE SHAPE
AN OPTICAL METHOD OF MEASURING GRAIN ORIENTATION IN SEDIMENTS,
W70-03282 02J

WEATHERING AND ROUNDNESS OF QUARTZ SAND GRAINS,
W70-03283 02J

PARTICLE SIZE
PARTICLE SHAPE AND INFERENCE OF SIZE FROM SIEVING,
W70-03287 02J

PARTICULATE FRACTIONS
PARTICULATE FRACTIONS IN WATER AND THE RELATIONSHIP TO AQUATIC MICROFLORA,
W70-03505 05B

PASSAGE OF WATER
REMOVAL OF MILLDAMS.
W70-03576 06E

PEAK POWER
ENERGY REQUIREMENT AND ITS ROLE IN THE PAST, PRESENT, AND FUTURE DEVELOPMENT OF GRAND COULEE DAM,
W70-03358 08C

PENALTIES(CIVIL)
PUBLIC MILLS (FREE PASSAGE OF WATER THROUGH MILL SLUICES).
W70-03592 04A

PENALTIES(CRIMINAL)
HEALTH WATER, SEWAGE, GARBAGE.
W70-03629 05F

HEALTH WATER, SEWAGE, GARBAGE (WATER SUPPLIES - WATER SUPPLY OF GREENVILLE).
W70-03630 05F

PENNSYLVANIA
EXTENT AND FREQUENCY OF INUNDATION ON THE PERKIOMEN CREEK FLOOD PLAIN FROM GREEN LANE RESERVOIR TO THE SCHUYLKILL RIVER (NEAR OAKS, PENNSYLVANIA),
W70-03458 02E

VACATION OR RELOCATION OF WATERCOURSES - CONSTRUCTION OF DAMS.
W70-03521 04A

FLOOD CONTROL.
W70-03529 04A

ACQUISITION OF LAND TO PREVENT CONTAMINATION.
W70-03532 05G

BRIDGES AND VIADUCTS.
W70-03533 04A

WHARVES, DOCKS AND FERRIES.
W70-03570 06E

TURNPIKE BRIDGE ACROSS THE DELAWARE RIVER.
W70-03571 06E

DELAWARE RIVER PORT AUTHORITY (JOINT COMPACT WITH NEW JERSEY).
W70-03572 06E

DELAWARE RIVER PORT AUTHORITY (PURPOSES).
W70-03573 06E

DELAWARE RIVER PORT AUTHORITY (REVENUE).
W70-03574 06E

SHAD FISHING IN THE DELAWARE RIVER, BAY, AND TRIBUTARIES.
W70-03639 06E

PERIPHYTON
LABORATORY STUDIES OF PERIPHYTON PRODUCTION AND COMMUNITY METABOLISM IN LOTIC ENVIRONMENTS,
W70-03327 05C

PERKIOMEN CREEK
EXTENT AND FREQUENCY OF INUNDATION ON THE PERKIOMEN CREEK FLOOD PLAIN FROM GREEN LANE RESERVOIR TO THE SCHUYLKILL RIVER (NEAR OAKS, PENNSYLVANIA),
W70-03458 02E

PERMEABLE BEDS
THE EFFECT OF A PERMEABLE SAND BED ON SEDIMENT MOTION,
W70-03617 02J

PERMITS
COUNTY WATER SUPPLY SYSTEMS.
W70-03396 04A

SHAD FISHING IN THE DELAWARE RIVER, BAY, AND TRIBUTARIES.
W70-03639 06E

DAMS AND BRIDGES (PROCEDURES REGARDING WATER POWER PERMITS).
W70-03640 06E

PUBLIC DOMAIN AND TRUST FUNDS (DAMS AND BRIDGES).
W70-03641 06E

PESTICIDE KINETICS
POSSIBILITIES FOR MINERALIZATION OF PESTICIDES (DUTCH),
W70-03271 05G

PESTICIDE MONITORING
A WATER MONITORING SYSTEM FOR PESTICIDES IN NORTH CARCLINA,
W70-03437 05B

PESTICIDE REMOVAL
BIOLOGICAL CONCENTRATION OF PESTICIDES BY ALGAE,
W70-03520 05C

ACCUMULATION OF DIELDRIN BY FISH AND SELECTED FISH-FOOD ORGANISMS,
W70-03525 05C

PESTICIDE RESIDUES
POSSIBILITIES FOR MINERALIZATION OF PESTICIDES (DUTCH),
W70-03271 05G

A WATER MONITORING SYSTEM FOR PESTICIDES IN NORTH CAROLINA,
W70-03437 05B

UPTAKE AND RETENTION OF MALATHION BY THE CARP,
W70-03516 05C

ACCUMULATION OF DIELDRIN BY FISH AND SELECTED FISH-FOOD ORGANISMS,
W70-03525 05C

PESTICIDE TOXICITY
REPRODUCTION IN BROOK TROUT (SALVELINUS FONTINALIS) FED SUBLETHAL CONCENTRATIONS OF DDT,

W70-03515 05C

BIOLOGICAL CONCENTRATION OF PESTICIDES BY ALGAE,
W70-03520 05C

THE EFFECTS OF TEMPERATURE ON THE SUSCEPTIBILITY OF BLUEGILLS AND RAINBOW TROUT TO SELECTED PESTICIDES,
W70-03526 05C

PESTICIDES
A WATER MONITORING SYSTEM FOR PESTICIDES IN NORTH CAROLINA,
W70-03437 05B

A NEW POLLUTION PROBLEM,
W70-03456 05B

PETROFABRICS
AN OPTICAL METHOD OF MEASURING GRAIN ORIENTATION IN SEDIMENTS,
W70-03282 02J

DIAGENETIC RE-CRYSTALLIZATION AND ORIENTATION OF TWO CARBONATE SPECIES,
W70-03285 02J

PHENOXY ACETATES
A WATER MONITORING SYSTEM FOR PESTICIDES IN NORTH CAROLINA,
W70-03437 05B

PHOSPHATES
A COMPREHENSIVE APPROACH TO THE MANAGEMENT OF PHOSPHATES,
W70-03346 05D

EVALUATION OF OPERATING PARAMETERS OF ALUMINA COLUMNS FOR THE SELECTIVE REMOVAL OF PHOSPHORUS FROM WASTEWATERS AND THE ULTIMATE DISPOSAL OF PHOSPHORUS AS CALCIUM PHOSPHATE,
W70-03612 05D

PHOSPHORUS
THE DISTRIBUTION OF AMMONIA, NITRATES, NITRITES, AND PHOSPHATES IN LAKE CONSTANCE (OBERSEE) IN APRIL 1964 (IN GERMAN),
W70-03318 02H

MEASUREMENT OF PHOSPHORUS IN WASTEWATER,
W70-03331 05A

PHOTOSYNTHESIS
FACTORS INFLUENCING PHOTOSYNTHESIS AND EXCRETION OF DISSOLVED ORGANIC MATTER BY AQUATIC MACROPHYTES IN HARD-WATER LAKES,

RAIN GAGES
A RAINFALL RATE SENSOR,
W70-03363 07B

RAINBOW TROUT
SOME FACTORS INFLUENCING SUSCEPTIBILITY OF RAINBOW TROUT TO THE ACUTE TOXICITY OF AN ETHYL MERCURY PHOSPHATE FORMULATION (TIMSAN),
W70-03523 05C

AN EFFECT OF WATER HARDNESS IN THE THERMAL RESISTANCE OF THE RAINBOW TROUT, SALMO GAIRDNERII RICHARDSON,
W70-03554 05C

RAINFALL
A RAINFALL RATE SENSOR,
W70-03363 07B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS,
W70-03479 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART A. RAINFALL PATTERNS IN GUAYANA AND SURINAM,
W70-03480 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART B. MOVEMENT OF MESOSCALE SYSTEMS IN COLOMBIA,
W70-03481 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART C. DAILY RAINFALL IN INTERIOR COLOMBIA,
W70-03482 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART D. NORMALITY OF RAINFALL DISTRIBUTIONS,
W70-03483 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART E. EXTREME VALUE ANALYSIS IN VENEZUELA,
W70-03484 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART F. TRENDS IN THE RAINFALL,
W70-03485 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART H. AN ANALYSIS OF THE DISTRIBUTION OF RAINFALL AND SOME RAINFALL ASSOCIATIONS FOR SELECTED STATIONS IN WESTERN COLOMBIA,
W70-03486 02B

RAINFALL DISPOSITION
A PARTICULAR STOCHASTIC PROCESS AS APPLIED TO HYDROLOGY,
W70-03301 02A

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS,
W70-03479 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART A. RAINFALL PATTERNS IN GUAYANA AND SURINAM,
W70-03480 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART B. MOVEMENT OF MESOSCALE SYSTEMS IN COLOMBIA,
W70-03481 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART C. DAILY RAINFALL IN INTERIOR COLOMBIA,
W70-03482 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART D. NORMALITY OF RAINFALL DISTRIBUTIONS,
W70-03483 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART E. EXTREME VALUE ANALYSIS IN VENEZUELA,
W70-03484 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART F. TRENDS IN THE RAINFALL,
W70-03485 02B

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS PART H. AN ANALYSIS OF THE DISTRIBUTION OF RAINFALL AND SOME RAINFALL ASSOCIATIONS FOR SELECTED STATIONS IN WESTERN COLOMBIA,
W70-03486 02B

RAINFALL-RUNOFF RELATIONSHIPS
A NONLINEAR APPROACH TO RUNOFF STUDIES,
W70-03290 02A

AN ALTERNATIVE PHYSICAL APPROACH TO WATERSHED ANALYSIS AND STREAMFLOW ESTIMATION,
W70-03291 02A

THRESHOLD CONSIDERATIONS AND THEIR GENERAL IMPORTANCE FOR HYDROLOGIC SYSTEMS INVESTIGATION,
W70-03292 02A

FLOOD FORECASTING IN THE RIVER KITAKAMI,
W70-03293 02A

FLOW ROUTING BY DIRECT INTEGRATION METHOD,
W70-03294 02E

COMPARISON OF COMPUTED AND OBSERVED FLOOD ROUTING IN A CIRCULAR CROSS-SECTION,
W70-03295 02E

THE CHEMICAL AND PHYSICAL PARAMETERS IN A HYDROLOGIC TRANSPORT MODEL FOR RADIOACTIVE AEROSOLS,
W70-03296 02A

A STOCHASTIC CONSIDERATION ON VARIATION OF HYDROLOGIC QUANTITIES,
W70-03305 02A

HYDROLOGIC STUDIES OF SMALL WATERSHEDS, COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1955-64,
W70-03467 02E

THE MECHANISM OF DIRECT SURFACE RUNOFF FROM RAINFALL,
W70-03475 02E

THE SIMULATION OF INFILTRATION FOR STUDIES IN OVERLAND FLOW,
W70-03492 02A

RAPID EXCAVATION
NUCLEAR EXCAVATION REVIEW AND ANALYSIS,
W70-03362 08H

RASBORA HETEROMORPHA(HARLEQUIN)
SURVIVAL OF FISH IN 164 HERBICIDES, INSECTICIDES, FUNGICIDES, WETTING AGENTS AND MISCELLANEOUS SUBSTANCES,
W70-03623 05C

RECHARGE WELLS
INJECTION WELL EXPERIENCE AT RIVERHEAD, N.Y.,
W70-03249 04B

RECLAIMED WATER
OPPORTUNITIES FOR WATER SALVAGE,
W70-03251 05D

RECOVERY
THE EFFECTS OF A ROTENONE TREATMENT ON THE INSECT FAUNA OF A CALIFORNIA STREAM,
W70-03624 05C

RECREATION
THE ISSUE OF THE LAKEFRONT, AN HISTORICAL CRITICAL SURVEY,
W70-03338 06B

CONSERVATION OF NATURAL RESOURCES (FISHING).
W70-03407 06E

COMPACT CONCERNING PYMATUNING LAKE.
W70-03411 06E

THE ROLE OF RESERVOIR OWNER POLICIES IN GUIDING RESERVOIR LAND DEVELOPMENT,
W70-03616 06B

RECREATION FACILITIES
LAND AND WATER CONSERVATION FUND ACT (DEPARTMENT OF INTERIOR).
W70-03391 06B

LAND AND WATER CONSERVATION FUND ACT (DEPARTMENT OF AGRICULTURE).
W70-03392 06B

RECREATIONAL FACILITIES
LAND AND WATER CONSERVATION ACT (DEPARTMENTS OF COMMERCE AND DEFENSE).
W70-03393 06B

LAND AND WATER CONSERVATION FUND ACT (THE APPALACHIAN REGIONAL COMMISSION, TENNESSEE VALLEY AUTHORITY, THE WATER RESOURCES COUNCIL, AND CERTAIN DEPARTMENTS).
W70-03394 06B

REFUGE HARBORS
WATERCRAFT NAVIGATION.
W70-03408 06E

REGULATION
LINCOLN'S EXPERIENCE IN REGULATING FLOOD PLAIN DEVELOPMENT,
W70-03341 06F

WATERS AND WATERCOURSES CRIMINAL OFFENSES.
W70-03597 06E

WATER SUPPLY - SANITATION - DITCHES (ORGANIZATION AND PURPOSES OF CONSERVANCY DISTRICTS).
W70-03643 04A

REGULATORY BIOLOGY
PHYSIOLOGICAL AND REGULATORY ASPECTS OF HETEROTROPHY IN ALGAL FLAGELLATES CONDITIONALLY EXPRESSED CHARACTERISTICS,
W70-03336 05C

REINFORCING
THE PRINCIPLE OF REINFORCED EARTH,
W70-03359 08D

REINFOREMENT
THE PRINCIPLE OF REINFORCED EARTH,
W70-03359 08D

RELOCATION
THE RETURN OF THE BLUEBACK SALMON TO THE COLUMBIA RIVER,
W70-03546 05C

RESERVATION DOCTRINE
ARE WE LOSING OUR LAKES,
W70-03382 06E

ARE WE LOSING OUR LAKES (STATE'S ACQUISITION OF TITLE UPON ADMISSION TO THE UNION),
W70-03383 06E

ARE WE LOSING OUR LAKES. (STATE'S ACQUISITION OF TITLE THROUGH CONSTRUCTION OF FEDERAL PATENTS ACCORDING TO LOCAL LAW),
W70-03384 06E

RESERVOIR FISHERIES
THE INFLUENCE OF SOME ENVIRONMENTAL FACTORS ON STANDING CROP AND HARVEST OF FISHES IN US RESERVOIRS,
W70-03324 02H

RESERVOIR OPERATION
RELIABILITY ESTIMATES FOR A STORAGE RESERVOIR WITH SEASONAL INPUT,
W70-03498 04A

RESERVOIR OWNERS
THE ROLE OF RESERVOIR OWNER POLICIES IN GUIDING RESERVOIR LAND DEVELOPMENT,
W70-03616 06B

RESERVOIR YIELD
RELIABILITY ESTIMATES FOR A STORAGE RESERVOIR WITH SEASONAL INPUT,
W70-03498 04A

RESERVOIRS
WATER RESERVOIR SYSTEMS.
W70-03435 04A

DIVISION OF WATER DEVELOPMENT.
W70-03491 03B

COMPARATIVE HYDROCHEMICAL CHARACTERISTIC OF RESERVOIRS - COOLERS OF STATE REGIONAL ELECTRIC POWER (HEAT) STATIONS OF THE UKRAINE (IN RUSSIAN),
W70-03539 05C

HORIZONTAL AND VERTICAL DISTRIBUTION OF TEMPERATURE, OXYGEN, PH AND WATER MOVEMENTS IN SLAPY RESERVOIR (1958-1960),
W70-03541 02H

THERMAL-HYDRAULIC STUDY - ARKANSAS COOLING RESERVOIR,
W70-03542 05D

THE ROLE OF RESERVOIR OWNER POLICIES IN GUIDING RESERVOIR LAND DEVELOPMENT,
W70-03616 06B

RESIDUE DISTRIBUTION
UPTAKE AND RETENTION OF MALATHION BY THE CARP,
W70-03516 05C

RESOURCE ALLOCATION
AN ECONOMIC APPROACH TO REGIONAL INDUSTRIAL WASTE MANAGEMENT,
W70-03619 05G

RETENTION
UPTAKE AND RETENTION OF MALATHION BY THE CARP,
W70-03516 05C

RETURN FLOW
IDENTIFICATION OF RETURN IRRIGATION WATER IN THE SUBSURFACE WATER QUALITY,
W70-03430 05B

REVIEWS
WATER AND MAN A WORLD VIEW,
W70-03450 06G

ARROGANCE TOWARD THE LANDSCAPE A PROBLEM IN WATER PLANNING,
W70-03465 06G

RHODE ISLAND
FISH TRAPS LICENSING AND REGULATION.
W70-03638 06E

RIGHT-OF-WAY
MULTIPLE USE OF RIGHTS OF WAY A CHALLENGE TO THE PAST,
W70-03376 08C

RIPARIAN LAND
STATE'S POWER OVER WATERS OF LAKE ERIE AND OVER LEASING OF LAKEFRONT LAND FOR PRIVATE IMPROVEMENT.
W70-03410 06E

RIPARIAN RIGHTS
PIRMAN V FLORIDA STATE IMPROVEMENT COMM'N, AND STATE RD. DEP'T OF FLORIDA (BRIDGE CONSTRUCTION).
W70-03300 04A

PUBLIC RIGHTS TO USE AND HAVE ACCESS TO NAVIGABLE WATERS,
W70-03380 06E

ARE WE LOSING OUR LAKES,
W70-03382 06E

ARE WE LOSING OUR LAKES. (STATE'S ACQUISITION OF TITLE THROUGH CONSTRUCTION OF FEDERAL PATENTS ACCORDING TO LOCAL LAW),
W70-03384 06E

AUTHORITY OF CITIES TO DEVELOP SEWAGE SYSTEMS, AND TO IMPROVE LAKES AND WATERCOURSES.
W70-03534 05G

DUVAL ENGINEERING AND CONTRACTING CO V SALES (RIPARIAN RIGHTS).
W70-03563 06E

LAND FOR INSTITUTIONAL WATER OR SEWAGE SYSTEM.
W70-03599 06E

RIPPLE MARKS
INTERNAL STRUCTURE OF WAVE-FORMED RIPPLE MARKS IN THE NEARSHORE ZONE,
W70-03284 02L

INTRICATED CROSS-STRATIFICATION DUE TO INTERACTION OF A MEGA RIPPLE WITH ITS LEE-SIDE SYSTEM OF BACKFLOW RIPPLES (UPPER-POINTBAR DEPOSITS, LOWER RHINE),
W70-03289 02J

RISKS
SOCIAL BENEFIT VERSUS TECHNOLOGICAL RISK,
W70-03377 06B

RIVER BASIN DEVELOPMENT
OHIO VALLEY SANITATION COMPACT.
W70-03415 05G

TENNESSEE-TOMBIGBEE WATERWAY DEVELOPMENT COMPACT.
W70-03422 06B

RIVER BASINS
REPORT OF COMMITTEE ON POLLUTION.
W70-03378 05G

ANALYSIS OF MANAGERIAL, FINANCIAL, AND REGULATORY FUNCTIONS OF REGIONAL WATER RESOURCES AUTHORITIES AND OTHER INSTITUTIONAL ARRANGEMENTS.
W70-03611 06B

RIVER BEDS
STATISTICAL PROPERTIES OF BED FORMS IN ALLUVIAL CHANNELS IN RELATION TO FLOW RESISTANCE,
W70-03620 08B

RIVERS
OWNERSHIP OF THE BEDS AND BOTTOMS OF NAVIGABLE WATERS IN LOUISIANA,
W70-03386 06E

PALEOHYDROLOGY APPLICATION OF MODERN HYDROLOGIC DATA TO PROBLEMS OF THE ANCIENT PAST,
W70-03490 02A

ROAD CONSTRUCTION
HIGHWAY TO ISLANDS IN MISSISSIPPI RIVER.
W70-03538 04A

GRIMES V POLK COUNTY (PUBLIC RIGHTS IN PRIVATE DRAINAGE SYSTEMS).
W70-03562 04A

ROADS
SUPERVISION OF LOCAL IMPROVEMENTS.
W70-03602 06E

STATE HIGHWAY SYSTEM.
W70-03603 04A

ROOT EFFECT
SOME EFFECTS OF CARBON DIOXIDE ON THE BLOOD OF RAINBOW TROUT SALMO GAIRDNERI RICHARDSON,
W70-03522 05C

ROOT ZONES
ROOTING PATTERNS OF FOREST UNDERSTORY SPECIES AS DETERMINED BY RADIOIODINE ABSORPTION,
W70-03626 02I

ROOTING PATTERNS
ROOTING PATTERNS OF FOREST UNDERSTORY SPECIES AS DETERMINED BY RADIOIODINE ABSORPTION,
W70-03626 02I

ROTENONE
THE EFFECTS OF A ROTENONE TREATMENT ON THE INSECT FAUNA OF A CALIFORNIA STREAM,
W70-03624 05C

ROUGHNESS(HYDRAULIC)
STATISTICAL PROPERTIES OF BED FORMS IN ALLUVIAL CHANNELS IN RELATION TO FLOW RESISTANCE,
W70-03620 08B

ROUTING
AN ALTERNATIVE PHYSICAL APPROACH TO WATERSHED ANALYSIS AND STREAMFLOW ESTIMATION,
W70-03291 02A

FLOW ROUTING BY DIRECT INTEGRATION METHOD,
W70-03294 02E

THE MECHANISM OF DIRECT SURFACE RUNOFF FROM RAINFALL,
W70-03475 02E

RUNOFF
PALEOHYDROLOGY APPLICATION OF MODERN HYDROLOGIC DATA TO PROBLEMS OF THE ANCIENT PAST,
W70-03490 02A

CHEMICAL AND DETRITAL FEATURES OF PALOUSE RIVER, IDAHO, RUNOFF FLOWAGE,
W70-03501 05B

ROOTING PATTERNS OF FOREST UNDERSTORY SPECIES AS DETERMINED BY RADIOIODINE ABSORPTION,
W70-03626 02I

RUNOFF FORECASTING
A NONLINEAR APPROACH TO RUNOFF STUDIES,
W70-03290 02A

THE CHEMICAL AND PHYSICAL PARAMETERS IN A HYDROLOGIC TRANSPORT MODEL FOR RADIOACTIVE AEROSOLS,
W70-03296 02A

RIVER RUNOFF AS A STOCHASTIC PROCESS, AND ITS MATHEMATICAL MODELLING,
W70-03304 02A

SAFETY
BOATING SAFETY ACT OF 1965.
W70-03423 06E

SALINE WATER
SURFACE PROPERTIES OF TEFLON FILM IN SALINE WATER PROCESSES,
W70-03646 03A

SALINITY
EXPERIMENTS ON HALINE CONVECTION INDUCED BY THE FREEZING OF SEA WATER,
W70-03464 02C

SAMPLING
A NEW RECORDING TURBIDITY METER FOR RIVERS,
W70-03277 07B

PRELIMINARY STUDIES OF ZOOPLANKTON DISTRIBUTION WITH THE CONTINUOUS PLANKTON RECORDER,
W70-03506 02H

SAND
FILTRATION OF ACTIVATED SLUDGE SECONDARY EFFLUENTS THROUGH SAND AND ANTHRACITE-SAND BEDS,
W70-03353 05D

SAND WAVES
INTRICATED CROSS-STRATIFICATION DUE TO INTERACTION OF A MEGA RIPPLE WITH ITS LEE-SIDE SYSTEM OF BACKFLOW RIPPLES (UPPER-POINTBAR DEPOSITS, LOWER RHINE),
W70-03289 02J

SANDS
WEATHERING AND ROUNDNESS OF QUARTZ SAND GRAINS,
W70-03283 02J

GEOLOGICAL AND MINERALOGICAL STUDIES OF SOME SAND DEPOSITS IN THE NILE DELTA, U.A.R.,
W70-03469 02L

SANITARY DISTRICT
WATERWORKS AND SEWERAGE.
W70-03535 05G

SANITARY ENGINEERING
POWERS OF THE WATER POLLUTION CONTROL BOARD.
W70-03398 05G

SCALING
SURFACE PROPERTIES OF TEFLON FILM IN SALINE WATER PROCESSES,
W70-03646 03A

SCENEDESMUS
EFFECT OF SURFACE/VOLUME RELATIONSHIP, CO-SUB-2 ADDITION, AERATION, AND MIXING ON NITRATE UTILIZATION BY SCENEDESMUS CULTURES IN SUBSURFACE AGRICULTURAL WASTE WATERS,
W70-03334 05D

SCOURING WASTE
AN INDUSTRIAL WASTE GUIDE TO THE WOOL PROCESSING INDUSTRY.
W70-03531 05D

SEA WATER
LABORATORY COMPARISONS OF FRESH-WATER AND SALT-WATER WHITECAPS,
W70-03451 01B

EXPERIMENTS ON HALINE CONVECTION INDUCED BY THE FREEZING OF SEA WATER,
W70-03464 02C

SEAS
MARITIME CONTIGUOUS ZONES,
W70-03381 06E

SEASONAL
STUDIES ON THE SEDIMENTATION IN LAKE BIWA FROM THE VIEWPOINT OF LAKE METABOLISM,
W70-03319 02H

SEDIMENT TRANSPORT
SEDIMENT INVESTIGATION IN BIG SAND COULEE BASIN, WYOMING AND MONTANA,
W70-03457 02J

THE EFFECT OF A PERMEABLE SAND BED ON SEDIMENT MOTION,
W70-03617 02J

SEDIMENTARY PETROLOGY
X-RAY RADIOGRAPHY FOR EXAMINATION OF BURROWING IN SEDIMENTS BY MARINE INVERTEBRATE ORGANISMS,
W70-03286 02J

HEAVY MINERALS AND SIZE ANALYSIS OF THE CITRONELLE FORMATION OF THE GULF COASTAL PLAIN,
W70-03445 02J

GEOLOGICAL AND MINERALOGICAL STUDIES OF SOME SAND DEPOSITS IN THE NILE DELTA, U.A.R.,
W70-03469 02L

SEDIMENTARY STRUCTURES
INTERNAL STRUCTURE OF WAVE-FORMED RIPPLE MARKS IN THE NEARSHORE ZONE,
W70-03284 02L

INTRICATED CROSS-STRATIFICATION DUE TO INTERACTION OF A MEGA RIPPLE WITH ITS LEE-SIDE SYSTEM OF BACKFLOW RIPPLES (UPPER-POINTBAR DEPOSITS, LOWER RHINE),
W70-03289 02J

SEDIMENTATION
STUDIES ON THE SEDIMENTATION IN LAKE BIWA FROM THE VIEWPOINT OF LAKE METABOLISM,
W70-03319 02H

RECENT SEDIMENTATION IN NORTHERN CARDIGAN BAY, WALES,
W70-03478 02L

PALEOHYDROLOGY APPLICATION OF MODERN HYDROLOGIC DATA TO PROBLEMS OF THE ANCIENT PAST,
W70-03490 02A

RECENT SEDIMENTATION IN THE BERING SEA,
W70-03500 02L

SEDIMENTS
OCCURRENCE AND SIGNIFICANCE OF IRON, MANGANESE, AND TITANIUM IN GLACIAL MARINE SEDIMENTS FROM THE ESTUARY OF THE ST LAWRENCE RIVER,
W70-03320 02K

CONSOLIDATION AND SEDIMENTATION-COMPRESSION STUDIES OF A CALCAREOUS CORE, EXUMA SOUND, BAHAMAS,
W70-03448 08E

THE EFFECT OF FRESH WATER ON THE REDISTRIBUTION OF URANIUM IN CARBONATE SEDIMENTS,
W70-03468 02K

GEOLOGICAL AND MINERALOGICAL STUDIES OF SOME SAND DEPOSITS IN THE NILE DELTA, U.A.R.,
W70-03469 02L

A NON-DESTRUCTIVE CORE ANALYSIS TECHNIQUE USING X-RAYS,
W70-03470 07B

IRON-RICH LAYERS IN SEDIMENTS FROM THE GULF OF MEXICO,
W70-03471 02J

A GRAIN SIZE ANALYSIS OF LONGSHORE-BARS AND TROUGHS, LAKE SUPERIOR, ONTARIO,
W70-03472 02H

CHEMICAL AND DETRITAL FEATURES OF PALOUSE RIVER, IDAHO, RUNOFF FLOWAGE,
W70-03501 05B

SEDIMENT-WATER INTERFACES
THE EFFECT OF A PERMEABLE SAND BED ON SEDIMENT MOTION,
W70-03617 02J

SEEPAGE
THE EFFECT OF A PERMEABLE SAND BED ON SEDIMENT MOTION,
W70-03617 02J

SELF-PURIFICATION
EFFECT OF ORGANIC WASTE AND COOLING WATER ON SELF-PURIFICATION OF WATERS,
W70-03547 05C

SENSITIVITY
INCREASED SENSITIVITY TO PESTICIDES IN SHEEPSHEAD MINNOWS,
W70-03621 05C

SENSITIVITY ANALYSIS
USE OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES,
W70-03488 05B

SEPTIC TANKS
HEALTH WATER, SEWAGE, GARBAGE.
W70-03629 05F

HEALTH WATER, SEWAGE, GARBAGE (PRIVIES, SEWAGE SYSTEMS, SEPTIC TANKS).
W70-03631 05F

HEALTH WATER, SEWAGE, GARBAGE (PAWLEY'S ISLAND, GREENVILLE COUNTY, SPARTENBURG COUNTY, AIKEN COUNTY).
W70-03632 05F

SESTON
CHEMICAL AND DETRITAL FEATURES OF PALOUSE RIVER, IDAHO, RUNOFF FLOWAGE,
W70-03501 05B

SEVIN
AVOIDANCE OF PESTICIDES BY UNTRAINED SHEEPSHEAD MINNOWS,
W70-03622 05C

SEWAGE
MEASUREMENT OF PHOSPHORUS IN WASTEWATER,
W70-03331 05A

HEALTH WATER, SEWAGE, GARBAGE.
W70-03629 05F

SEWAGE DISPOSAL
WATERWORKS AND SEWERAGE.
W70-03535 05G

HEALTH WATER, SEWAGE, GARBAGE (PAWLEY'S ISLAND, GREENVILLE COUNTY, SPARTENBURG COUNTY, AIKEN COUNTY).
W70-03632 05F

SEWAGE DISTRICTS
OPINION OF THE JUSTICES (WATER AND SEWER DISTRICT LEGISLATION).
W70-03564 04A

SEWAGE LAGOONS
MICROBIOLOGY OF SEWAGE LAGOONS-EFFECTS OF INDUSTRIAL WASTES ON LAGOON ECOLOGY,
W70-03312 05C

SEWAGE SLUDGE
MATHEMATICAL MODEL OF SEWAGE SLUDGE FLUIDIZED BED INCINERATOR CAPACITIES AND COSTS,
W70-03610 05G

SEWAGE TREATED EFFLUENT
FILTRATION OF ACTIVATED SLUDGE SECONDARY EFFLUENTS THROUGH SAND AND ANTHRACITE-SAND BEDS,
W70-03353 05D

SEWERS
JET DIFFUSION, REVIEW OF MODEL TESTING AND COMPARISON WITH THEORY,
W70-03555 08B

SHAD FISHING
SHAD FISHING IN THE DELAWARE RIVER, BAY, AND TRIBUTARIES.
W70-03639 06E

SHAGAWA LAKE(MINN)
THE SHAGAWA LAKE, MINNESOTA, EUTROPHICATION RESEARCH PROJECT,
W70-03512 05C

SHEEPSHEAD MINNOWS
INCREASED SENSITIVITY TO PESTICIDES IN SHEEPSHEAD MINNOWS,
W70-03621 05C

SHELL GROWTH
THE EFFECTS OF OIL-SPILL REMOVERS ('DETERGENTS') ON THE GASTROPOD NUCELLA LAPILLUS ON A ROCKY SHORE AND IN THE LABORATORY,
W70-03513 05C

SHOCK WAVES
VIBRATION OF NAVAJO DAM FOLLOWING A SUBSURFACE NUCLEAR BLAST,

W70-03370 08D

SHORE PROTECTION
CONSERVATION OF NATURAL RESOURCES (SHORE EROSION).
W70-03405 04D

SIEVE ANALYSIS
PARTICLE SHAPE AND INFERENCE OF SIZE FROM SIEVING,
W70-03287 02J

SIMULATED RAINFALL
THE SIMULATION OF INFILTRATION FOR STUDIES IN OVERLAND FLOW,
W70-03492 02A

SIMULATION
EVALUATION AND APPLICAON OF A DIGITAL HYDROLOGIC SIMULATION MODEL,
W70-03436 02A

SIMULATION ANALYSIS
SIMILITUDE FOR FLOW OF TWO FLUIDS IN POROUS MEDIA,
W70-03297 02F

SLOPE STABILITY
THE EFFECT OF A PERMEABLE SAND BED ON SEDIMENT MOTION,
W70-03617 02J

SLUICES
PUBLIC MILLS (FREE PASSAGE OF WATER THROUGH MILL SLUICES).
W70-03592 04A

SLUICEWAY
PUBLIC UTILITIES AND CARRIERS.
W70-03586 06E

SMALL WATERSHEDS
HYDROLOGIC STUDIES OF SMALL WATERSHEDS, COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1955-64,
W70-03467 02E

SNAKE RIVER CANYON(IDAHO)
A MICROCLIMATIC PROFILE BETWEEN THE SNAKE RIVER CANYON AND CLEARWATER MOUNTAINS, IDAHO,
W70-03645 02B

SOCIAL NEEDS
PRESIDENT'S LECTURE LIMNOLOGY, SOCIAL WELFARE, AND LAKE KINNERET,
W70-03509 02H

SOCIAL VALUES
SOCIAL BENEFIT VERSUS TECHNOLOGICAL RISK,
W70-03377 06B

SOIL STRENGTH
CONSOLIDATION AND SEDIMENTATION-COMPRESSION STUDIES OF A CALCAREOUS CORE, EXUMA SOUND, BAHAMAS,
W70-03448 08E

SOLAR RADIATION
HYPOLIMNETIC HEATING IN CASTLE LAKE, CALIFORNIA,
W70-03551 05A

SOUTH CAROLINA
QUALITY OF SURFACE WATERS OF SOUTH CAROLINA A SUMMARY OF DATA, 1945-1968,
W70-03266 05B

HEALTH WATER, SEWAGE, GARBAGE.
W70-03629 05F

HEALTH WATER, SEWAGE, GARBAGE (WATER SUPPLIES - WATER SUPPLY OF GREENVILLE).
W70-03630 05F

HEALTH WATER, SEWAGE, GARBAGE (PRIVIES, SEWAGE SYSTEMS, SEPTIC TANKS).
W70-03631 05F

HEALTH WATER, SEWAGE, GARBAGE (PAWLEY'S ISLAND, GREENVILLE COUNTY, SPARTENBURG COUNTY, AIKEN COUNTY).
W70-03632 05F

SOUTH DAKOTA
ARE WE LOSING OUR LAKES. (HAVE THE STATES APPLIED BOTH THEORIES TO RETAIN CONTROL OF THE LAKES),
W70-03385 06E

SPECIES COMPOSITION
SOME EFFECTS OF LAKE RENEWAL ON PHYTOPLANKTON PRODUCTIVITY AND SPECIES COMPOSITION,
W70-03328 02H

SPECIFICATIONS
DEVELOPMENT AND EVALUATION OF STANDARD TEST METHODS, THE ROLE OF STATISTICAL DESIGN OF EXPERIMENTS,
W70-03354 08G

ST LAWRENCE RIVER
COMPONENTS OF THE BOTTOM FAUNA OF THE ST LAWRENCE, GREAT LAKES,
W70-03315 02H

STANFORD WATERSHED MODEL
EVALUATION AND APPLICAON OF A DIGITAL HYDROLOGIC SIMULATION MODEL,
W70-03436 02A

STATE GOVERNMENTS
PAYMENTS TO STATE FOR WATERS DIVERTED.
W70-03517 06D

STATISTICAL METHODS
COHERENCE ANALYSIS OF STATIONARY PROCESSES WITH APPLICATIONS TO HYDROLOGY,
W70-03256 07C

REDUCTION OF SERIALLY CORRELATED HYDROLOGIC DATA,
W70-03263 07C

PARTICLE SHAPE AND INFERENCE OF SIZE FROM SIEVING,
W70-03287 02J

VARIATIONS IN STATISTICAL MEASURES WITH THE LENGTH OF STREAMFLOW RECORDS,
W70-03303 07C

RIVER RUNOFF AS A STOCHASTIC PROCESS, AND ITS MATHEMATICAL MODELLING,
W70-03304 02A

A STOCHASTIC CONSIDERATION ON VARIATION OF HYDROLOGIC QUANTITIES,
W70-03305 02A

DEVELOPMENT AND EVALUATION OF STANDARD TEST METHODS, THE ROLE OF STATISTICAL DESIGN OF EXPERIMENTS,
W70-03354 08G

STOCHASTIC DESCRIPTION OF DAILY RIVER FLOWS,
W70-03497 02E

RELIABILITY ESTIMATES FOR A STORAGE RESERVOIR WITH SEASONAL INPUT,
W70-03498 04A

STEAMBOATS
PUBLIC MILLS (FREE PASSAGE OF WATER THROUGH MILL SLUICES).
W70-03592 04A

STEP AERATION
OPTIMIZATION OF STEP AERATION WASTE TREATMENT SYSTEMS,
W70-03614 05D

STOCHASTIC PROCESSES
A PARTICULAR STOCHASTIC PROCESS AS APPLIED TO HYDROLOGY,
W70-03301 02A

SIMULATION OF RUNOFF FOR DESIGN OF WATER RESOURCE SYSTEMS,
W70-03496 02A

STOCHASTIC DESCRIPTION OF DAILY RIVER FLOWS,
W70-03497 02E

STORM DRAINS
COMPARISON OF COMPUTED AND OBSERVED FLOOD ROUTING IN A CIRCULAR CROSS-SECTION,
W70-03295 02E

STRAIN
MEASUREMENT OF EARTH DISPLACEMENTS INDUCED BY FLUID FLOW,
W70-03455 02G

STRAIN MEASUREMENT
MEASUREMENT OF EARTH DISPLACEMENTS INDUCED BY FLUID FLOW,
W70-03455 02G

STRATIFICATION
STREAMFLOW EFFECTS IN A STRATIFIED MODEL RESERVOIR,
W70-03543 08B

DISCUSSION OF 'TURBULENT MIXING PHENOMENA OF OCEAN OUTFALLS' BY R. FRANKEL AND J. COMMING,
W70-03553 08B

DISCUSSION OF 'HORIZONTAL JETS IN STAGNANT FLUID OF OTHER DENSITY' BY G. ABRAHAM,
W70-03560 08B

STRATIFIED FLOW
MECHANICS OF STRATIFIED FLOW THROUGH ORIFICES,
W70-03544 08B

STREAM GAGES
MEAN STREAMFLOW FROM DISCHARGE MEASUREMENTS,
W70-03280 02E

STREAM LENGTH
RELATION OF DISCHARGE AND STREAM LENGTH IN EASTERN UNITED STATES,
W70-03487 02E

STREAMFLOW
REDUCTION OF SERIALLY CORRELATED HYDROLOGIC DATA,
W70-03263 07C

MEAN STREAMFLOW FROM DISCHARGE MEASUREMENTS,

TEMPERATURES SELECTED BY TILAPIA MOSSAMBICA (PETERS) IN A TEST TANK WITH A HORIZONTAL TEMPERATURE GRADIENT,
W70-03556 05C

UPPSALA UNIV. (SWEDEN). INST. OF LIMNOLOGY.
LIMNOLOGICAL STUDIES OF LAKE NORRVIKEN, A EUTROPHICATED SWEDISH LAKE. I. WATER CHEMISTRY AND NUTRIENT BUDGET,
W70-03322 02H

PRESIDENT'S LECTURE LIMNOLOGY, SOCIAL WELFARE, AND LAKE KINNERET,
W70-03509 02H

UTAH UNIV., SALT LAKE CITY. DEPT. OF GEOLOGICAL AND GEOPHYSICAL SCIENCES.
RECONNAISSANCE APPRAISAL OF THE WATER RESOURCES NEAR ESCALANTE, GARFIELD COUNTY, UTAH,
W70-03454 02F

UTRECHT RIJKSUNIVERSITEIT (NETHERLANDS). GEOLOGICAL INST. AND STATE GEOLOGICAL SURVEY, HAARLEM (NETHERLANDS).
INTRICATED CROSS-STRATIFICATION DUE TO INTERACTION OF A MEGA RIPPLE WITH ITS LEE-SIDE SYSTEM OF BACKFLOW RIPPLES (UPPER-POINTBAR DEPOSITS, LOWER RHINE),
W70-03289 02J

VANDERBILT UNIV., NASHVILLE, TENN. DEPT. OF ENVIRONMENTAL AND WATER RESOURCES ENGINEERING.
THE EFFECTS OF IMPOUNDING RESERVOIRS ON RIVER WASTE ASSIMILATIVE CAPACITY,
W70-03550 05C

VIRGINIA POLYTECHNIC INST., BLACKSBURG. WATER RESOURCES RESEARCH CENTER.
SOME WATER QUALITY ASPECTS OF THE UPPER ROANOKE RIVER BASIN WITH SPECIAL EMPHASIS ON TEMPERATURE,
W70-03244 05C

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF ZOOLOGY.
ECOLOGICAL TECHNIQUES UTILIZING RADIONUCLIDES AND IONIZING RADIATION - A SELECTED BIBLIOGRAPHY,
W70-03308 07B

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERING.

CURRENT PRACTICE IN POTATO PROCESSING WASTE TREATMENT,
W70-03433 05D

WASHINGTON UNIV., SEATTLE. DEPT. OF ZOOLOGY.
ALGAL GROWTH AND PRIMARY PRODUCTIVITY IN A THERMAL STREAM,
W70-03309 05C

WASHINGTON UNIV., SEATTLE. LAB. OF RADIATION ECOLOGY.
EFFECTS OF TEMPERATURE UPON THE FORMATION OF VERTEBRAE AND FIN RAYS IN YOUNG CHINOOK SALMON,
W70-03557 05C

WATERLOO UNIV (ONTARIO).
VARIATIONS IN STATISTICAL MEASURES WITH THE LENGTH OF STREAMFLOW RECORDS,
W70-03303 07C

WATERLOOPKUNDIG LABORATORIUM, DELFT (NETHERLANDS).
ENTRAINMENT PRINCIPLE AND ITS RESTRICTIONS TO SOLVE PROBLEMS OF JETS,
W70-03545 08B

WESTERN FISH DISEASE LAB., SEATTLE, WASH.
SOME FACTORS INFLUENCING SUSCEPTIBILITY OF RAINBOW TROUT TO THE ACUTE TOXICITY OF AN ETHYL MERCURY PHOSPHATE FORMULATION (TIMSAN),
W70-03523 05C

WISCONSIN UNIV., MADISON.
RECENT SEDIMENTATION IN NORTHERN CARDIGAN BAY, WALES,
W70-03478 02L

WISCONSIN UNIV., MADISON. DEPT. OF BOTANY.
CONTROL OF BLUE-GREEN ALGAE BLOOMS WITH 2,3-DICHLORONAPHTHOQUINONE,
W70-03310 05G

THE MINERAL NUTRITION OF MICROCYSTIS AERUGINOSA,
W70-03507 05C

WISCONSIN UNIV., MADISON. DEPT. OF ENTOMOLOGY.
ECOLOGY OF CHIRONOMIDAE, CHAOBORIDAE, AND OTHER BENTHOS IN FOURTEEN WISCONSIN LAKES,
W70-03333 02H

WISCONSIN UNIV., MADISON. DEPT. OF SOIL SCIENCE.
ACTUAL EVAPOTRANSPIRATION AS DETERMINED FROM SOIL-WATER AND CANOPY CHARACTERISTICS AND POTENTIAL EVAPOTRANSPIRATION,
W70-03449 02D

WISCONSIN UNIV., MADISON. WATER RESOURCES CENTER.
FILTRATION OF ACTIVATED SLUDGE SECONDARY EFFLUENTS THROUGH SAND AND ANTHRACITE-SAND BEDS,
W70-03353 05D

BIOLOGICAL N2 FIXATION IN LAKES,
W70-03429 05C

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
EDGARDO BALDI MEMORIAL LECTURE CURRENT CONCEPTS IN AQUATIC MICROBIOLOGY,
W70-03510 05C

WORCESTER POLYTECHNIC INST., MASS.
USE OF RIVER MODELS IN COOLING CIRCULATING WATER STUDIES,
W70-03549 05B

WRIGHT-MCLAUGHLIN ENGINEERS, DENVER, COLO.
MULTI-MEANS EFFORT FOR URBAN FLOOD CONTROL,
W70-03343 04C

YALE UNIV., NEW HAVEN, CONN.
EXPERIMENTS ON HALINE CONVECTION INDUCED BY THE FREEZING OF SEA WATER,
W70-03464 02C

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 3, NUMBER 10
MAY 15, 1970

THE LIBRARY OF THE
JUN - 3 1970
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W70-03647 -- W70-04044

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 10
MAY 15, 1970

W70-03647 -- W70-04044

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

NUMERICAL MODEL FOR THE YDROLOGIC TRANSPORT OF RADIOACIVE AEROSOLS FROM PRECIPITATION TO /ATER SUPPLIES,
tanford Univ., Calif. Dept. of Civil Engineering.
ale D. Huff, and Paul Kruger.
: Isotope Techniques in the Hydrologic Cycle, eophysical Monograph Series, No 11, American eophysical Union, p 85-96, 1967. 12 p, 4 fig, 2 ib, 22 ref. USPHS Res Grant ES-00047-01.

escriptors: *Radioactivity techniques, *Mathetatical models, *Aersols, *Hydrologic cycle, Path of pollutants, Precipitation (Atmospheric), /ater supply, Radioisotopes, Runoff, Watersheds Basins), Hydrographs, Rainfall-runoff relationips, Numerical analysis.
dentifiers: *Radioactive aerosols.

reparation is underway of a numerical model of ne transport of nuclear debris from the atosphere by precipitation through the surfaceater portion of the hydrologic cycle. The model ollates the significant parameters involved, such s the physical and chemical properties of biologially important radionuclides in aerosols, their eposition by precipitation under Pacific coast yclonic conditions, and their movement through ne catchment basin during precipitation and ruoff. The model is based upon the quantitative estiation of these parameters under conditions given y an existing computer model which traces the ovement of water through the basin to predict the unoff hydrograph. The numerical model should erve as an index of predictability for radionuclide oncentration in water supplies originating from atospheric sources and as a means to locate areas here additional numerical knowledge of ydrologic processes is needed. A MOSAIC TECHNIQUE FOR GENERATING HE DAILY PATTERN WITHIN A SYNTHETIC LOW SEQUENCE,
Welsh Coll. of Advanced Technology, Cardiff; and Water Research Association, Medmenham (England).
G. J. Cockell, and J. A. Cole.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 36, p 277-282, 1967. 6 p, 1 tab, 4 ref, append.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Synthetic hydrology, *Probability, Markov processes, Hydrologic data, Unit hydrographs, Streamflow forecasting, Runoff forecasting, Discharge (Water), Computer programs.
Identifiers: Watershed models.

A realistic pattern of daily flows may be required for a month, in which the total flow has been synthetically determined by a Markov chain model. The mosaic technique does this by selecting specimen months from historical daily rainfall or river discharge records, giving the required total monthly runoff. By having two sets of specimen months, wit higher and lower than average runoff at the start of the month, juxtaposition of unduly disparate flows at the transition from one month to the next may be avoided. The technique is illustrated with the use of 40 specimen months of rainfall record in a river's headwaters. Seasonal runoff upon rainfall regression effect the conversion to daily available flows. They are then transformed by unit hydrographs to give the allocation of daily flows of the river and its tributaries at various downstream sites. An appendix details the computer program in Algol which operates the mosaic technique. (Knapp-USGS)

ON THE FLUCTUATION OF WATER RESOURCES,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Masami Sugawara.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 45, p 344-353, 1967. 10 p, 5 fig, 1 tab, 1 ref.

Descriptors: *Streamflow forecasting, *Reservoir operation, *Statistical methods, *Time series analysis, *Water management (Applied), Fourier analysis, Frequency analysis, Statistical models, Reservoir yield.
Identifiers: *Spectral analysis.

Hydrological data such as river discharge, precipitation, etc., show large fluctuation with time, while demand on water is approximately constant with time. To take the constant demand out of the fluctuating supply, we construct reservoirs. Draft-storage relations must depend on the fluctuations of supply. Moreover, they must depend on the spectral structure of the supply, regarded as time series. If the supply fluctuates mainly in high frequency regions, it may be smoothened by small reservoirs, but if the supply has a long period on the order of years, it is very difficult to smooth fluctuations. From this standpoint a spectral analysis of hydrological data was made using mainly monthly precipitation. Contrary to expectation, no significant cycle, except seasonal change, could be found. From an analysis of monthly precipitation of about a century, we conclude that this time series is a composition of seasonal pattern and random noise. As the time series of this type is not suitable for mathematical analysis, a numerical method is used to find the relation between the capacity of reservoir and the amount of water demand. (Knapp-USGS)
W70-03705

STOCHASTIC ASPECTS OF RESERVOIR STORAGE,
Manchester Univ. (England). Inst of Science and Technology.
J. B. White.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 46, p 354-360, 1967. 7 p, 16 ref.

Descriptors: *Streamflow forecasting, *Reservoir operation, *Statistical methods, *Water management (Applied), *Stochastic processes, Markov processes, Statistical models, Mathematical models, Synthetic hydrology, Reservoir yield, Probability.
Identifiers: Reservoir storage models.

The application of stochastic theory to reservoir storage processes (the Markov chain concept) has enabled these processes to be accurately described. An account of the findings is given. Earlier methods are then reviewed and it is shown that they are unsound in principle because either finite capacity of reservoir is ignored or annual and seasonal depletions are treated separately. Nevertheless comparison with the new approach suggests that the earlier methods may give acceptable results in cases where the probability of emptying is low. (Knapp-USGS)
W70-03706

CYCLIC FLUCTUATIONS OF VARIABILITY IN HYDROLOGIC PHENOMENA,
Water Conservancy Board, Prague (Czechoslovakia).
Oldrich Vitha, and Vladmir Soucek.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 51, p 389-396, 1967. 8 p, 5 fig, 2 tab, 3 ref.

Descriptors: *Streamflow forecasting, *Rainfall-runoff relationships, *Statistical methods, Stochastic processes, Time series analysis, Frequency analysis, Runoff forecasting, Reservoir operation, Reservoir yield, Water management (Applied).
Identifiers: Watershed models.

Investigations are made of the dependence of basic statistical parameters expressing the regime of long-term variations of runoff and precipitation series. Mathematical tests show that the mean cycle of sunspots influences the distribution, and the variability of runoff and precipitation series. Relations are verified by comparing the results from real and random artificially established runoff series. A scheme of practical use is given with an example of the calculation of the effect of a reservoir with multiyear outflow control. (Knapp-USGS)
W70-03711

SUNSPOTS AND HYDROLOGIC TIME SERIES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Ignacio Rodriquez, and Vujica Yevjevich.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 52, p 397-405, 1967. 9 p, 6 fig, 1 tab, 4 ref. NSF Grant GK-169.

Descriptors: *Hydrologic cycle, *Time series analysis, *Precipitatior (Atmospheric), *Runoff, Correlation analysis, Streamflow, Frequency analysis, Statistical methods, Rainfall disposition.
Identifiers: *Hydrologic time series, *Sunspots.

The relationship of hydrologic series of monthly precipitation, annual precipitation and annual runoff to sunspot numbers was investigated by cross-correlation analysis for various time lags (zero lag included) and by cross-spectral analysis. A total of 88 series of monthly precipitation and 174 series of annual precipitation (stations from Western United States), and 16 series of annual flows (stations from several parts of the world) were used as research data. No significant correlation was found between these hydrologic series and sunspot numbers. In fact, the spectrum of sunspot numbers proved to be nearly identical to the spectrum of residuals, when the values of hydrologic series were deduced from the values of sunspot series in order to obtain residuals. The coherence graphs worked out are within confidence limits that indicate there are no relationships between hydrologic series and sunspot numbers. Sampling fluctuations of cross-correlation coefficients between hydrologic series and

sunspot numbers increase when both series are smoothed by moving average schemes. Therefore, when the confidence limits of unsmoothed series are used in the smoothed series approach, incorrect conclusions may be drawn about the significance of correlations. (Knapp-USGS)
W70-03712

APPLICATIONS OF MONTE CARLO METHOD TO RESERVOIR DESIGN,
Institute of Water Resources Research, Berlin (East Germany).
Siegfried Dyck, and Michael Schramm.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 53, p 406-413, 1967. 8 p, 5 fig, 1 tab, 5 ref.

Descriptors: *Reservoir design, *Streamflow forecasting, *Time series analysis, *Reservoir yield, Reservoir operation, Water management (Applied), Statistical methods, Runoff forecasting.
Identifiers: Watershed models.

In applying the Monte Carlo Method to reservoir design long time series of discharge may be generated, using the method proposed by Svanidze. First, two arrangements for the correlation function are considered. Then the serial correlation coefficient between yearly river flows are calculated. To examine the connection between annual river flow and subannual changes of flow for the observed station the range of the residual mass curve of monthly flows is used. When generating time series according to the used method, negative river flows are sometimes obtained. (Knapp-USGS)

ERRORS IN DISCHARGE ESTIMATES ON MOUNTAIN STREAMS,
Ontario Agricultural Coll., Guelph. School of Agricultural Engineering.
W. T. Dickinson.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 71, p 573-580, 1967. 8 p, 2 tab, 4 ref. Bureau of Reclamation Contract No 14-06-D-5299.

Descriptors: *Streamflow forecasting, *Rainfall-runoff relationships, Data processing, Statistical methods, Evaluation, Stage-discharge relations, Discharge measurement, Estimating, Least squares method, Regression analysis.
Identifiers: Error analysis.

A mathematical representation is given to the stage-discharge relationship, and found to account for virtually all of the variability in sample data for 9 mountain stream-gaging stations in Colorado. The concept of a divisive discharge value is introduced to separate the rating curve into 2 portions; one along which the relative error is practically constant; and the other along which the absolute error remains constant. Confidence and tolerance limits are established for estimated rating curves, and used for inferences regarding the error bounds on daily discharge estimates and future discharge measurements. Consideration is given to the correlation between errors in single discharge estimates, and estimates are made regarding the error bounds on monthly, semiannual, and annual discharge determinations. (Knapp-USGS)
W70-03889

LARGE-SCALE UTILIZATION OF TRITIUM IN HYDROLOGIC STUDIES,
Stockholm Univ. (Sweden). International Meteorological Inst.
Erik Eriksson.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 153-156, 1967. 4 p, 8 ref. Atomic Energy Commission Contract AT (30-1)-2458.

Descriptors: *Hydrologic properties, *Radioisotopes, *Tritium, *Tracers, *Radioactivity techniques, Water circulation, Hydrologic data, Sea water, Mixing, Aquifer characteristics, River basins, Reservoirs, Precipitation (Atmospheric), Hydrologic cycle, Hydrogeology.
Identifiers: Hydrologic research.

Tritium is an excellent tracer for circulation of water in nature in many of its phases and is indispensable as a research tool during the Hydrologic Decade. The currently available data make it possible to study some large-scale phenomena like rate of exchange of water across the sea surface and rate of the exchange between sea surface water and deeper sea water. The hydrologic characteristics of river basins can also be studied, as well as similar characteristics of groundwater reservoirs. In these cases the characteristics, suitably defined, are revealed by the distortion of the tritium pulses in precipitation, which occur when water is passing through reservoirs. For full utilization of large-scale tritium as a tracer in hydrologic studies, it is necessary to collect data over many years. (Carstea-USGS)
W70-03894

WATER TRACING IN THE HYDROLOGIC CYCLE,
International Atomic Energy Agency, Vienna (Austria).
L. L. Thatcher.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 97-108, 1967. 12 p, 11 fig, 2 tab, 13 ref.

Descriptors: *Hydrologic cycle, *Tracers, *Radioisotopes, Tritium, Deuterium, Oxygen, Carbon, Water circulation, Groundwater movement, Pump testing, Stratified flow.
Identifiers: *Water tracing, Chemical tracers, Oxygen-18, Carbon-14.

The use of tritium, deuterium, oxygen 18, and carbon 14 to represent circulation on the continental and hemispheric scale gives new significance to the tracing of water movement through the hydrologic cycle. The traditional concept of tracers as limited tools to obtain data about micro-areas within extensive aquifers (analogous to measuring permeability on core samples to obtain the permeability of an aquifer) is outdated by the newer techniques. The tracers of interest for investigation of the hydrologic cycle are introduced on the grand scale by natural processes and fallout, and the data obtained by observing their distributions represent integrations of transport processes over large areas. Radioisotopes have also contributed to the investigation of the local or micro-aspects of the hydrologic cycle. Radioisotope tracers have been substituted for chemical tracers in groundwater velocity and direction measurements, the investigation of stratified flow, directional information from pumping tests, and similar studies. (Carstea-USGS)
W70-03900

EFFECTS OF INCONSISTENCY AND NON HOMOGENEITY ON HYDROLOGIC TIME SE RIES,
Colorado State Univ., Fort Collins. Dept. of Civ Engineering.
Vujica Yevjevich, and Raymond I. Jeng.
French resume included. Proceedings of Interna tional Hydrology Symposium, Sept 6-8, 196 Colorado State Univ, Fort Collins, Vol 1, Paper 5 p 451-458, 1967. 8 p, 5 fig, 1 tab. NSF Grant GK 169.

Descriptors: *Streamflow forecasting, *Time serie analysis, Rainfall-runoff relationships, Statistica methods, Probability, Correlation analysis
Identifiers: Hydrologic time series.

The effect of inconsistency (systematic errors) an non-homogeneity of data (which are created b man-made or natural changes in environment) o properties of hydrologic variables and time serie was investigated. It was assumed that inconsistenc and nonhomogeneity are in the form of constan and linear jumps, linear and polynomial trends, an combinations thereof. Independent variables ar used with superposed jumps and trends. Changes i probability density functions, in their mean, var ance, skewness, kurtosis, and serial correlatio coefficients were determined for various cases o jumps and trends. Inconsistency and non homogeneity introduce dependence into indepen dent time series, with the first serial correlatio coefficient becoming mainly positive. As hydrolog ic time series are often subject to inconsistency an nonhomogeneity, a portion of positive dependenc in such series comes also from these two factors apart from other basic physical processes in nature (Knapp-USGS)
W70-03905

THE BAYES METHODS OF STATISTICA HYDROLOGY (FRENCH),
Electricite de France, Chatou. Centre d Recherches et d'Essais.
J. Bernier.
English synopsis included. Proceedings of Interna tional Hydrology Symposium, Sept 6-8, 196 Colorado State Univ, Fort Collins, Vol 1, Paper 5 p 459-470, 1967. 12 p, 4 fig, 3 tab, 4 ref.

Descriptors: *Rainfall-runoff relationship *Frequency analysis, Statistical methods, Time se ries analysis, Probability, Estimating.
Identifiers: *Bayes methods, Hydrologic statistics.

Frequency analysis of rainfall-runoff data is ofte criticized because of use of incomplete informatio for the fitting of frequency curves. Bayes method are used to overcome these objections. Th methods are outlined and some practical example are given for illustration. (Knapp-USGS)
W70-03906

HYDROLOGIC EFFECTS OF RAINFALL AUG MENTATION,
Stanford Univ., Calif. Dept. of Civil Engineering.
Alan M. Lumb.
Technical Report No 116, Nov 1969. 114 p, 54 fig 5 tab.

Descriptors: *Cloud seeding, *Hydrology, *Mode studies, Computer simulation, Runoff, Floods Evapotranspiration, Soil moisture, Reservoi storage.

Computer simulation is employed to determine th hydrologic consequences of a 10 percent increas in precipitation as a result of cloud seeding. Tw assumptions concerning the time distribution of th increase are made: (1) the increase is uniformly distributed over all hours of precipitation and (2 larger percentage increases occur during hour when precipitation is low and smaller percentage increases are added to high intensity rainfall Streamflow is simulated for the period of available rainfall record on three watersheds in Nev Hampshire and California. Data on the effect o

infall increases on total runoff, interflow, groundater flow, soil moisture accumulation, actual vapotranspiration, and flood peaks are presented or the three watersheds. A relationship appears to xist between the ratio of annual runoff to recipitation and the percentage of annual rainfall iat becomes runoff and evapotranspiration. The ffect on soil moisture storage is found to be small. he increase in the mean annual flood peak and the tandard deviation of the annual flood peaks is ound to be a function of the percentage of recipitation that results in surface runoff and inerflow with larger increases when this percentage s low. The assumption as to the distribution of ainfall increases among the hours of rainfall is ound to have significant effect on flood peaks, but o have very little effect on total runoff volume or vapotranspiration. Generalized procedures are resented to permit an estimate of the hydrologic onsequences of a 10 percent increase in rainfall n any watershed if mean annual precipitation and nean annual runoff are known. It is shown that it is ossible to estimate the additional usable water obainable from a 10 percent increase in rainfall for reservoirs of various sizes on a given watershed. (Linsley-Stanford)
W70-03931

POINT RAINFALL FREQUENCIES IN CONVECTIVE STORMS,
Arizona Univ., Tucson.
Martin M. Fogel, and Lucien Duckstein.
Water Resources Research, Vol 5, No 6, p 1229-1237, Dec 1969. 9 p, 9 fig, 2 tab, 10 ref.

Descriptors: *Precipitation (Atmospheric), *Rainfall disposition, *Frequency analysis, *Rain gages, Statistical methods, Networks, Rainfall intensity, Topography, Rainfall-runoff relationships, Probability, Depth-area-duration analysis.
Identifiers: Rainfall frequency, Convective storms.

An exponential relation was developed to describe the spatial distribution of convective storm rainfall in southwestern United States. A geometric distribution was used to describe the frequencies of point rainfall depths. A Poisson distribution was assumed to represent the probability of at least one storm center occurring over a given area a specified number of times during a season. Assuming that the two probability distributions are independent and uncorrelated, maximal and minimal distributions of point rainfall depths were derived. The minimal distribution indicates that with a very high certainty a single rain gage will miss at least one convective storm a year. When compared with frequencies determined from long-term historical records, the maximal distribution exhibits a similar mean, a greater variance, and lower recurrence intervals for the higher rainfall depths. (Knapp-USGS)
W70-03673

THE APPLICATION OF ISOTOPES TO SOME PROBLEMS IN ATMOSPHERIC SCIENCES,
Atomic Energy Commission, Washington, D.C. Biology and Medicine Div.
Eugene W. Bierly.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 37-46, 1967. 10 p, 3 fig, 1 tab, 34 ref.

Descriptors: *Radioisotopes, *Tracers, *Meteorology, *Radioactivity techniques, Nuclear explosions, Atmospheric physics, Diffusion, Balloons, Mixing, Vortices, Meteorology.
Identifiers: *Nuclear meteorology, Troposphere, Stratosphere.

Isotopes have been used in tracing the global transport and diffusion of nuclear weapons debris and the motions of the stratosphere and troposphere through sampling by high altitude balloons and aircrafts. In the stratosphere, the tungsten 185 cloud indicated that large scale quasi-horizontal mixing was the dominant transport mechanism. The axes of mixing are inclined to the horizontal and follow clearly the surfaces of potential vorticity. In the troposphere, the peak concentrations in the north-south profiles of nuclear debris occur at 30 deg north or south and not at the latitude of origin, and sometimes the material is transported rapidly over great distances before being deposited on the ground. Nuclear meteorology was useful in studying exchanges between stratosphere and troposphere, and also between hemispheres. Meso- and microscale studies include: (1) Measurement of lateral and vertical diffusion coefficients of effluent flumes; (2) measurement of AgI paths when the AgI is used as a cloud-seeding agent; (3) scavenging of small particles by precipitation; and (4) deposition studies. (Carstea-USGS)
W70-03690

DIFFUSIOPHORETIC AND THERMOPHORETIC EFFECTS ON PARTICULATE MATTER NEAR CONDENSING AND EVAPORATING WATER SURFACES,
Atomic Energy Research Establishment, Didcot (England).
Phillip Goldsmith.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 55, 1967. 1 p.

Descriptors: *Radioactivity techniques, *Diffusion, *Evaporation, *Thermal properties, *Water vapor, Condensation, Soil moisture, Soil water movement, Tracers, Aerosols, Thermocline.
Identifiers: *Water vapor diffusion, Diffusiophoretic velocity, Thermophoretic velocity.

Radioactive tracer techniques have been used to study the velocity induced on submicron aerosol particles by diffusing water vapor. Similar experiments have also been made on their velocity in temperature gradients. Often in nature, diffusing water vapor is associated with a temperature gradient in the carrier gas, for instance near a cool surface on which water is condensing. Further measurements have been carried out on the superimposed diffusiophoretic and thermophoretic velocities. The role of these mechanisms in the scavenging of particulate matter from the atmosphere is discussed in the light of these experiments. (Carstea-USGS)
W70-03691

THE ATMOSPHERIC TRANSPORT OF TRITIUM,
Stockholm Univ. (Sweden). International Meteorological Inst.
Erik Eriksson.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 56-57, 1967. 2 p.

Descriptors: *Tritium, *Radioisotopes, *Tracers, *Radioactivity techniques, Precipitation (Atmospheric), Atmospheric physics, Nitrogen, Oxygen, Atmosphere, Nuclear explosions, Runoff, Mixing, Oceans, Water vapor.
Identifiers: *Tritium circulation.

Prior to 1954, tritium was derived in nature entirely from cosmic-ray interaction with nitrogen and oxygen in the atmosphere. Since 1954, considerable amounts of tritium have been injected into the stratosphere in nuclear weapons tests. Tritium circulation in nature differs rather substantially from that of water. Further, the relative intensities of deposition of water and tritium are different. The net rate of tritium deposition on land is determined to a large extent by the total runoff from land. Over ocean areas, the deposited tritium will mix with a large quantity of water which will maintain a very low concentration of tritium in water vapor. The rate of removal over oceans is very effective and roughly 3 times as large as the rate of removal by precipitation. The concentration of tritium in precipitation over oceans will be much lower than that over land. (Carstea-USGS)

HURRICANE TRITIUM I: PRELIMINARY RESULTS ON HILDA 1964 AND BETSY 1965,
Miami Univ., Fla. Inst. of Marine Science.
H. Gote Ostlund.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 58-60, 1967. 3 p, 2 fig, 1 tab, 3 ref. NSF Grant GP-4534.

Descriptors: *Hurricanes, *Radioisotopes, *Radioactivity techniques, Water vapor, Tritium, Analytical techniques, Sea water, Mixing, Tropical regions, Atmospheric physics, Tracking techniques.
Identifiers: *Hurricane Hilda, *Hurricane Betsy, Low-level counting techniques.

Airborne systems were built for sampling of liquid water and water vapor for a study of tritium distribution in and around hurricanes. Refined low-level counting techniques were developed for extremely low tritium assays and specific activities. An electrolytic enrichment system utilizing the periodic addition method is available. The air seemed to be vertically well mixed in most areas. The tritium concentration in water vapor of undisturbed tropical air is roughly 10 times higher than that of surface sea water. When this air is entrained into a hurricane, the tritium concentration decreases approaching the eye. (Carstea-USGS)

A MODEL FOR GENERATING SYNTHETIC SEQUENCES OF SHORT-TIME-INTERVAL RAINFALL DEPTHS,
Massachusetts Inst. of Tech., Cambridge.
R. A. Grace, and P. S. Eagleson.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 35, p 268-276, 1967. 9 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Rainfall, *Forecasting, *Synthetic hydrology, *Simulated rainfall, *Mathematical models, Probability, Simulation analysis, Digital computers, Computer programs, Computer models.
Identifiers: Rainfall data.

An analytical model is developed for the synthesis of short-time-interval sequences of rainfall data. The model uses the probability distribution of the time between storms and the storm duration as well as an equivalent joint distribution of storm rainfall depth and duration to generate sequences of lumped storms which retain the stochastic features of the historical storm data. The prescribed total storm depths are then distributed over their respective durations by using a special type of urn model in such a way that the short-time-increment rainfall sequences within synthetic storms possess, on the average, the same serial correlation and percentage mass characteristics as their historical counterparts. Probability distributions and storm characteristics are obtained from 10-min summer rainfall data for a period of 5 years at St. Johnsbury, Ver-

mont. These sequences are extended synthetically, and the characteristics of the synthetic storm are shown to agree adequately with the historical attributes. Not only does the model give valid results, but it does so quickly, since it is possible to compile the necessary computer programs and then generate 15 summers of lumped storms or 5 summers of 10-min data in 3 minutes. (Knapp-USGS)

FRACTURE OF LAKE AND SEA ICE,
Army Terrestrial Sciences Center, Hanover, N.H.
W. F. Weeks, and A. Assur.
Report available from Office of Naval Research, Dept of Navy, Wash, DC. Cold Regions Research and Engineering Laboratory Research Report 269, Sept 1969. 79 p, 57 fig, 1 tab, 174 ref.

Descriptors: *Ice, *Lake ice, *Ice breakup, *Bibliographies, *Reviews, Surveys, Rivers, Melting, Iced lakes, Ice jams, Mechanical properties, Water chemistry, Navigation, Sea ice.
Identifiers: Ice cracks, Fracturing (Ice), Pack ice, Ice navigation, Icebreakers (Ships).

A survey of literature on the structure of ice I and the macro- microstructure of sea and lake ice includes ice chemistry and phase relations. Recent work on the direct observation of dislocations as well as the formation of cracks in ice is summarized. Formal ice-brine-air models for analyzing variations in ice strength are also reviewed. The results of the different types of tests are discussed and compared (compressive, indentation, direct and ring-tension, small beam flexure and in situ cantilevers and simple beams, shear, and impact). Scale effects are considered as well as the rapid strength deterioration experienced by ice sheets in the spring. Finally, a number of recommendations are made concerning future research in this field. (Knapp-USGS)

SNOW ALBEDO MODIFICATION - A REVIEW OF LITERATURE,
Army Terrestrial Sciences Center, Hanover, N.H.
Charles W. Slaughter.
Cold Regions Research and Engineering Laboratory Technical Report 217, Oct 1969. 25 p, 4 fig, 10 tab, 113 ref. DA Task 1T061102B52A02.

Descriptors: *Albedo, *Snow, *Melting, Heat budget, Melting, Water management (Applied), Water yield, Water yield improvement, Snowpacks.
Identifiers: *Albedo modification.

A summary of published information on snow albedo modification is presented. Consideration of energy balance parameters includes discussion of qualitative and quantitative results of albedo modification. Practical applications of albedo modification are discussed. Snowmelt retardation methods are discussed as related to reducing soil erosion and the occurrence of flash floods from glacier meltwater. Such methods as spreading dry sand, sawdust, various debris, and the use of dense smoke from burning of leaves, straw, peat, and other material to reduce the rate of melting are cited. (Knapp-USGS)

METHODS FOR THE DETERMINATION OF MAXIMUM SNOW RESERVES IN THE RIVER BASINS OF THE CENTRAL CHERNOZEM (BLACK EARTH) BELT (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
B. L. Sokolov.
In: Sbornik Rabot po Gidrologii (Collection of Works on Hydrology), Gosudarstvennyi Gidrologicheskii Institute, Leningrad, Issue No 8, p 37-46, 1968. 10 p, 3 fig, 1 tab, 15 ref.

Descriptors: *Snow, *Snowmelt, *River basins, *Chernozems, *Snow cover, Precipitation (Atmospheric), Ice, Water supply, Maps, Forests, Land, Forecasting, Mathematical studies, Gaging stations, Frequency, Evaporation, Runoff.
Identifiers: *USSR, Central chernozem belt.

Snow reserves in the chernozem belt basins of USSR were investigated on the basis of hydrologic data recorded at 300 gaging stations and observation points. A table shows the frequencies of maximum snow resources and maps of snow accumulation in the ravines and forest areas. (Gabriel-USGS)
W70-03684

THE USE OF RADIOACTIVE TRACER GASES TO STUDY THE RATE OF EXCHANGE OF WATER VAPOR BETWEEN AIR AND NATURAL SURFACES,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Environmental Research Branch.
P. J. Barry.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 69-76, 1967. 8 p, 3 fig, 3 tab, 9 ref.

Descriptors: *Radioisotopes, *Radioactivity techniques, *Water vapor, *Tritium, Tracers, Iodine radioisotopes, Snow, Diffusivity, Diffusion, Turbulent flow, Mass transfer, Evaporation.
Identifiers: Water vapor exchange rates.

Radioactive hydrogen (tritium) as a mixed oxide with hydrogen (tritiated water or HTO) and idodine 131 have been used to measure the flux of matter at the surface of snow. The snow surface was selected because: (1) it is among the simplest of natural surfaces; (2) it is free of vegetation effects; (3) it occurs in a wide range of surface textures and roughness; (4) it is frequently renewed; and (5) an accurate sample can be collected and the radioactive tracers may be collected by melting. By using the two tracers with markedly different molecular diffusivities it was possible to study the turbulent and molecular movements separately. Comparison of experimental data with equations for calculating mass transfer rates from surface-to-air gradients showed that no existing equation predicted rates of evaporation satisfactorily. WEATHER AND DIURNAL FROZEN SOIL STRUCTURE AT CHARLOTTESVILLE, VIRGINIA,
Virginia Univ., Charlottesville.
Sam I. Outcalt.
Water Resources Research, Vol 5, No 6, p 1377-1382, Dec 1969. 6 p, 3 fig, 3 tab, 9 ref.

Descriptors: *Frost, *Weather, Virginia, Freezing, Frozen soils, Ice, Soil water movement, Soil moisture, Soil structure, Statistical methods.
Identifiers: Soil water freezing, Frozen soil structure.

The results of a field study of weather conditions and diurnal frost structures demonstrate the effect of the atmospheric environment on the structure of soils at a site where soil water content was not a limiting factor. Statistical discrimination of soil freezing and frozen soil structures is often made possible by using late afternoon sky and dew-point temperature data. An evolutionary classification of three typical frozen soil structures is also presented. (Knapp-USGS)

2D. Evaporation and Transpiration

POTENTIAL EVAPORATION AS A MANIFESTATION OF REGIONAL EVAPORATION,
Department of Energy, Mines, and Resources, Ottawa (Ontario). Hydrologic Sciences Div.
F. I. Morton.
Water Resources Research, Vol 5, No 6, p 1244-1255, Dec 1969. 12 p, 5 fig, 2 tab, 14 ref.

Descriptors: *Evaporation, *Mathematical models, Energy budget, Heat balance, Water balance, Mass transfer, Meteoric water, Meteorology, Microenvironment, Saturation, Solar radiation, Temperature, Vapor pressure, Water loss, Evaporators, Humidity, Evapotranspiration.
Identifiers: Potential evaporation.

The temperature and humidity of the lower atmosphere are treated as causes of evaporation from a small continuously moist area and as effects of evaporation from a large area with variable moisture supply. This leads to the formulation of a model in which the sum of the regional and potential evaporation is equal to the evaporation equivalent of the absorbed insolation. Such a formulation permits the regional evaporation, a product of climatic, soil moisture, and vegetation processes, to be estimated by its effects on climatologic or evaporimeter observations. Test data are derived from class A evaporation pan observations from the near-arid regions of the southwestern United States, and the near-humid regions of Ireland and from records of rainfall and runoff for Irish river catchments. Comparisons with the model predictions provide good evidence for the validity of the model and interesting insights into its hydrologic and climatologic implications. (Knapp-USGS)
W70-03676

EVAPORATION FROM LARGE DEEP LAKES,
Department of Energy, Mines and Resources, Cornwall (Ontario). Great Lakes-St. Lawrence Study Office.
F. I. Morton.
Water Resources Research, Vol 3, No 1, p 181-200, Jan 1967. 6 fig, 10 tab, 9 ref.

Descriptors: *Energy budget, *Evaporation, *Lakes, Lake Superior, Lake Ontario, Hydrology, Limnology.

entifiers: Water budget, Transitional zone, Deep kes, Shallow lakes.

erived insolation and water budget evaporation ata for Lake Superior and Lake Ontario are nalyzed in terms of both the regional and the ater surface energy balances. The results indicate at the seasonal pattern of evaporation is overned by heat storage changes, and that these hanges are closely associated with atmospheric nergy export from the lake. This finding provides physical basis for the simple empirical relationips between monthly evaporation and island-to-ainland temperature differentials that are eveloped from the water budget evaporation data. ubstantial atmospheric energy export, a concomiant of heat storage changes, reduces the energy vailable for evaporation. Therefore, evaporation rom a large deep lake is less than that from a large hallow lake under comparable climatic conditions. he analysis also provides speculative reasoning nd evidence to indicate that evaporation from a arge deep lake is closely related to the radiant heat ransfer to the sky. (Rietveld-Vanderbilt)

STOCHASTIC ASPECTS OF LAKE ONTARIO EVAPORATION,
Rutgers - The State Univ., New Brunswick, N.J.; and Cornell Univ., Ithaca, N.Y.
L. Yu Shaw, and Wilfried Brutsaert.
Water Resources Research, Vol 5, No 6, p 1256-1266, Dec 1969. 11 p, 7 fig, 5 tab, 13 ref. OWRR Project A-021-NY.

Descriptors: *Evaporation, *Lake Ontario, *Stochastic processes, Markov processes, Time series analysis, Correlation analysis, Winds, Temperature, Humidity, Energy budget, Heat balance, Water balance, Statistical models, Model studies.
Identifiers: Spectral analysis, Cross-spectral analysis.

Time series analysis was carried out on long-term monthly mean values of evaporation from Lake Ontario, which were generated in an earlier study, and on related meteorologic parameters. Correlation and spectral analyses showed that the annual cycle was dominant in all the time series. Evaporation is usually high in autumn and winter and low in spring and summer. A warming trend was observed in the air temperature and a drying trend in the relative humidity series. Except for the wind speed, no significant trend was found for the other time series. Cross correlation and cross-spectral analyses showed a close relationship between evaporation anomalies and the anomalies of the other parameters. A first order Markov model adequately described the evaporation, air temperature, and relative humidity anomalies, whereas a second order model fitted the anomalies of wind speed and water surface temperature. Morton's (1967) water budget method yields higher evaporation estimates in the summer and lower estimates in the winter than the mass transfer estimates. (Knapp-USGS)

RELATIONSHIPS BETWEEN SOIL MOISTURE ACTUAL AND POTENTIAL EVAPOTRANSPIRATION,
Department of Agriculture, Ottawa (Ontario). Plant Research Inst.
W. Baier.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan University, Nov 15-16, 1967, p 155-204, National Research Council, Ottawa, Canada, 1968. 50 p, 5 fig, 4 tab, 115 ref.

Descriptors: *Evapotranspiration, *Soil water movement, *Soil moisture, Soil types, Vegetation, Analytical techniques, Climatic data, Water balance, Energy budget, Solar radiation.
Identifiers: Actual evapotranspiration, Potential evapotranspiration.

Under natural conditions, actual evapotranspiration (AE) primarily depends on the available energy - or the atmospheric demand as reflected in the potential evapotranspiration (PE) - and the availability of soil moisture. The progress made during recent years in determining AE and PE is critically reviewed. Concepts of the relationships between PE, AE and available soil moisture for different types of soil and vegetation and for various atmospheric demand rates are examined. Emphasis is on present techniques for estimating short-term variations of PE, AE and soil moisture from readily available climatological data. Examples are given for the application of such soil moisture estimates from meteorological budgets in water balance studies and agroclimatic analysis of an area. (Carstea-USGS)

ABOUT THE ANALYTICAL METHOD FOR THE COMPILATION OF THE WATER BALANCE IN AGRICULTURE,
Palermo Univ. (Italy). Istituto di Idraulica.
Ignazio Melisenda.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 82, p 659-671, 1967. 13 p, 3 fig, 4 tab, 3 ref.

Descriptors: *Hydrologic budget, *Hydrologic data, *Data processing, *Statistical methods, Regression analysis, Evapotranspiration, Rainfall, Runoff, Water balance, Farm management.
Identifiers: Water budget computation.

Actual and potential evapotranspiration are compared and 2 numerical analyses are developed to define quantitatively their relation in 6 hydrographical basins typical of Sicily. The first analysis concerns the spreads among the annual values of evapotranspiration corresponding to the annual values of potential evapotranspiration determined for the same climatic-pedological and agricultural surroundings by means of the various formulas in use. The second analysis concerns the spreads obtained among the values of potential evapotranspiration for the dry season calculated by the application of drying process laws of different form. CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO AREAL INVESTIGATIONS AND MISCELLANEOUS ACTIVITIES,
Geological Survey, Washington, D.C. Office of Water Data Coordination.
W. W. Doyel, W. F. Curtis, and E. B. Chase.
Report available at no cost from OWDC, US Geological Survey, Wash, DC, 20242. Geological Survey Water Data Catalog, 1969. 161 p, 2 exhib, 3 tab.

Descriptors: *Data collections, *Hydrologic data, *Documentation, *Surveys, *Data storage and retrieval, Networks, Monitoring, Sampling, Instrumentation, Stations, Libraries, Investigations.
Identifiers: *Catalog of Information on Water Data.

An index is presented for use in retrieving areal investigation and miscellaneous activity data from the Catalog of Information on Water Data, a record of activities in water data collection in the U.S. The Catalog is a file of information that is accessible through data-retrieval procedures--it contains information about water-data acquisition activities but does not contain the actual data, which must be obtained from the reporting agencies. Input to the Catalog consists of information supplied by Federal, State, and local agencies that acquire water data directly in the field and laboratory. All information is stored on media suitable for data processing, supplemented by microforms and maps. Information from the Catalog (output) is made available through indexes such as this publication, which is the index to the areal investigations and miscellaneous activities section of the Catalog. The indexes help the water-data user determine the data that are available for an area and also the data available from an agency. The indexes to the 'Catalog of Information on Water Data' are indexes to separate sections of the Catalog. These indexes are designed to help the user determine what data are available that might serve his needs. (Knapp-USGS)

REDUCTION OF ANNUAL RIVER FLOWS TO LONGER PERIODS (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
A. V. Rozhdestvenskiy.
In: Sbornik Rabot po Gidrologii (Collection of Works on Hydrology), Gosudarstvennyi Gidrologicheskii Institute, Leningrad, Issue No 8, p 3-13, 1968. 11 p, 3 fig, 3 tab, 4 ref.

Descriptors: *River flow, *Mathematical studies, *Analytical techniques, *Discharge (Water), Monte Carlo method, Stochastic processes, Fluctuation, Mathematical models, Gaging stations, Discharge coefficients, Water level fluctuations, Correlation analysis.
Identifiers: *USSR, Neva River, Leningrad region, Tikhvinka River.

Flow discharges of the Neva River and Tikhvinka River, recorded in 1924-1953 and 1881-1953, respectively, were analyzed by using a cyclic oscillation method and the Monte Carlo method. Basically, the reduction of annual river discharges to a longer period is accomplished by separating the annual discharges into dynamical norms and random variations and by introducing a method of successive differences. Comparison of correlation functions, river discharge norms, and variation coefficients, derived by using initial and modulated series, indicates the reliability of the described mathematical method for the analysis of a series of

annual discharges. The reliability of the determination of a discharge dynamic norm, however, is determined by a degree of association of drainage dynamic norms of two gaging stations and their temporal stability. (Gabriel-USGS)
W70-03681

CALCULATION OF MAXIMUM DISCHARGES OF CRIMEAN RIVERS (RUSSIAN),
Kiev Hydrometeorological Observatory (USSR).
Ye. V. Khloyeva.
In: Sbornik Rabot po Gidrologii (Collection of Works on Hydrology), Gosudarstvennyi Gidrologicheskii Institute, Leningrad, Issue No 8, p 14-26, 1968. 13 p, 6 fig, 2 tab, 17 ref.

Descriptors: *Discharge (Water), *River basins, *Mathematical studies, Frequency, Floods, Gaging stations, Hydrologic properties, Watersheds (Basins), Precipitation (Atmospheric), Karst, Reservoirs.
Identifiers: *USSR, Crimean Rivers.

Because the hydrologic regimes of rivers play an important part in the selection of suitable hydrologic structures and country roads, the maximum discharges of Crimean rivers were analyzed. The Alekseyev analytical formula, modified by the author, gives the values of maximum discharges. As a function of drainage area, tributary discharge values, regulated flow coefficient, reduction index, and flow attenuation parameter. As a result of this study two empirical formulas were developed, one for mountainous areas and the other for karstic areas. (Gabriel-USGS)
W70-03682

RUNOFF VOLUME AND MAXIMUM DISCHARGES OF SPRING FLOODS APPLIED TO THE UNSTUDIED RIVERS OF KALININGRADSK REGION (RUSSIAN),
State Inst. for Planning Reservoir and Land Improvement Constructions, Leningrad (USSR).
R. Ya. Narodetskaya.
In: Sbornik Rabot po Gidrologii (Collection of Works on Hydrology), Gosudarstvennyi Gidrologicheskii Institute, Leningrad, Issue No 8, p 27-36, 1968. 10 p, 2 fig, 1 tab, 6 ref.

Descriptors: *River flow, *Discharge (Water), *Floods, *River basins, *Analytical techniques, Hydrologic aspects, Watersheds (Basins), Vegetation, Groundwater, Geology, Humidity, Dams, Snow, Precipitation (Atmospheric), Snowmelt, Frequency.
Identifiers: *USSR, Kaliningradsk region.

The hydrologic regimes of the Kaliningradsk rivers, USSR, were investigated on the basis of maximum spring flood discharge and rainfall flood data. Spring water discharges of the majority of the rivers in Kaliningradsk region exceed the rainfall flood discharges. In general, the maps of the distribution of flood-discharge simplify the evaluation of hydrologic characteristics of unstudied rivers. (Gabriel-USGS)
W70-03683

THE DETERMINATION OF LOCAL INFLOWS ENTERING A CHANNEL,
Maryland Univ., College Park.
Robert M. Ragan.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 31, p 235-243, 1967. 9 p, 5 fig, 4 ref.

Descriptors: *Routing, *Overland flow, *Hydraulic models, *Mathematical models, *Open channel flow, Numerical analysis, Synthetic hydrology, Rainfall-runoff relationships, Streamflow forecasting, Runoff forecasting.
Identifiers: *Lateral inflows.

Many recent studies have been devoted to the development of numerical solutions of the partial differential equations of free surface flow as flood routing tools. When proper measurements are made in the stream during a period of runoff, the numerical methods may also be used to compute the time and spatial distributions of the local runoff entering along the length of the channel. The advantage of the technique is that it provides a logical means of isolating land phase hydrographs for detailed study. A discussion of the approach is given and numerically generated local inflow hydrographs are compared with the lateral inflows entering along the length of a laboratory flume. The comparison showed that the approach is feasible and, in general, good agreement with the experimental data was obtained. A discussion of the sensitivities indicated by the numerical-experimental comparison is also presented. (Knapp-USGS)
W70-03699

AN ERROR MODEL FOR A SINGLE DISCHARGE MEASUREMENT,
Ontario Agricultural Coll., Guelph. School of Agricultural Engineering.
W. T. Dickinson.
French resume included. Proceeding of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 32, p 244-251, 1967. 8 p, 1 fig, 1 tab, 3 ref. Bureau of Reclamation Contract No 14-06-D-5299.

Descriptors: *Discharge (Water), *Streamflow, *Discharge measurement, *Evaluation, *Statistical methods, Theoretical analysis, Stream gages, Gaging stations, Stage-discharge relations.
Identifiers: *Error analysis.

A hypothetical error model is developed for a single stream discharge measurement. The qualitative interrelationships of various component errors, and the nature of some of these errors are investigated. In particular, the robustness of sampling techniques for vertical velocity distributions, the sampling of velocity in time, and the effect of oblique currents on current-meter response are considered. Expressions are presented for the bias and the variance of a single discharge measurement in terms of the expected values and variance of the component errors. (Knapp-USGS)

STOCHASTIC STUDY OF CHANNEL DISTRIBUTION IN RIVER BASINS,
Kyoto Univ. (Japan). Dept. of Civil Engineering.
Tojiro Ishihara, Yoshiaki Iwasa, and Takuma Takasao.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 47, p 361-369, 1967. 9 p, 4 fig.

Descriptors: *River basins, *Channels, *Stochastic processes, *Geomorphology, Channel morphology, Statistical models, Networks, Probability, Distribution patterns, Shape, Drainage density.
Identifiers: Drainage basin morphology.

The geometric structure of channel distribution in a river basin is a basic characteristic for the mathematical analysis of flood runoff as intensive hydrologic phenomena and for the quantitative evaluation of long range variations in configuration of river basin and runoff pattern. The stochastic process of the formation of channel distribution in a river basin under the action of external agency is analyzed by a model constructed in terms of the concept of order in quantitative geomorphology, the theory of geometric network, and the probabilistic approach. The mathematical analysis discloses the probabilistic characteristics of geometric quantities composing the channel distribution, and it is concluded that the channel distribution converges to three statistical laws under the equilibrium condition. (Knapp-USGS)

STATISTICAL CONSIDERATION IN RIVER MORPHOLOGY,
Institute for Water Resources, Belgrade (Yugoslavia).
Stevan Bruk, and Miodrag Bozinovic.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 48, p 370-375, 1967. 6 p, 6 fig, 2 ref.

Descriptors: *River basins, *Channels, *Stochastic processes, *Geomorphology, *Channel morphology, Statistical models, Networks, Probability, Distribution patterns, Shape, Drainage density, Sediment transport, Bed load, Alluvial channels, Meanders.
Identifiers: River basin morphology, Ergodic processes, Morava River (Yugoslavia).

The development of alluvial rivers may be considered as a stochastic process, the channel geometry being a random function of position and time. Consequently, statistical techniques must be used in the description of bed morphology, defining the channel geometry and other values by means of distribution functions and statistical moments. Autocorrelation analysis of the channel geometry leads to characteristic lengths by which the meandering can be statistically described. Admitting that the development of an alluvial bed is an ergodic and stationary process, time averages and distribution functions can be replaced by space averages and distribution functions (taken along the river), by which long term predictions of values like the average bed-load transport can be made with success. The example given refers to the Morava River in Yugoslavia. (Knapp-USGS)

PEAK DISCHARGE RELATION FOR INTER-EDIATE DRAINAGE BASINS,
een's Univ., Kingston (Ontario).
E. Watt, and R. J. Kennedy.
ater Resources Research, Vol 5, No 6, p 1406-09, Dec 1969. 4 p, 4 fig, 4 ref.

scriptors: *Peak discharge, *Flood forecasting, robability, Streamflow forecasting, Statistical thods, Frequency analysis, Routing.
ntifiers: Intermediate drainage basins, Ontario anada).

r ungaged drainage basins of intermediate size, a ak discharge-frequency relation may be deter-ned from a frequency distribution of rainfall ex-ss and a method for relating peak discharge to nfall excess. For short-period hydrographs a e-parameter peak discharge relation employing basin lag is satisfactory. Analysis of the records 45 isolated intense storms on 12 drainage basins southern Ontario provided satisfactory confir-tion of the above relation. (Knapp-USGS)

TIMATION OF STATISTICAL PARAME-RS FOR ANNUAL RIVER FLOWS,
iversidad Nacional del Zulia, Maracaibo enezuela).
acio Rodriguez-Iturbe.
ater Resources Research, Vol 5, No 6, p 1418-21, Dec 1969. 4 p, 1 fig, 2 tab, 9 ref.

scriptors: *Streamflow forecasting, *Statistical dels, Statistical methods, Markov processes, mpling, Correlation analysis, Time series analy-

ntifiers: Annual river flow series.

A first order Markov process is chosen as representative for annual river flows. The normalized standard errors of the estimates of the mean, the variance, and the first autocorrelation coefficient are shown as functions of the sample size for a river which is considered to have average statistical characteristics. The theoretical analysis is complemented with a study of the variations with sample size of the main statistical parameters of three rivers with a large amount of data. On the average between 40 and 60 years of data are desirable to estimate the mean and the variance. The normalized standard error grows rapidly with any diminishing of the sample size. Beyond this range the normalized standard error of estimate decreases slowly with lengthening sample size. Large errors appear to be common in estimating the first autocorrelation coefficient, even for series whose length is much longer than is normally found. (Knapp-USGS)

COMPARISON OF SMART AND SCHEIDEGGER STREAM LENGTH MODELS,
IBM Watson Research Center, Yorktown Heights, N.Y.
J. S. Smart.
Water Resources Research, Vol 5, No 6, p 1383-1387, Dec 1969. 5 p, 1 tab, 11 ref.

Descriptors: *Drainage patterns (Geologic), *Statistical models, Drainage density, Networks, Tributaries, Statistical methods, Geomorphology, Channel morphology.
Identifiers: *Stream length models, Stream order.

The Smart and Scheidegger stream length models are compared and shown to have similar concepts. Discrepancies in the general conclusions reached by the two authors arise from different methods of developing the models and of making comparisons with observation. The results of analysis of Scheidegger's procedures and the results of tests designed to avoid some of the difficulties encountered there fail to lend any support to the suggestion that interior link lengths increase with stream order. CONSTRAINED RANDOM WALK MEANDER GENERATION,
IBM Watson Research Center, Yorktown Heights, N.Y.
Alvin J. Surkan, and Joseph Van Kan.
Water Resources Research, Vol 5, No 6, p 1343-1352, Dec 1969. 10 p, 11 fig, 2 tab, 9 ref.

Descriptors: *Drainage patterns (Geologic), *Statistical models, *Meanders, *Stream erosion, Sediment transport, Statistical methods, Monte Carlo method, Stochastic processes, Markov processes.
Identifiers: *Random-walk models.

Analyses of meander data and comparison of models based on von Schelling's theory of random walks for isotropic Gaussian deviations yield constraints satisfactory for simulation of realistic meander paths. Runge-Kutta solutions of the differential equation for most probable paths exhibit excessive regularity. Calculation of correlation functions, transition probability matrices, and second moments for natural meander data as a function of segment direction reveals important dependency on segment ordering and shows isotropic random walk models to be untenable. Neither the directions, curvatures, nor their changes in natural meanders are Gaussian independent. Necessary constraints on random walk deviations for simulating meanders include a significant positive correlation for adjacent curvatures and directions and often a negative one between the curvature changes. Both result from azimuth dependence in the second moment of the curvature. The application of a directional property of meander curvatures makes possible (1) simulation of realistic meander paths, (2) statistical determination of flow direction, and (3) numerical evidence of a unidirectional flow origin for any meander-like path. DISTRIBUTION OF INTERIOR LINK LENGTHS IN NATURAL CHANNEL NETWORKS,
IBM Watson Research Center, Yorktown Heights, N.Y.
J. S. Smart.
Water Resources Research, Vol 5, No 6, p 1337-1342, Dec 1969. 6 p, 2 fig, 3 tab, 13 ref.

Descriptors: *Drainage patterns (Geologic), *Statistical models, Drainage density, Tributaries, Statistical methods, Geomorphology, Channel morphology.
Identifiers: Nonparametric statistics.

Interior link lengths were measured for 10 channel networks with magnitudes between 80 and 200. Nonparametric statistical methods were used to test the hypothesis that link length is independent of link magnitude. Four of the networks show no significant change (5% level) of link length with magnitude. Some of the other networks do have significant changes in link length, but the exact number depends on the nature of the alternative hypothesis. Half of the observed changes were positive and half were negative. (Knapp-USGS)

French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 81, p 648-658, 1967. 11 p, 2 fig, 1 tab.

Descriptors: *Streamflow, *Stochastic processes, Statistical methods, Statistical models, Stream gages, Data collections, Hydrologic data.
Identifiers: *England, *River Trent.

The River Trent is one of the main British rivers. The actual headwaters rise on the springs of the Millstone Grit deposits of the Upper Carboniferous System of rocks at an approximate height of 926 feet above sea level. The total length of the River

Trent from the highest headwater stream to the Trent Falls is 173.20 miles draining a total of Non-Tidal area of 3178.68 square miles through different conurbations and morphological situations. A quantitative study of some simple statistical parameters derived from the daily mean flows of the entire Trent basin is made. Qualitative inferences are drawn from these statistical parameters about the nature of the flows to be expected. Spatial and temporal variations of these parameters are shown to reflect in the corresponding behaviors of the river flows. Arguments are also initiated to relate the significance of the simple river stochastics to the existing geology of the basin. (Knapp-USGS)

GENERALIZED DROUGHT SEQUENCE PROBABILITIES FOR STORAGE-DRAFT-FREQUENCY ANALYSIS,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Hydraulic Engineering.
Desmond C. Midgley.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 57, p 443-450, 1967. 8 p, 2 fig, 8 ref.

Descriptors: *Streamflow forecasting, *Statistical methods, *Mass curves, Probability, Equations, Duration curves, Hydrographs, Rainfall-runoff relationships, Stage-discharge relations, Stream gages, Networks, Data collections, Water storage.
Identifiers: Stream gaging.

Independent deficient flow sequences of increasing duration, abstracted from the streamflow data of rivers having relatively long records, were subjected to extreme value analysis (Gumbel). The ordinates of the resulting families of annual mass curves, having recurrence interval as parameter, were rendered dimensionless by dividing by mean annual riverflow and were then generalized on a regional basis. An empirical equation was developed to describe the resulting families of critical mass curves and the characteristic constants of the equation were evaluated for several regions of South Africa. A PRINCIPAL COMPONENT ANALYSIS OF SURFACE RUNOFF DATA FROM A NEW ZEALAND ALPINE WATERSHED,
Harvard Univ., Cambridge, Mass. Dept. of Engineering and Applied Physics.
Leo M. Eiselstein.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 61, p 479-489, 1967. 11 p, 7 tab, 15 ref.

Descriptors: *Rainfall-runoff relationships, *Statistical methods, *Unit hydrographs, *Correlation analysis, Small watersheds, Antecedent precipitation, Infiltration, Evapotranspiration, Regression analysis, Synthetic hydrology, Statistical models.
Identifiers: *New Zealand, Principal component analysis.

The analysis of surface runoff data from small watersheds by principal component analysis with varimax rotation of the factor weight matrix is discussed. An example of principal component regression analysis applied to surface runoff data from an experimental watershed near Christchurch, New Zealand is presented. It is suggested that this analysis method would be suitable for correlating the surface characteristics of a small watershed with the parameters of a unit hydrograph model. Principal component regression analysis with varimax rotation of the factor weight matrix could therefore be used for the 'synthesis' of flow records for ungaged small watersheds. (Knapp-USGS)

APPLICATION OF RUNS TO HYDROLOGIC DROUGHTS,
Vermont Univ., Burlington. Dept. of Civil Engineering; and Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Richard N. Downer, M. M. Siddiqui, and V. Yevjevich.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 63, p 496-505, 1967. 10 p, 4 fig, 1 tab, 1 ref.

Descriptors: *Droughts, *Streamflow forecasting, *Rainfall-runoff relationships, *Time series analysis, Stochastic processes, Probability, Statistical methods, Statistical models, Synthetic hydrology.
Identifiers: Drought statistics, Statistical runs.

On the basis of the theory of runs, an objective definition of hydrologic drought is set forth. The definition takes into account both the duration and magnitude of the drought. Two concepts are outlined: that of the run-length, which indicates the duration of the drought; and that of run-sum, which indicates the magnitude of the drought. Once the reference value or the probability of the reference value for the drought has been selected, the definition can be objectively applied to any time series. Equations of the properties of run-length and run-sum are derived analytically for independent random variables and applied to the independent normal standard variable. The data generation method was used on the independent normal standard variable to check the analytical solutions. The comparison indicated that the data generation method was satisfactory, and it was then applied to the independent standard log-normal variable with various skewnesses to derive its properties of runs. (Knapp-USGS)

EFFECTS OF SAMPLING INTERVAL, PERIODICITY, DEPENDENCE AND SKEWNESS ON EXTREME VALUES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
David F. Kibler, and Vujica Yevjevich.
French resume included. Research sponsored by National Science Foundation. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 67, p 537-545, 1967. 9 p, 11 fig, 3 ref. NSF Grant GK-169.

Descriptors: *Streamflow forecasting, *Flood forecasting, *Statistical methods, *Probability, Sampling, Hydrographs, Duration curves, Mass curves, Time series analysis, Stochastic processes, Synthetic hydrology.
Identifiers: Extreme value theory.

In order to test the validity of extreme value theory as applied to hydrologic extremes, a study has been made of the effects of sampling interval (in which the extreme value is selected), periodicity, dependence, and skewness on the frequency distributions of extreme values. A standard normal initial distribution is first obtained by data generation techniques. Periodicity, dependence, and skewness are superimposed on the initial standard normal distribution. The Gumbel double-exponential distribution curve is then fitted to the generated extremes and distribution parameters, and dispersion index and mode are computed. Results are presented as a series of graphical plots which illustrate the distribution parameters as they vary with changing sampling intervals, harmonic amplitude, sequential dependence, and skewness in the initial distributions. CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO GROUNDWATER STATIONS,
Geological Survey, Washington, D.C. Office of Water Data Coordination.
J. R. Rapp, W. W. Doyel, and E. B. Chase.
Report available at no cost from OWDC, US Geological Survey, Wash, DC, 20242. Geological Survey Water Data Catalog, 1969. 657 p, 1 fig, 1 exhib, 4 tab.

Descriptors: *Data collections, *Hydrologic data, *Documentation, *Surveys, *Groundwater, Water wells, Data storage and retrieval, Networks, Monitoring, Sampling, Instrumentation, Stations, Libraries, Investigations.
Identifiers: *Catalog of Information on Water Data.

An index is presented for use in retrieving data on groundwater measuring stations, from the Catalog of Information on Water Data, a record of activities in water data collection in the U.S. The Catalog is a file of information that is accessible through data-retrieval procedures--it contains information about water-data acquisition activities but does not contain the actual data, which must be obtained from the reporting agencies. Input to the Catalog consists of information supplied by Federal, State, and local agencies that acquire water data directly in the field and laboratory. All information is stored on media suitable for data processing, supplemented by microforms and maps. Information from the Catalog (output) is made available through indexes such as this publication, which is the index to the groundwater section of the Catalog. The indexes help the water-data user determine the data that are available for an area and also the data available from a reporting agency. The indexes to the 'Catalog of Information on Water Data' are indexes to separate sections of the Catalog. These indexes are designed to help the user determine what data are available that might serve his needs. In this index to groundwater stations, the stations are grouped (1) by States, (2) by counties within the States, and (3) by agencies within the counties. (Knapp-USGS)

BIBLIOGRAPHY OF THE GROUNDWATER RESOURCES OF NEW YORK THROUGH 1967,
Geological Survey, Albany, N.Y.
R. D. MacNish, R. C. Heath, L. E. Johnson, R. A. Wilkens, and R. D. Duryea.
New York State Water Resources Commission Bulletin 66, 1969. 186 p, 3 fig, 2 index.

Descriptors: *Bibliographies, *Groundwater, *New York, *Water resources, Water supply, Aquifers, Water wells, Water resources development, Water levels, Surveys, Data collections, Hydrologic data, Information retrieval.
Identifiers: Water Resources Bibliography.

A bibliography lists the groundwater resources studies in New York through 1967. Considerable information concerning New York water-bearing strata is available in a large variety of publications. The purpose of this bibliography is to list all these references in a single publication as an aid to future studies of New York's groundwater resources. In addition to the annotated bibliography, which summarizes the contents of each reference, a large part of the report is allocated to location and subject indexes of the references. The location index allows the reader to look under a specific area and find all publications dealing with any aspect of the groundwater resources of that area. The subject index permits the reader to look under the principal subjects related to groundwater resources and find material

related to areas in New York published on a specific subject. Published reports on the groundwater resources of New York range from detailed reports on small areas to general reports covering the entire State. (Knapp-USGS)

COMPILATION OF RESULTS OF AQUIFER TESTS IN TEXAS,
Geological Survey, Austin, Tex.
B. N. Myers.
Report published and distributed by the Tex Water Development Bd, P.O. Box 12386, Austin, Tex, 78711. Texas Water Development Board Report 98, July 1969. 532 p, 4 fig, 1 tab, 8 ref.

Descriptors: *Aquifers, *Texas, *Specific capacity, *Aquifer characteristics, *Data collections, Hydrologic data, Permeability, Drawdown, Transmissivity, Hydrologic properties, Documentation, Information retrieval.
Identifiers: *Aquifer testing, Pumping tests.

Aquifer tests made in Texas are compiled and evaluated. Some of the tests were conducted with little or no prior knowledge of the geologic framework of the aquifer; consequently, the reliability of such tests was questionable. However, on the basis of additional field testing or supporting geologic data, a few of the initially calculated results (some of which have been published) were revised. The form in which the material is presented is probably complete enough to permit the user of the data to reevaluate the results or make other interpretations. The data are grouped by county and where possible the latitude and longitude of the well are given. (Knapp-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF OCEAN COUNTY, NEW JERSEY,
Geological Survey, Trenton, N.J.
Henry R. Anderson, and Charles A. Appel.
New Jersey State Division of Water Policy and Supply Special Report 29, 1969. 93 p, 29 fig, 10 tab, 20 ref.

Descriptors: *Water resources, *Aquifers, *Groundwater, *New Jersey, Water yield, Water levels, Water quality, Water supply, Artesian wells, Water wells, Data collections, Hydrologic data, Hydrogeology.
Identifiers: Ocean County (NJ).

The aquifers of Ocean County, New Jersey, are continental, near-shore marine, beach, or deltaic deposits of porous sand and gravel; the confining beds are chiefly deeper water marine deposits of clay and glauconite. Generally, the Coastal Plain formations are more permeable near their outcrop, where shallow-water deposits occur, than downdip where marine clays and glauconites occur. Groundwater in Ocean County is obtained principally from four artesian aquifer systems and a water-table aquifer. The formations of Cretaceous age form an artesian aquifer system 600 to 2,000 feet thick. Well yields of 500 to 1,000 gpm can be expected. Potable water in the aquifer system is soft (29 to 51 ppm hardness) and is generally high in iron content (0.66 to 3.2 ppm). Temperatures of 70 to 90 deg F make the water less desirable than shallow water for cooling purposes. (Knapp-USGS)

HYDROLOGIC RECONNAISSANCE OF SKULL VALLEY, TOOELE COUNTY, UTAH,
Geological Survey, Salt Lake City, Utah; and Utah Dept. of Natural Resources. Div. of Water Rights.
J. W. Hood, and K. M. Waddell.
Utah Department of Natural Resources, Technical Publication No 18, 1968. 57 p, 11 tab, 8 fig, 34 ref, 2 maps.

Descriptors: *Arid lands, *Utah, *Groundwater, *Evapotranspiration, *Water quality, Groundwater basins, Groundwater recharge, Precipitation (Atmospheric), Groundwater movement, Water chemistry, Water yield, Hydrologic budget, Wells, Surface waters, Hydrogeology, Surveys.
Identifiers: *Skull Valley (Utah).

Skull Valley is about 50 miles long extending northward from Lookout Pass to the Great Salt Lake. The main groundwater supply underlies about 230,000 acres of unconsolidated rocks of the late Tertiary and Quaternary. All water input is precipitation, most of which falls on the surrounding mountains. Total annual estimated recharge ranges from 30,000 to 50,000 acre feet of which about 80 to 90% is lost to evapotranspiration. Perennial groundwater yield is estimated at 10,000 acre feet or less. Water quality is generally very poor with dissolved solids ranging up to 17,000 ppm. An estimated one million acre feet is of quality suitable for irrigation or domestic use. Most of this lies under the alluvium bordering the mountains on the south and eastern sides of the valley. (Crouse-Arizona)

ANISOTROPIC PERMEABILITY OF FRACTURED MEDIA,
Colorado School of Mines, Golden.
David T. Snow.
Water Resources Research, Vol 5, No 6, p 1273-1289, Dec 1969. 17 p, 5 fig, 5 plate, 32 ref.

Descriptors: *Permeability, *Anisotropy, *Porous media, *Fractures (Geology), *Mathematical models, Model studies, Darcys law, Statistical models, Mathematical studies, Discharge (Water), Flow, Groundwater movement.
Identifiers: Anisotropic permeability, Fractured porous media.

The mathematical equivalents of parallel plate openings are used to simulate real fractures dispersed in orientation, distributed in aperture, and of arbitrary spacing. The discharge of each conductor is a second rank tensor proportional to the cube of aperture and to the projection of a hydraulic gradient generally parallel to no conductor. Components of discharge through each intersecting conductor and components of discharge through intervening pervious blocks may be added. The reciprocal of specific surface of the fracture system is a weighting factor for the tensor sum, which is the anisotropic Darcy's law permeability of an equivalent continuous medium. Special cases of one, two, and three joint sets are modeled by applying Monte Carlo methods to pair orientations of individual planes sampled from Fisher dispersions with apertures sampled from skewed normal distributions. Statistics of the orientation of principal axes and of principal permeabilities are developed to show the relationship between joint geometry and anisotropy and to assess its variations. (Knapp-USGS)
W70-03870

DETERMINING SPECIFIC YIELD OF THE OGALLALA AQUIFER BY THE NEUTRON METHOD,
Agricultural Research Service, Bushland, Tex. Southwestern Great Plains Research Center.
Ordie R. Jones, and Arland D. Schneider.
Water Resources Research, Vol 5, No 6, p 1267-1272, Dec 1969. 6 p, 5 fig, 2 tab, 10 ref.

Descriptors: *Specific yield, *Aquifers, *Alluvium, *Nuclear moisture meters, Texas, Instrumentation, Surveys, Radioactivity, Water levels, Water level fluctuations, Permeability.
Identifiers: Ogallala Formation, Neutron moisture meters, Pumping tests, Aquifer testing.

The specific yield of the Ogallala formation, a water table aquifer, was determined with a neutron moisture meter. An access tube penetrated a 12-foot section of the aquifer. This section was saturated by recharging water to the aquifer and then dewatered by pumping for 11 days. The specific yield of the aquifer was calculated from neutron moisture measurements made at saturation after most gravity drainage had occurred. The average specific yield for 25 measurements made at 1/2-foot intervals was 0.22. This value compares favorably with the specific yields determined by tracer techniques and laboratory analysis of cores. However, the specific yield determined by the neutron method was 50% greater than the specific yield determined by pumping tests. (Knapp-USGS)
W70-03871

AVAILABILITY OF GROUNDWATER IN WAYNE COUNTY, IOWA,
Geological Survey, Iowa City, Iowa.
J. W. Cagle.
Iowa Geological Survey Water Atlas No 3, 1969. 33 p, 10 fig, 6 tab.

Descriptors: *Water resources, *Water quality, *Groundwater, *Aquifers, *Iowa, Nitrates, Saline water, Water chemistry, Water supply, Water yield, Water wells, Water pollution sources, Geology, Glacial drift.
Identifiers: Wayne County (Iowa).

Information is presented on the availability and quality of groundwater in Wayne County, one of several counties in southern Iowa affected by a shortage of good-quality water. Only locally and in limited areas, or only after extensive water-quality treatment, are suitable supplies of groundwater

available to satisfy the water needs. Bedrock aquifers yield variable small amounts of moderately to highly mineralized water. Surficial aquifers comprising glacial drift and alluvium are estimated to yield up to 45 gpm in some areas; an availability map indicates the areas where water supplies can be developed. Dissolved-solids concentrations range from about 470 mg/l in the alluvium to over 3,600 mg/l in the deep (more than 100 feet) glacial drift. Many shallow (100 feet or less) supplies presently in use contain high concentrations of nitrate and chloride, and these concentrations are attributed to localized contamination. Wells in the alluvium and shallow drift that are properly constructed and located are expected to yield satisfactory quality water. (Knapp-USGS)
W70-03879

RADIOCARBON DETERMINATIONS APPLIED TO GROUNDWATER HYDROLOGY,
Geological Survey, Washington, D.C.; and Geological Survey, Denver, Colo.
Bruce B. Hanshaw, Meyer Rubin, and William Back.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 117-118, 1967. 2 p, 3 ref.

Descriptors: *Carbon radioisotopes, *Radioactive dating, *Groundwater movement, *Tracking techniques, *Tracers, Acidity, Alkalinity, Carbonates, Carbon dioxide, Groundwater recharge, Saturation, Carbon, Water chemistry, Geohydrologic units, Hydrogeology.
Identifiers: *Groundwater hydrology.

Field determination of pH, alkalinity and the use of stable isotopes can correct some chemical problems associated with use of radiocarbon in hydrology. These chemical problems are: (1) Determination of initial C-14 levels in the recharge area; (2) water saturation with respect to carbonate minerals; (3) isotopic exchange after saturation is attained; and (4) introduction of carbon dioxide from noncarbonate sources. The amount of nonradiogenic carbon introduced into groundwater can be determined by taking advantage of the range of C-13 values in nature. Atmospheric carbon dioxide is depleted only slightly in C-13, whereas plants, wood and coal are quite depleted in C-13. In contrast, carbon dioxide from thermal areas is commonly much enriched in C-13. In aquifers that contain carbonate minerals, the C-13 correction can be applied to determine the amount of nonradiogenic carbon dilution in order to correct the raw C-14 age and calculate a corrected C-14 age. Field studies have been conducted in selected aquifers (1) to measure the relative C-14 concentrations and C-13 values; (2) distinguish between the waters from different geohydrologic environments; (3) calculate velocity of groundwater movements; and (4) delineate areas of significant recharge. USE OF CHEMICAL AND RADIOACTIVE TRACERS AT THE NATIONAL REACTOR TESTING STATION, IDAHO,
National Reactor Testing Station, Idaho Falls, Idaho.
Donald A. Morris.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 130-142, 1967. 13 p, 11 fig, 3 tab, 4 ref.

Descriptors: *Radioactivity techniques, *Tracers, *Tritium, *Groundwater movement, *Tracking techniques, Idaho, Waste disposal, Nuclear reactors, Flow rates, Aquifers, Basalts, Dye releases, X-ray fluorescence, Hydrogeology.
Identifiers: *National Reactor Testing Station, Chemical tracers, Radioactive tracers.

Chemical and radioactive tracers were used in studies of the geology and the hydrology of the basalt terrane at the National Reactor Testing Station. A salt tracer, used near waste disposal from the Idaho Chemical Processing Plant, indicated rates of flow ranging from 15 to 50 ft/day in the regional groundwater reservoir, and a sodium fluorescein dye indicated an average rate of flow of about 23 ft/day. Recent studies using tritium indicated average rates of flow of about 54 ft/day based on first arrival and from 10 to 13 ft/day based on the arrival of the center of mass or maximum tritium concentration. Studies of the water perched in the alluvium and basalt underlying the Test Reactor Area indicated a rate of flow of about 2-10 ft/day. Long-range tritium studies in the regional groundwater reservoir in the Central Facilities Area indicated rates of flow of 6-8 ft/day under normal hydraulic gradients of 5 ft/mile at distances of 4-5 miles from points of injection. RADIOCARBON AGES OF GROUNDWATER IN AN ARID ZONE UNCONFINED AQUIFER,
Instituto Venezolano de Investigaciones Cientificas, Caracas.
M. A. Tamers.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 143-152, 1967. 10 p, 2 fig, 3 tab, 17 ref.

Descriptors: *Carbon radioisotopes, *Radioactive dating, *Aquifer characteristics, Carbonates, Carbon dioxide, Bicarbonates, Groundwater recharge, Saline water intrusion, Water supply, Water resources development, Arid climates.
Identifiers: *Venezuela, *Maracaibo, *Groundwater dating.

The use of the naturally occurring stable isotope C-13 was studied to estimate the amount of limestone that has dissolved in groundwater. Limestone contains essentially no C-14, and has 2.5% more C-13 than plants and 0.8% more than atmospheric carbon dioxide. Advantage can be taken of these differences in C-13 to estimate the contribution of dissolved carbonate derived originally from limestone. The dissolved carbon dioxide and bicarbonate content in the groundwater aquifer of the city of Maracaibo, Venezuela, were used for radiocarbon dating. The radiocarbon activities were corrected for the dilution of the activity by limestone. The experimental results suggest that the groundwater aquifer is not being recharged and at the present rate of water consumption, the supply could last 350 years. If population growth is taken into consideration, the groundwater aquifer would be exhausted in less than 80 years. The probability of sea water intrusion into the aquifer is discussed (Carstea-USGS)

TECHNIQUES OF GROUNDWATER TRACING USING RADIONUCLIDES,
Atomic Energy of Canada Ltd., Chalk River (Ontario).
W. F. Merritt.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 169-170, 1967. 2 p, 2 ref.

Descriptors: *Tracers, *Groundwater movement, *Radioisotopes, Tracking techniques, Tritium, Gamma rays, Analytical techniques, X-ray analysis, Carbon radioisotopes, Iodine radioisotopes, Phosphorous radioisotopes.
Identifiers: *Groundwater tracing, Liquid scintillation.

Radionuclide techniques commonly used for tracing groundwater are discussed. Tritium is cheap, easy to handle and moves with groundwater, but is difficult to count. Pure beta emitters (Sr-35, P-32, C-14) are easy to count, but the last two may be fixed by soil bacteria. Gamma emitters (Br-82, I-131) can be detected in the field but may require shielding during handling. Liquid scintillation, windowless flow proportional, and well-type crystal counting methods were compared. Techniques for measuring the direction and velocity of groundwater flow used at Chalk River Nuclear Laboratories are given. (Carstea-USGS)

THE USE OF A TRACER TEST TO VERIFY AN ESTIMATE OF THE GROUNDWATER VELOCITY IN FRACTURED CRYSTALLINE ROCK AT THE SAVANNAH RIVER PLANT NEAR AIKEN, SOUTH CAROLINA,
Geological Survey, Aiken, S.C.
I. Wendell Marine.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 171-179, 1967. 9 p, 9 fig, 1 tab, 8 ref.

Descriptors: *Tracers, *Crystalline rocks, *Groundwater movement, *South Carolina, Structural geology, Observation wells, Tritium, Radioisotopes, Radioactivity techniques, Radioactive wastes, Waste storage, Fractures (Geology), Tunnels.
Identifiers: *Savannah River, Groundwater velocity, Schist, Gneiss.

The storage of high-level radioactive wastes in unlined tunnels excavated in crystalline rock about 1500 feet beneath the surface was found to be technically feasible at the Savannah River Plant, South Carolina. Most of the crystalline rock consists of schist and gneiss and is nearly impermeable, with very few fractures. Estimates of the natural groundwater velocity were 0.5 ft/yr in nearly impermeable rock and 5.4 ft/yr for zones of more open fractures. The validity of these hydraulic estimates was tested by using tritium as a tracer and in pumping and swabbing tests in observation wells. The peak concentration of tritium was reached in about one year, yielding an average groundwater velocity of 1,760 ft/yr. The predicted average velocity for the tracer was 320 ft/yr which is 2.5

times lower than the measured velocity. (Carstea-USGS)

2G. Water in Soils

INFILTRATION INDUCED SOIL INSTABILITIES,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
Donald Dean Adrian.
Groundwater, Vol 8, No 1, p 29-36, Jan-Feb 1970. 8 p, 6 fig, 7 ref. PHS Grant WP-0026 and FWPCA Grant 17070-DZS.

Descriptors: *Infiltration, *Percolation, *Capillary action, Soil water movement, Model studies, Hydraulic models, Infiltrometers, Permeameters, Hydraulic conductivity, Permeability.
Identifiers: Infiltration stability, Soil air movement.

Theoretical analyses predicted and experimental observations confirmed a mechanism by which strong capillary forces hindered instead of helped promote infiltration into soils. Infiltration into an unsaturated soil overlying an impermeable barrier displaces the air from the soil interstices. Unable to escape downward, the air may escape upward in bubbles traveling through large pores, or, if the pores are small and the capillary forces are large, the air is compressed between the wetting front and the barrier. This reduces the infiltration rate and may result in an almost stable wetting front. Under certain calculable conditions the air pressure build-up is sufficient to cause rupturing of the soil, forming a cavity. The air-filled cavity breaks the flow passages and percolation ceases through pores terminating in the cavity. Grain size and packing play a role by limiting the capillary pressure build-up and the bubbling pressure. (Knapp-USGS)

FIELD MEASUREMENT AND USE OF SOIL-WATER PROPERTIES,
Oklahoma State Univ., Stillwater.
J. M. Davidson, L. R. Stone, D. R. Nielsen, and M. E. LaRue.
Water Resources Research, Vol 5, No 6, p 1312-1321, Dec 1969. 10 p, 16 fig, 4 tab, 15 ref.

Descriptors: *Soil water movement, *Hydraulic conductivity, *Moisture content, *Hysteresis, On-site tests, Mathematical studies, Darcy's law, Drainage, Capillary action, Capillary conductivity.
Identifiers: Hydraulic conductivity-water content relations.

The hydraulic conductivity versus soil-water content relation for different soil depths was measured in the field for three soil profiles. The soils varied in physical properties from homogeneous to heterogeneous with depth and from loamy sand to silty clay in surface soil texture. Hydraulic conductivity values calculated from drainage data taken during different time intervals compared favorably with each other and showed no measurable hysteresis. The soil-water flux at various soil depths with and without evaporation at the soil surface was measured. The rate at which water drained from each of the profiles was predicted using Darcy's equation and some simplifying assumptions. The agreement between theoretical and measured results is discussed in terms of soil heterogeneity with depth. (Knapp-USGS)

DOWNWARD MOVEMENT OF SOIL MOISTURE TRACED BY MEANS OF HYDROGEN ISOTOPES,
Heidelberg Univ. (West Germany). Physics Inst., C-14 Lab.
U. Zimmermann, K. O. Munnich, and W. Roether.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 28-36, 1967. 9 p, 5 fig, 1 tab, 18 ref.

Descriptors: *Soil moisture, *Soil water movement, *Deuterium, *Tracers, Hydraulic gradient, Permeability, Analytical techniques, Evapotranspiration, Groundwater recharge, Hygroscopic water, Hydrologic budget, Water balance.
Identifiers: *Downward soil moisture movement, Labeled water.

Experiments using deuterium confirmed the layered movement of soil moisture. Surfaces of 4 sq meters representing two German soils were 'rained' with about 5 mm of water containing 1.5% deuterium oxide. Soil samples were collected periodically to trace the downward movement of the labeled water. This labeled layer had a distinguishable boundary between the older and younger rainwater in soil. The water supply and not the hydraulic gradient and permeability is the limiting factor of water movement in unsaturated soils. The following systematic errors are listed and briefly discussed: (1) the depth of water movement may vary according to soil irregularities; (2) tagged water may be bypassed in both directions; (3) the standard moisture determination does not take into account the very strongly bound water which may be capable of isotopic exchange. Isotope tracing provides a method to calculate a balance between the amount of rainfall after the date of tagging and the fraction of this rain that is still present in soil. The difference is considered to be lost by evapotranspiration. (Carstea-USGS)

YIELD-PROTEIN RELATIONSHIPS IN WHEAT GRAIN, AS AFFECTED BY NITROGEN AND WATER,
Nebraska Univ., Lincoln.
G. L. Terman, R. E. Ramig, A. F. Dreier, and R. A. Olson.
Agronomy Journal, Vol 61, No 5, p 755-759, Sept-Oct 1969. 6 fig, 17 ref.

Descriptors: *Crop production, *Moisture availability, *Nitrogen, *Plant growth, *Proteins, Semiarid climates, Wheat, Moisture stress, Irrigation, Dry farming, Water, Nebraska, Soil moisture, Soil-water-plant relationships, Crop response.

The effect of applied nitrogen on wheat yield and protein under different moisture conditions was tested in semiarid Nebraska. Applied nitrogen increased total yield if adequate soil moisture was available. Under dryland farming conditions where the wheat was subject to severe moisture stress, there was little or no increase in yield but there was a significant increase in protein content. In general percentage of protein decreased as yields increased, but the level of protein at the different yield rates was increased with adequate irrigation. Moisture supply appeared to be the chief factor determining response to applied nitrogen. (Crouse-Arizona)

SOIL RESPIRATORY ACTIVITY AND ORGANIC MATTER DEPLETION IN AN ARID NEVADA SOIL,
Nevada Univ., Reno.
S. D. Lyda, and G. D. Robinson.
Soil Science Society of America, Proceedings, Vol 33, No 1, p 92-94, 1969. 1 tab, 3 fig, 12 ref.

Descriptors: *Soil treatment, *Respiration, *Soil microorganisms, *Organic matter, *Arid lands, Nevada, Microenvironment, Metabolism, Oxygen requirements, Sudangrass, Oats, Alfalfa, Soil amendments, Manometers, Oxygen, On-site investigations, Soil environment, Sampling.
Identifiers: *Crop residues.

High correlations have been observed between soil respiratory activity and actual microbial counts. During a 4 year period mature crop residues of alfalfa, oats, and sudan have been incorporated in an irrigated sandy loam in arid southern Nevada in an attempt to reduce Phymatotrichum root rot. This paper presents the results of this operation in the field for 2 years as well as supporting laboratory studies of the same residues at various amendment rates. In the field a close relationship was noted between respiration rate and organic matter content which decreased slowly over a 6-month period. In the laboratory the same residues were added at the 1, 2, 3, and 4% by weight levels. Maximum activity was noted during the first 2 weeks for the 2, 3, and 4% levels. Respiration rate was proportional to residue concentration. However, increments were not additive. The results suggest that a given soil could become saturated with organic matter and at that point other factors would become limiting on respiration, such as available oxygen or accumulation of metabolic products. (Crouse-Arizona)

ROOTZONE SALT PROFILES AND ALFALFA GROWTH AS INFLUENCED BY IRRIGATION WATER SALINITY AND LEACHING FRACTION,
Agricultural Research Service, Riverside, Calif. Soil and Water Conservation Research Div.; and Agricultural Research Service, Riverside, Calif. Salinity Lab.
C. A. Bower, G. Ogata, and J. M. Tucker.
Agronomy Journal Vol 61, No 5, p 783-785, Sept-Oct 1969. 1 tab, 3 fig, 2 ref.

Descriptors: *Arid lands, *Irrigation water, *Drainage water, *Saline water, *Plant growth, Saline soils, Lysimeters, Alfalfa, California, Root zone, Soil-water-plant relationships.

Alfalfa was grown in 24 lysimeters at Riverside, California, with 12 irrigation water salinity and leaching fraction treatments. Plant yield was related to the salinity that developed in the root zone. The first increments of leaching were most effective in preventing salt accumulation in the soil. At high leaching fractions much of the water applied beyond that required for evapotranspiration was of little effect in lowering soil salinity. (Crouse-Arizona)

VAPOR LOSSES THROUGH SOIL MULCH AT DIFFERENT WIND VELOCITIES,
Punjab Agricultural Univ., Hissar (India). Dept. of Soils.
C. L. Acharya, and S. S. Prihar.
Agronomy Journal, Vol 61, No 5, p 666-669, Sept-Oct 1969. 3 tab, 3 fig, 6 ref.

Descriptors: *Mulching, *Evaporation control, *Porosity, *Water vapor, *Wind velocity, Soil moisture, Evaporation, Laboratory tests, Soil physical properties, Vapor pressure, Arid lands.
Identifiers: *India, Mulch porosity, Mulch thickness, Vapor loss.

When intervals between irrigations are long, the soil surface dries and a large proportion of moisture loss occurs in vapor form through the dry surface layer. The authors report a laboratory study to determine rate of vapor losses with different wind velocities and mulch porosities. The soil was a sandy loam and the mulch was prepared from a sandy loam treated with water repellent polyvinyl alcohol. The ratio of evaporation through a dry layer to that from a continuously wet surface was a function of the thickness of the dry layer over a cer-

tain range. Within this range the vapor loss could be expressed with a regression equation as a function of wind velocity and porosity of the mulch. (Crouse-Arizona)

SOIL FACTORS INFLUENCING PERCOLATION TEST PERFORMANCE,
Pennsylvania State Univ., University Park. Dept. of Soil Science.
B. D. Derr, R. P. Matelski, and G. W. Petersen.
Soil Science Society America Proceedings, Vol 33, No 6, p 942-946, Nov-Dec 1969. 5 p, 5 tab, 19 ref.

Descriptors: *Soil water movement, *Percolation, Statistical methods, Percolating water, Soil environment, Clays, Silts, Soil texture, Slopes, Drainage.
Identifiers: Drainage classes, Fragipans, Subsoil consistence, Percolation tests.

Percolation rates were measured at 250 sites in Pennsylvania. Statistical analysis of the data showed that there was considerable variation between percolation test rates within sites. The variability of individual tests between sites on the same soil series is generally greater than the variability of individual tests within sites. The clay contents and drainage classes were negatively correlated. The silt content and coarse fragments of the subsoil were positively correlated. Drainage classes, fragipans, subsoil texture, surface coarse fragments, type and grade of subsoil structure, parent material, and slope classes were significantly related to percolation rates. Moderately well, somewhat poorly, and poorly drained soils were influenced by moist subsoil consistence, fragipans, subsoil structure grade, and subsoil texture. Soil drainage classes are closely related to percolation rates. (Carstea-USGS)

NUMERICAL METHOD FOR ESTIMATING SIMULATANEOUS FLOW OF WATER AND SALT IN UNSATURATED SOILS,
Colorado State Univ., Fort Collins. Dept. of Soil Sciences; and Utah State Univ., Logan. Dept. of Soils and Meteorology.
E. Bresler, and R. J. Hanks.
Soil Science Society America Proceedings, Vol 33, No 6, p 827-832, Nov-Dec 1969. 6 p, 5 fig, 13 ref. OWRR Project B-008-COLO.

Descriptors: *Unsaturated flow, *Model studies, *Soil water movement, Numerical analysis, Mathematical studies, Saline soils, Infiltration, Evaporation, Water distribution (Applied), Diffusion, Ion exchange, Fertilizers, Herbicides, Pesticides, Water chemistry.
Identifiers: Unsaturated soils, Salt distribution.

A numerical solution of noninteracting salt flow simultaneously with water in unsaturated soil was devised and programmed. Solutions were obtained for infiltration, redistribution, and evaporation under different wetting and boundary conditions. The effect of diffusion on salt distribution was neglected in the computations. The method was found to give reasonable results for noninteracting solutes. When compared with measured total salt distribution after one wetting and drying cycle, the model gave fairly good results when a source term was added to the computations. The method can be applied to some practical problems, such as leaching of salts and fertilizer movement. (Carstea-USGS)
W70-03851

INFILTRATION, REDISTRIBUTION, AND SUBSEQUENT EVAPORATION OF WATER FROM SOIL AS AFFECTED BY WETTING RATE AND HYSTERESIS,
Colorado State Univ., Fort Collins. Dept. of Soil Science; and Utah State Univ., Logan. Dept. of Soils and Meteorology.
E. Bresler, W. D. Kemper, and R. J. Hanks.
Soil Science Society America Proceedings, Vol 33, No 6, p 832-840, Nov-Dec 1969. 9 p, 10 fig, 1 tab, 15 ref. OWRR Project B-008-COLO.

Descriptors: *Soil water movement, *Water transfer, *Soils, Columns, Infiltration, Wetting, Evaporation, Hysteresis, Flow, Moisture content.
Identifiers: *Soil columns, Water suction.

Soil columns were wetted at three different rates which caused unequal water content profiles during infiltration. Hysteresis in soil water content-water suction relationships has a larger effect on water redistribution as the wetting rate increases. The effect tends to keep the water content higher and the zone of wetting shallower during the redistribution stage when rates of wetting are faster. At any given redistribution time, higher water content and lower wetting depth cause the subsequent evaporation to be greater. Evaporation was directly related to the previous wetting rates. The experimental results are in agreement with the results of numerical solution to water flow equations. (Carstea-USGS)

COMPARISON OF COMPUTED AND MEASURED MOISTURE REDISTRIBUTION FOLLOWING INFILTRATION,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
W. J. Staple.
Soil Science Society America Proceedings, Vol 33, No 6, p 840-847, Nov-Dec 1969. 8 p, 10 fig, 1 tab, 22 ref.

Descriptors: *Moisture content, *Soil water movement, *Infiltration, Particle size, Hydraulic conductivity, Hysteresis, Soils, Diffusivity.
Identifiers: Water-holding capacity, Tension curves, Soil water redistribution.

Redistribution of water was measured in three soils following two different initial amounts of infiltration. The measured redistribution profiles were compared with those computed from the flow equation taking into account hysteresis in the drying tension vs water content relationship. Agreement between measured and computed moisture profiles was considered satisfactory. A procedure was outlined for determining wetting diffusivities and conductivities in the wetting front on the basis of soil moisture profiles obtained during redistribution. The different shapes of the drying scanning tension curves provided some insight into the differences in particle size distribution that influence the water-holding capacity of soils. (Carstea-USGS)

THERMO-OSMOSIS THROUGH COMPACTED SATURATED CLAY MEMBRANES,
Gulf Research and Development Co., Pittsburgh, Pa.
C. Dirksen.
Soil Science Society America Proceedings, Vol 33, No 6, p 821-826, Nov-Dec 1969. 6 p, 1 fig, 5 tab, 26 ref.

Descriptors: *Osmosis, *Membranes, *Soil water movement, *Water chemistry, Permeability, Hydraulic properties, Kaolinite, Bentonite, Sodium, Temperature, Flow, Unsaturated flow, Clays.
Identifiers: *Clay membranes, Thermo-osmosis, Na-kaolinite, Na-bentonite.

Hydraulic permeability of saturated Na-kaolinite decreased more rapidly with increasing compaction pressure than did thermo-osmotic permeability. This resulted in a moderate increase of thermo-osmotic pressure difference. Sodium bentonite showed a decrease in the thermo-osmotic pressure difference at a compaction pressure of 7.0 kg/sq cm. At the same time, the thermo-osmotic permiability increased with increasing average temperature. Thermal flow of water occurred from the warm to the cold side and was generally less than that reported for liquid water in unsaturated solids. The apparent activation energy of thermo-osmotic water transport in Na-bentonite was estimated to be about 29 cal/g water; the heat of transport was more than 3 orders of magnitude smaller. (Carstea-USGS)
W70-03859

INFILTRATION RATES AS AFFECTED BY DESERT VEGETATION,
Arizona Univ., Tucson.
Forest P. Lyford, and Hasan K. Qashu.
Water Resources Research, Vol 5, No 6, p 1373-1376, Dec 1969. 4 p, 3 fig, 3 tab, 4 ref. OWRR Project A-012-ARIZ.

Descriptors: *Infiltration, *Vegetation effects, *Arid lands, Soil-water-plant relationships, On-site tests, Soil water movement.
Identifiers: Paloverde, Creosote bush.

Infiltration of water into two soils measured at radial distances from the stems of paloverde (Cercidium microphyllum) and creosote bush (Larrea tridentata) were found to average nearly three times greater under plants than in the openings. Bulk density was lower and organic matter content was higher in topsoil under plants than in the openings. (Knapp-USGS)
W70-03864

EVALUATION OF FLOW PARAMETERS,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
W. J. Staple.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan University, Nov 15-16, 1967, p 81-100, National Research Council, Ottawa, Canada 1968. 20 p, 3 fig, 2 tab, 32 ref.

Descriptors: *Soil water movement, *Flow characteristics, *Unsaturated flow, Hydraulic conductivity, Diffusivity, Soil structure, Bulk density, Hydraulic gradient, Soils, Soil water, Steady flow, Unsteady flow, Boundary processes, Hysteresis.
Identifiers: *Flow parameters.

The parameters determining water flow through unsaturated soil are conductivity or diffusivity coefficients. In the simplest situation, when soil moisture tension is a unique function of moisture content, conductivity K and diffusivity D are proportionality factors relating flow rates respectively to hydraulic and moisture content gradients. It follows that K and D may be obtained in flow experiments in which the relevant flow rates and gradients are measured. Conductivity coefficients vary a million-fold in the soil moisture range of interest to hydrologists. No one experimental arrangement is adequate to obtain K for the whole moisture range. Indirect determinations involving diffusivity have been used to extend the data to drier soils, but for some moisture contents satisfactory methods are not yet available. In some cases, improved conductivity data may be inferred in comparing trial computations of moisture movement with experimentally determined moisture profiles. (Carstea-USGS)

MECHANICS OF THE MOVEMENT OF MOISTURE AND CHEMICAL SUBSTANCES IN SOILS,
Guelph Univ. (Ontario). Dept. of Soil Science.
D. E. Elrick, and J. H. M. Aalders.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan University, Nov 15-16, 1967, p 51-79, National Research Council, Ottawa, Canada, 1968. 29 p, 3 fig, 2 tab, 32 ref.

Descriptors: *Soil water movement, *Dissolved solids, *Saturated flow, *Unsaturated flow, Water vapor, Diffusion, Air circulation, Convection, Interfaces, Osmotic pressure, Percolation, Chemical potential, Adsorption.
Identifiers: Matric potential, Osmotic potential, Gravitational potential.

There are 3 groups of forces acting on soil water, namely, matric, osmotic and body forces. A brief description of these forces is given. Isothermal liquid and vapor flow theory is applied to soil moisture movement. Movement of water through both saturated and unsaturated zones is influenced by various potentials such as matric, gravitational, pressure, adsorption, and chemical. Substances dissolved in soil water or present in soil air can move by diffusion or by a combination of diffusion and convection. An analysis of the transport processes of chemical substances in the liquid or vapor phase is included. The interactions taking place at the solid-liquid interface can complicate the overall transport of water and chemical substances. (Carstea-USGS)
W70-03881

ELECTRICAL ANALOGUES AND DIGITAL COMPUTERS FOR ESTIMATING UNSATURATED WATER FLOW IN SOILS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
R. J. Hanks.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan University, Nov 15-16, 1967, p 119-131, National Research Council, Ottawa, Canada, 1968. 13 p, 6 fig, 19 ref.

Descriptors: *Soil water movement, *Analog models, *Digital computers, Soil moisture, Computers, Unsaturated flow, Diffusivity, Dimensional analysis, Soils, Model studies, Analog computers, Computer models.
Identifiers: Hydrologic model studies.

Many complex problems related to water flow through soils may be solved by using electrical analogs and digital computers. Where diffusivity is a constant, solution of unsaturated water flow in soils is very convenient. Analog models are quite inexpensive. Variables can be easily changed and solutions obtained quickly. Analog models are good training tools. The main disadvantages of analogs are: (1) They are limited to the solution of special problems and (2) the solutions are not as accurate as those obtained with digital computers. For one-dimensional flow, the digital computers allow for solution of almost any problem that can be formulated. (Carstea-USGS)

SIMILITUDE FOR PARTIALLY SATURATED FLOW SYSTEMS,
Department of Agriculture, Lethbridge (Alberta). Research Station.
G. E. Laliberte, A. T. Corey, R. H. Brooks, G. L. Corey, and D. B. McWhorter.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan University, Nov 15-16, 1967, p 101-118, National Research Council, Ottawa, Canada, 1968. 18 p, 3 fig, 22 ref.

Descriptors: *Unsaturated flow, *Mathematical models, *Hydraulic models, *Soil water movement, Hydrologic properties, Unsteady flow, Steady flow, Soils, Boundary processes, Hysteresis, Dimensional analysis.
Identifiers: Partially saturated flow.

The use of mathematical and hydraulic models to solve hydrological problems is reviewed. When mathematical approaches cannot provide solutions for physical phenomena, the use of mathematical and hydraulic models may prove useful in understanding these phenomena. Similitude theory was verified in the laboratory for modeling steady and transient flow of two immiscible fluids in saturated and partially saturated soil systems. More research is necessary to find solutions of such problems as boundary effects, medium-fluid interactions, entrapped air, and hysteresis. (Carstea-USGS)
W70-03883

THE EFFECT OF SOIL MOISTURE ON INFILTRATION AS RELATED TO RUNOFF AND RECHARGE,
Saskatchewan Univ., Saskatoon. Dept. of Agricultural Engineering.
Don M. Gray, and D. I. Norum.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan University, Nov 15-16, 1967, p 133-153, National Research Council, Ottawa, Canada, 1968. 21 p, 6 fig, 1 tab, 25 ref.

Descriptors: *Soil moisture, *Infiltration, *Groundwater recharge, *Surface runoff, *Surface-groundwater relationships, Capillary action, Gravitational water, Moisture content, Watersheds (Basins), Capillary conductivity, Moisture tension, Soils.
Identifiers: Capillary conductivity-moisture content curves, Moisture-tension relationships.

In the infiltration process, water enters the soil surface under the combined influences of gravity and capillary forces. The rate of infiltration may be governed by two separate processes: (1) Entry of water through the surface layer and (2) downward movement or percolation of water through the soil profile. The effects of soil moisture on moisture profiles and infiltration rate, the effect of soil moisture gradient, and the interrelationships of soil moisture and other factors influencing infiltration are briefly discussed. Increasing the initial soil moisture content increases the velocity at which the wetting front moves but decreases the infiltration rate. The initial moisture content of the soil affects the shape of the moisture distribution profile. The infiltration potential for soils in a watershed could be evaluated from soil moisture measurements such as: (1) The capillary conductivity-moisture content curve; (2) the moisture-tension relationship, and (3) an experimental relation between the soil moisture content and infiltration rate. Infiltration in frozen and unfrozen soils is also discussed. (Carstea-USGS)

FRACTIONATION OF TRITIUM AND DEUTERIUM IN SOIL WATER,
Geological Survey, Washington, D.C.
Gordon L. Stewart.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 159-168, 1967. 10 p, 1 fig, 8 tab, 5 ref.

Descriptors: *Radioactive dating, *Tracers, *Deuterium, *Tritium, *Distillation, Soil moisture, Clays, Tracking techniques, Ion exchange, Diffusion, Kaolinite, Montmorillonite, Groundwater movement, Surface waters, Sands.
Identifiers: *Tritium fractionation, *Deuterium fractionation, Isotopic exchange.

Laboratory investigations are being conducted to determine the potential capabilities of hydrogen isotopes in age-dating techniques and as tracers for ground and surface waters. Preliminary results show that tritium and deuterium interact with clay minerals as water diffuses through Davidson clay. The data suggest that two stages characterize this interaction with clay minerals: a rapid exchange with more labile hydroxyl groups, followed by exchange with other structural hydroxyls. The initial and rapid exchange was characteristic, but to varying degrees, of all clay minerals used in this investigation. Except for tritium in Davidson clay, the data were not sufficient to show that additional exchange occurs beyond the first stage. The data suggest that isotopic exchange and fractionation of hydrogen isotopes in the clay-water system may be significant for some age-dating and water-tracing investigations where water flow is slow through some kinds of clays. For many investigations, however, this isotope effect is not important, because it is small compared with accuracies required of the data. As the tracer art progresses, it will become possible to apply isotope effect corrections to the data. (Carstea-USGS)

ULTRA-LOW VELOCITY MEASUREMENT IN A STRATIFIED RESERVOIR BY ISOTOPIC CURRENT METER,
Tennessee Valley Authority, Norris. Engineering Lab.
Rex A. Elder, and Svein Vigander.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 81-84, 1967. 4 p, 4 fig.

Descriptors: *Thermal stratification, *Radioactivity techniques, *Radioisotopes, *Reservoirs, *Tracers, Velocity, Iodine radioisotopes, Instrumentation, Current meters, Stratified flow, Flowmeters, Flow measurement, Flow rates.
Identifiers: *Fontana Reservoir, Isotopic current meter.

Field water velocity measurement techniques used in TVA's Fontana Reservoir are described. Thermal density stratification of a uniformly varying type occurs in this reservoir and results in the withdrawal occurring from a discrete layer rather than through the full depth. The velocities, which are in the neighborhood of from 0 to 0.10 ft/sec, are measured by means of an instrument that uses radioactive iodine as a tracer. This meter was developed by the Atomic Energy Commission's Division of Isotopic Development and is termed DWICA-1, for Deep Water Isotopic Current Analyzer. The instrument also measures the current direction. Use of the described technique permits in situ flow studies in thermally stratified reservoirs where very low velocities could hardly be made previously. (Carstea-USGS)

RESULTS OF LIMNOLOGICAL INVESTIGATIONS ON THE VALLEY RESERVOIRS IN THE MORAVA RIVER BASIN,
Brno Univ. (Czechoslovakia).
Milos Zelinka.
Acta sc nat Brno, 2 (12): 1-40, 1968. 24 tab, 3 fig, 124 ref.

Descriptors: *Reservoirs, Water quality, Temperature, Water utilization, Water resources, Water supply, Water development, Epilimnion, Hypolimnion, Bioindicators, Biological properties, Physiochemical properties, Irrigation, Recreation, Fishing.
Identifiers: Czechoslovakian reservoirs, Forecast of water quality.

The results of limnological investigations carried out in 1952-1964 on the valley reservoirs in the Morava River Basin (Czech.) are presented. Tables of average results indicate both the basic characteristics of water composition and the flows in

former investigations. The influence of temperature of water on the development of biological conditions and the exploitation rates of water (water-supply, irrigation, fish breeding) is discussed. The problem of evaluation and prognosis of water quality in newly constructed reservoirs is discussed. The reference includes reports of the Research Institute of Water Management in Brno (Czech.), summarizing data ascertained by investigations on the valley reservoirs in the Morava River Basin. A complete list of publications dealing with limnology of these reservoirs is also presented. (Novotny-Vanderbilt)

BACTERIAL POPULATION OF HUMIFIED LAKES (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
A. G. Rodina.
Mikrobiologiya, Vol 38, No 3, p 531-537, May-June 1969. 2 fig, 7 tab, 17 ref.

Descriptors: *Bacteria, *Population, *Lakes, *Dystrophic, Biological communities, Eutrophication, Oligotrophy, Yeasts, Azotobacter, Sulfur, Detritus, Surfaces, Actinomycetes, Iron, Productivity, Humic acids, Calcium, Hydrogen ion concentration, Color, Magnesium, Chemistry, Temperature, Carbon dioxide, Oxygen, Biochemical oxygen demand, Silica, Nitrogen, Organic matter, Depth, Bottom sediments, Hydrogen sulfide, Humus, Pseudomonas, Pigments, Beggiatoa, Clostridium.
Identifiers: *Humification, Lake Ladoga region (USSR), Mineralization, Spirilla, Physiological groups, Caulobacter, Rhodomicrobium vanielli, Thiothrix, Thiopedia, Chromatium, Rhabdochromatium, Beggiatoa alba.

The number of bacterial plankton in humified lakes of differing degrees of humification varies within wide limits: it is lower than in eutrophic lakes but appreciably higher than in oligotrophic lakes. Changes in water chemistry and bottom deposits, and especially the establishment of an acid pH, create special conditions in a humified lake for the cycle of matter, for the development of life in general, and for development of bacteria in particular. Low mineralization of water and acid pH assist the development of special bacterial associations and changes in bacterial populations, consisting of various physiological groups. Nonsporeforming rods predominate; the ratio of rods to cocci is quite close in all lakes. Sporeforming bacteria require a higher concentration of nutrients whereas many nonsporeforming bacteria extract nutrients from diluted solutions. The cenoses composition of humified lakes consists of many yeasts, filamentous forms and azotobacter-like cells in the bottom water layers, in the pelogen, and various sulfur bacteria on detritus particles and in surface layers of water. Actinomycetes was noted in Lake Naryadnoe and heterotrophic iron bacteria in Lake Solov-'enskoe, USSR. (Jones-Wisconsin)

CONCEPTS OF EUTROPHICATION AND TROPHIC BIOLOGY,
Oesterreichische Akademie der Wissenschaften, Vienna. Lunz Biological Station.
Franz Ruttner.
Fundamentals of Limnology, University of Toronto Press, p 130-131, 159-165, 1963. 2 fig.

Descriptors: *Lakes, *Eutrophication, *Biomass, *Productivity, Cyanophyta, Nuisance algae, Limnology, Chlorophyta, Plankton, Phytoplankton, Water pollution effects, Wisconsin Zooplankton, Tripton, Nannoplankton, Nutrients, Oligotrophy, Temperature, Light intensity, Daphnia, Connecticut, Rotifers.
Identifiers: *Concepts, *Trophic biology, Anabaena flos aquae, Aphanizomenon flos aquae, Gloeotrichia echinulata, Botryococcus, Plankton distribution, Wisconsin Lake Survey, Nitrogen content, Lake Erken (Sweden), Lake Mendota (Wis), Net plankton, Chlorophyll content, Centrifuge method, Calculated volume method, Cyclotella comensis, Rhodomonas lacustris, Enotomostraca, Diaptomids, Bosmina, Carinthia, Sunda Islands.

This standard textbook of limnology includes a discussion of concepts pertaining to eutrophication and trophic ecology of lakes. Mechanical factors influencing plankton distribution include density of water and plankton, differential water viscosity, and turbulent eddy diffusion currents. The following describes formation of nuisance blooms, 'In calm weather the blue-green algae of the plankton rise to the surface in consequence of their 'gas vacuoles' and there aggregate into thick masses, often forming a 'water bloom' recognizable from afar by its blue-green coloration. Anabaena flos aquae and Aphanizomenon flos aquae reveal by their names that they belong to the group of algae that can produce this striking phenomenon.' Based upon a composite definition by others, production can be considered as the total amount of organic matter, representing balance between assimilation and dissimilation, which forms in a defined period from raw materials supplied. Standing crop is defined as the instantaneous living population. Fertility is the average biomass of a unit volume of water within the trophogenic zone, and is governed by limiting nutrients, their conversion to organic matter occurring in proportion to temperature and illumination. Discussion includes a critique of techniques for determination of planktonic biomass. (Eichhorn-Wisconsin)
W70-03959

THE MYXOBACTERIA TYPE QUOTIENT AS AN INDICATOR OF EUTROPHICATION FOR SURFACE WATERS (IN GERMAN),
Erlangen-Nuremberg Univ. (West Germany). Hygienisch-Bakteriologischen Institut.
W. Graf, and P. Sturzenhofecker.
Archiv fur Hygiene und Bakteriologie, Vol 149, No 3/4, p 265-273, 1965. 2 fig, 4 tab, 13 ref.

Descriptors: *Eutrophication, *Myxobacteria, *Surface waters, *Indicators, Biochemistry, Ecology, Plankton, Oxygen, Organic matter, Nitrogen, Phosphorus, Calcium, Hydrogen ion concentration, Color, Mud, Catalysis, Pigments, Depth, Fish, Zooplankton, Sewage, Beaches, Sampling, Carbon dioxide.
Identifiers: *Sporocytophaga cauliformis, Uberlinger See (Germany), Biosphere, Transparency, Catalases, Swarming characteristic, Walchensee (Germany), Kochelsee (Germany), Antibiotic activities.

Aquatic mysobacteria, Sporocytophaga cauliformis, are common in surface waters. They are separable into two types, based on their biochemical properties: Type I can split sugar aided by acid without gas formation and shows strong catalase formation; Type II cannot form sugar from acid and shows a weak catalase activity. An extensive survey of their relative occurrence showed great differences, but ordinarily Type I prevailed about 75%; Type II increased in eutrophic waters. Research shows them as a microbiological indicator of trophication of surface waters. The ability to form catalases is the distinguishing characteristic of the types. A direct relationship between the eutrophication state and the type quotient exists with oxygen content a criterion for type distribution. Type I occurs in oxygen-rich media on the basis of its heavy catalase activity, whereas Type II, on the basis of its low ability to form catalases, grows in an oxygen-poor environment. In assuming that these differences also apply to growth in open water, we obtain direct relationships between the ecology of both types and the oxygen content of the corresponding biotope. (Jones-Wisconsin)

RX FOR AILING LAKES--A LOW PHOSPHATE DIET,
International Joint Commission-United States and Canada.

Environmental Science and Technology, Vol 3, No 12, p 1243-1245, 1969. 2 fig.

Descriptors: *Phosphates, *Lakes, *Detergents, *Tertiary treatment, *Great Lakes, Control, Costs, Eutrophication, Nitrates, Lake Erie, Lake Ontario, Pollution abatement, Oligotrophy, Depth, Phytoplankton, Zooplankton, Physicochemical properties, Domestic wastes, Sewage, Industrial wastes, Agriculture, St Lawrence River, Algae, Coliforms, Dissolved oxygen, Dissolved solids, Temperature, Color, Taste, Hydrogen ion concentration, Iron, Radioactivity.
Identifiers: Canada, Mesotrophy, Lake Norrviken, Lake Mendota, Lake Fures, Lake Sebasticook, Lake Washington, Lake Malaren, Lake Annecy, Lake Vanern, Lake Constance, Pfaffikersee, Turlersee, Baldeggersee, Greifensee, Zurichsee, Moses Lake, Hallwillersee.

Study was initiated in 1964 when the International Joint Commission of the U S and Canada established advisory groups on status of pollution in Lakes Erie and Ontario and segments of the St Lawrence River. Report recommends technical and legislative machinery for control measures. Detergents' phosphate content should be reduced immediately to minimum practical levels, with complete replacement of phosphorus with less innocuous substances no later than 1972. 80% removal of phosphates from all effluents should be effected by 1972 in the Lake Erie basin and by 1975 in Lake Ontario. Treatment of waste effluents for phosphate removal must be in addition to, not a substitute for detergent reformulation. Phosphorus and nitrogen are recognized as the major nutrients responsible for eutrophication; it is apparent that phosphate is the controlling factor in enrichment of lower Great Lakes. Efficient and relatively inexpensive methods are available for 80-95% removal of phosphorus during sewage treatment, whereas comparable elimination of nitrogen compounds is not yet feasible. Costs for phosphate removal at treatment plants would be reduced by one-half to two-thirds with replacement of phosphate detergent builders. (Jones-Wisconsin)
W70-03964

NITROGEN METABOLISM IN LAKES. I. MEASUREMENT OF NITROGEN FIXATION WITH N-15,
Wisconsin Univ., Madison. Dept. of Zoology; and Pittsburgh Univ., Pa. Dept. of Zoological Sciences.
John C. Neess, Richard C. Dugdale, Vera A. Dugdale, and John J. Goering.
Limnology and Oceanography, Vol 7, p 163-169, 1962. 3 fig, 1 tab, 10 ref.

Descriptors: *Nitrogen fixation, *Metabolism, *Lakes, *Analytical techniques, Nitrogen cycle, Wisconsin, Pennsylvania.
Identifiers: *Nitrogen-15, Mass spectrometry, Isotope ratios, Heavy nitrogen, Nitrogen (Kjeldahl), Isotope-ratio mass spectrometers, Lake Wingra (Wis), Lake Mendota (Wis), Pittsburgh (Pa), Error analysis.

Heavy nitrogen (N-15) has been successfully used in studies of nitrogen metabolism in organisms and of biological nitrogen fixation. A method is described for measuring rates of nitrogen fixation in lake water samples using N-15 as a tracer, and subsequent determination of isotope ratio by mass spectrometry of nitrogen fixed during incubation of sample. Details of gassing manifold; including special glassware, are described, as are procedures and reagents. Rates of nitrogen fixation can be calculated from a knowledge of Kjeldahl-nitrogen, determined after incubation, and of isotope enrichment of both starting nitrogen gas and the fixed sample. Selection of proper standards is crucial for accurate determination of aton % excess N-15 in fixed sample. Statistical comparisons of a series of blanks

and standards with a single bulb of compressed, water-pumped nitrogen gas--used as a primary standard--indicated that routine controls are not required and that ammonium sulfate is an adequate secondary standard. Probable sources of error include use of reduced nitrogen-pressure in incubation vessel, length of incubation, and incorporation of label into nitrate or nitrite (lost to the Kjeldahl determination). These errors are negligible in the procedure described. (Eichhorn-Wisconsin)

EVIDENCE FOR EUTROPHICATION FROM REMAINS OF ORGANISMS IN SEDIMENTS,
Indiana Univ., Bloomington. Dept. of Zoology.
David G. Frey.
Eutrophication: Causes, Consequences, Correctives. Proceedings of a Symposium, National Academy of Sciences, Washington, DC, p 594-613, 1969. 8 fig, 28 ref.

Descriptors: *Eutrophication, *Sediments, Paleolimnology, Biochemistry, Algae, Cyanophyta, Mineralogy, Aquatic animals, Stratigraphy, Pollen, Spores, Diatoms, Meromixis, Carbon radioisotopes, Ecology, Silica, Epilimnion, Daphnia, Hypolimnion, Sewage effluents, Nutrients, Clays, Sedimentation rates, Oligotrophy, Glaciation.
Identifiers: *Remains, *Organisms, Fossils, Morphological fragments, Carotenoids, Cladocera, Langsee, Esthwaite water, Lago di Monterosi (Italy), Ambrosia, Community analysis, Zurichsee, Lake Washington, Phacotus, Difflugia, Ceratium, Dinobryon, Staurastrum, Baldeggersee, Oscillatoria, Codonella, Limmat River (Switzerland), Aguada de Santa Ana Vieja (Guatamala), Lake Petenxil (Guatemala), Diversity index, Equitability, Lake Sebasticook (Maine), Centric diatoms, Araphidineas.

'Remains of organisms' may mean both the biochemical substances produced by organisms or resulting from their degradation, and identifiable morphological fragments. Studies of biochemical fossils and the chemistry and mineralogy of sediments are preferable to studies of morphological reamins, since, with new methods and techniques, a close-interval stratigraphy can be constructed from a core only an inch or two in diameter. The most important morphological remains in freshwater sediments are pollen and spores (chiefly of terrestrial plants), diatom frustules and Cladoceran fragments. Pollen diagrams provide a relative chronology; appearance of Ambrosia pollen grains gives a stratigraphic horizon, dating incidence of man and his modification of regional ecology. Diatom remains reflect composition of producing populations; their assemblages in offshore sediment cores show progressive changes, interpretable in terms of the lakes' history and their relative abundance gives insight inot changes accompanying enrichment. Most abundant animal remains in sediments are heads and shells of various Cladocera and new techniques enable us to analyze Cladoceran population responses in greater detail. There are inconclusive indications that quantities of remains may be indicative of past productivity. (See also W70-03975). (Jones-Wisconsin)

SEDIMENT-WATER NUTRIENT INTERCHANGE,
Federal Water Pollution Control Administration, Corvallis, Oreg.
Arnold R. Gahler.
Proceedings of the Eutrophication-Biostimulation Assessment Workship, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 243-257. 6 tab, 20 ref.

Descriptors: *Measurement, *Sediment-water interfaces, Nutrients, Algae, Aquatic plants, Ecosystems, Bacteria, Hydrogen ion concentration, Eutrophication, Suspension, Phosphorus, Phosphates, Nitrogen, Ammonia, Nitrites, Silicates, Nitrates, Conductivity, Oligotrophy, Oregon, California, Minnesota, South Dakota, Dredging, Time, Temperature, Freezing, Storage, Cobalt, Irradiation, Waves (Water), Wind, Fish, Boating, Gases, Diffusion.
Identifiers: *Interchange, Upper Klamath Lake (Ore), Agency Lake (Ore), Salton Sea (Calif), Selenastrum, Shagawa Lake (Minn), Sallie Lake (Miss), Herman Lake (S Dak), Clear Lake (Calif), Woahink (Ore), Interstitial water, Benthic organisms, Algal growth.

Quantitative measurement of nutrient interchange between sediments and overlying lake water is difficult either by field or laboratory tests. Nutrient availability in lake sediments was determined by analysis of interstitial water from sediments taken from Oregon lakes and others in western United States. Much soluble phosphorus and nitrogen is available for algal growth when sediment is physically mixed with overlying water. In shallow lakes, mixing occurs by resuspension of sediments from wave action, stirring by benthic organisms, fish, boating, gas release, lifting of sediment by algal growths, and diffusion. Cores indicate concentrations of nutrients in interstitial water at levels 2-6 feet below the sediment-water interface. This information may be useful in predicting value of dredging for lake restoration. Freezing and storage changes sediments; only fresh sediments give accurate determinations of soluble nutrients in interstitial water. Irradiation of sediments with cobalt for sterilization increased soluble orthophosphate and soluble organic compounds in interstitial water. Laboratory experiments indicate Upper Klamath Lake, Oregon, sediments promote algal growth and elimination of sediment nutrient release by additives forming hydrous oxides and insoluble phosphates indicate that this technique may provide only temporary lake restoration. (See Vol 3, No 7, Field 5C, entry W70-02775). (Jones-Wisconsin)

TRACE ELEMENT MEASUREMENTS IN THE AQUATIC ENVIRONMENT,
Washington State Univ., Pullman. Dept. of Sanitary Engineering.
William H. Funk, Surinder K. Bhagat, and Royston H. Filby.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 207-221. 6 fig, 3 tab, 30 ref.

Descriptors: *Trace elements, *Aquatic environment, Carbon radioisotopes, Algae, Neutron activation analysis, Gamma rays, Cyanophyta, Iron, Cobalt radioisotopes, Sodium, Irradiation, Manganese, Copper, Potassium radioisotopes, Zinc radioisotopes, Strontium radioisotopes, Uranium radioisotopes, Hypolimnion, Epilimnion, Thermocline, Diatoms, Radioisotopes, Scenedesmus.
Identifiers: Particulate matter, Micronutrients, Sodium iodide, Germanium, Washington, Columbia plateau, Aphanizomenon flos-aquae, Chromium radioisotopes, Scandium radioisotopes, Antimony radioisotopes, Rubidium radioisotopes, Thorium radioisotopes, Mercury radioisotopes, Barium radioisotopes, Bromium radioisotopes, Gallium radioisotopes, Lanthanum radioisotopes, Cladophora, Spirogyra, Fragilaria, Stephanodiscus.

Activation analysis appears suitable for direct study of the aquatic environment. Procedures developed could be initially utilized to survey lakes and streams to delimit the micronutrients available, simplifying tests for algal responses to additions of specific micronutrients (since it would be known which were abundant and which deficient); responses could then be measured by carbon-14 or other suitable methods. Speculation is impossible on nutritional requirements or trace element composition of algae tested because of the limited number of analyses made and difficulty in eliminating particulate matter adhering to algal cells. When enough data are gathered and procedures standardized, it may be possible to determine algal growth patterns that are directly related to either overabundance or lack of certain trace elements. It is possible that algae exerts a far greater influence on nutrition of a lake or stream than heretofore believed; they may act as flocculating agents in settling nutrients from the water and alternately take up and release metals, or act as chelating agents complexing many metals and keeping them in solution. (See Vol 3, No 7, Field 5C, entry W70-02775). (Jones-Wisconsin)

THE CLASSIFICATION OF LAKES,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
John R. Donaldson.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 171-185. 7 fig, 2 tab, 7 ref.

Descriptors: *Lakes, *Classification, Biota, Ecosystems, Oregon, Oligotrophy, Alkalinity, Dissolved solids, Hardness (Water), Temperature, Dissolved oxygen, Primary production, Depth, Phytoplankton, Growth rates, Fish, Foods, Zooplankton, Trophic level, Sockeye salmon, Nutrients, Physicochemical properties.
Identifiers: *Oregon lakes, Woahink Lake (Ore), Waldo Lake (Ore), Odell Lake (Ore), Crater Lake (Ore), Morphometry.

Grouping lakes on a regional basis is logical and the trophic nomenclature from oligotrophy to eutrophy is useful only in its broadest sense. Information was collected for Oregon lakes concerning abiotic and biotic conditions and punched onto cards. Density of a food resource is the result of the total output through production and the outflow through consumption and decomposition; thus, it becomes a real measure of changes in these rates or of environmental effects upon them. Production being the product of growth rate and biomass, a relationship is established between biomass and production. By defining relationships between nutrients and primary producers, production models can be developed allowing prediction of the effect of nutrient changes on consumer biomass. This relationship definition is advantageous in understanding the trophic process and providing useful information for the actual management of aquatic resources. Knowledge of density-dependent relations existing within a single lake, as well as among lakes, could significantly aid in establishing a meaningful lake classification scheme. Of greater import is the potential to plot trophic evolution of a lake through the biota instead of merely physically and chemically. (See Vol 3, No 7, Field 5C, entry W70-02775). (Jones-Wisconsin)

FACTORS INFLUENCING ALGAL PRODUCTIVITY IN DEER CREEK RESERVOIR, UTAH,
Utah Univ., Salt Lake City. Dept. of Zoology; and Iowa State Univ., Ames. Dept. of Sanitary Engineering.
Arden R. Gaufin, and Donald B. McDonald.
Transactions American Microscopical Society, Vol 84, p 269-279, 1965. 1 fig, 1 tab, 7 ref.

Descriptors: *Algae, *Primary productivity, *Utah, *Reservoirs, Limnology, Sampling, Plankton, Stratification, Silica, Diatoms, Chlorophyta, Temperature, Surface waters, Distribution, Bays, Ecology, Light intensity, Currents (Water), Geolo-

gy, Geographical regions, Shore-line cover, Carbonates, Dissolved oxygen, Hydrogen ion concentration, Carbon dioxide, Bicarbonates, Nitrates, Phosphates, Ammonia, Physicochemical properties, Sewage, Hypolimnion, Thermocline, Solar radiation, Aquatic plants, Periphyton, Photosynthesis, Cyanophyta, Nitrites, Zooplankton, Nutrients, Cycling nutrients, Chrysophyta.
Identifiers: *Deer Creek Reservoir (Utah), Provo River (Utah), Fragilaria capucina, Asterionella formosa, Stephanodiscus, Cyclotella, Wasatch County (Utah), Flagellates, Seasonal effects, Depth distribution.

Limnological studies (1957-1959) of Deer Creek Reservoir revealed well-defined chemical and thermal stratification during summer, terminating with autumnal overturn. Inflowing waters of the Provo River and seasonal changes were, seemingly, primary influences on chemical conditions; plankton pulses exerted a lesser effect, although silica concentrations were reduced during diatom blooms. Plankton distribution varied seasonally, and although species composition varied during the three years, a general pattern was evident within the reservoir. In winter, Fragilaria capucina, Asterionella formosa, Stephanodiscus, and, in 1959, Cyclotella predominated below the ice. In spring, diverse species of chlorophytes (green algae) appeared in response to recirculating and incoming nutrients. In surface samples, numbers of Asterionella, Stephanodiscus and other diatoms decreased as temperatures increased, and various chlorophytes became common. With autumnal overturn, Asterionella and Stephanodiscus reappeared at surface. Species of chlorophytes varied widely during three years, while predominant diatoms remained constant in 1957-1958. Many plankters were apparently relatively restricted to certain strata of water, but were often displaced by vertical currents. Horizontal distribution was irregular. Generally, open water of the reservoir supports a homogeneous algal flora somewhat different from those in shallow bays. (Jones-Wisconsin)

Donald W. Grimes, W. L. Dickens, and W. D. Anderson.
Agronomy Journal, Vol 61, No 5, p 773-776, Sept-Oct 1969. 3 tab, 3 fig, 16 ref.

Descriptors: *Crop response, *Cotton, *Irrigation efficiency, *Plant growth, *Nitrogen, Arid lands, California, Soil-water-plant relationships, Statistics, Crop production, Fibers (Plant).
Identifiers: *Production function, Plant quality.

Tests were conducted on 2 soils in the arid San Joaquin Valley of California to develop relationships of applied irrigation water and nitrogen to cotton yield components, plant height and fiber quality. Equations were developed relating plant height, flowers, bolls and lint quality to the amount of water applied for 3 levels of nitrogen. There was a positive correlation between yield and number of flowers and bolls. Plant height continued to increase with additional water, but beyond a certain point lint yield responded negatively. Fiber quality was primarily a function of water rather than nitrogen. (Crouse-Arizona)

Identifiers: *Production function.

Water use efficiency for cotton (kg. of lint produced per cm. of water used in the evapotranspiration process) was studied on 2 soil types in the arid San Joaquin Valley of California. One type was clay loam and the other a fine sandy loam. Two inputs, irrigation water and nitrogen, were varied. Relative yield was expressed as a function of evapotranspiration with a regression equation. Increasing increments of water resulted in curvilinear yield responses on both soils for all levels of nitrogen. In both cases a maximum yield level was reached and beyond that additional water application resulted in reduced efficiency. Response to nitrogen was more marked on the sandy loam than the clay loam. Production functions are useful for technical crop management and for determining economic efficiency of inputs. (Crouse-Arizona)

Identifiers: *Mobile-bed hydraulics, Textbooks.

Mobile-bed hydraulics is discussed in a textbook intended for use in graduate courses and by professional civil engineers, hydraulic engineers, hydrologists, and water managers. Sediment transport, erosion, and sedimentation are examined from the viewpoint of self-adjustment after a disturbance of equilibrium. The first 5 chapters teach basic principles, illustrated by field cases, and warn against dangers in interference with field regime. Two chapters lay the theoretical base for analysis of regime and for hydraulic design. The remaining chapters develop approximate practical applications of the basic equations. The design and research uses of hydraulic and mathematical models are given. (Knapp-USGS)

SOME PROPOSALS OF THE STOCHASTIC METHOD OF FORECASTING FOR DEPOSITS IN RESERVOIRS,
Osaka Univ. (Japan). Dept. of Civil Engineering.
Akira Murota.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 49, p 376-383, 1967. 8 p, 4 fig, 2 tab.

Descriptors: *Reservoir silting, *Statistical methods, *Sedimentation, Landslides, Stochastic processes, Sediment transport, Probability, Mass wasting, Markov processes, Queueing theory, Rainfall, Forecasting.
Identifiers: Landslide probability, Landslide forecasting.

Usually forecasts of reservoir sedimentation have been made conventionally by using some empirical values of expected annual deposits. Because the debris yield is directly transported into the reservoirs at the upper reach of a river, the inflow rate of debris into the reservoirs would be highly related to the occurrence of mass movement. Heavy rains may be the prime trigger of mass movements, and may be treated by probability methods. After establishing probability distribution of the debris inflow, every state of the deposition processes, which would be considered as stochastic sequences, may be numerically calculated by means of the queueing theory under the assumption that each stage is a Markoff process. Numerical calculations are given for the Koyadaira basin at the Kurobe reservoir in northern Japan. (Knapp-USGS)

SEDIMENT YIELDS FROM THE CENTRAL COLORADO SNOW ZONE,
Forest Service (USDA) Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Charles F. Leaf.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 96, No HY1, p 87-93, Jan 1970. Proc Paper 7006.

Descriptors: *Sediment yield, *Watershed management, *Water-yield improvement, Erosion, Eronsion control, Sediment discharge, Sediment rates, Sedimentation, Sediments, Trap efficiency, Cutting management, Colorado.
Identifiers: *Experimental watersheds.

To determine the effects of roads and forest-cover changes on sediment yields, measurements were made on one carefully logged and two undisturbed watersheds in the Fraser Experimental Forest, Colorado. Annual sediment yield averaged 200 pounds per acre immediately following road construction in 1950-52 and logging in 1954-56. In the period 1958-66 sediment yield averaged 43 pounds per acre, despite an estimated 25 percent increase in annual runoff caused by the harvest, compared with yields of 11 and 21 pounds per acre on the undisturbed watersheds.

EROSION OF CIRQUES,
North Carolina Univ., Chapel Hill. Dept. of Geology.
William A. White.
Journal of Geology, Vol 78, No 1, p 123-126, Jan 1970. 4 p, 2 fig, 1 plate, 10 ref.

Descriptors: *Erosion, *Cirques, *Glaciers, Topography, Geomorphology, Ice, Scour.
Identifiers: Cirque erosion, Alpine glaciers, Degradation (Glacial).

It is suggested that cirques are formed by deepening through glacial erosion on their floors rather than by headward sapping on their walls. This idea is supported by: (1) dovetailing or interfingering of cirques on opposite sides of narrow aretes; (2) crater cirques that occupy the entire top of individual mountains; and (3) the rarity of cols and greater rarity of passes in narrow aretes. (Knapp-USGS)

AN ERROR FUNCTION DESCRIPTION OF THE VERTICAL SUSPENDED SEDIMENT DISTRIBUTION,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
Joe C. Willis.
Water Resources Research, Vol 5, No 6, p 1322-1329, Dec 1969. 8 p, 6 fig, 1 tab, 3 ref.

Descriptors: *Suspended load, *Mathematical models, *Sediment distribution, Laboratory tests, On-site tests, Diffusion, Dispersion, Model studies, Sediment transport.
Identifiers: Error function distributions.

A new model for the vertical distribution of suspended sediment, which has the form of an error or Gaussian distribution function, agrees with the classical model in the central flow region and has a major advantage in that its integral over the flow depth converges to a consistent estimate of the measured average sediment concentration. The average concentrations predicted by the model compare favorably with concentrations derived from sediment load measurements in both the laboratory and the field. The theoretical diffusion coefficient distributions associated with classical and error function models are also similar. (Knapp-USGS)

UNIFICATION OF DATA ON SEDIMENT TRANSPORT IN FLUMES BY SIMILITUDE PRINCIPLES,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
Joe C. Willis, and Neil L. Coleman.
Water Resources Research, Vol 5, No 6, p 1330-1336, Dec 1969. 7 p, 5 fig, 2 tab, 17 ref.

Descriptors: *Sediment transport, *Hydraulic models, *Hydraulic similitude, Simulation analysis, Model studies, Laboratory tests, Mathematical models, Mathematical studies, Open channel flow, Suspended load, Bed load.
Identifiers: Similitude analysis.

Similitude criteria for flow with sediment transport are derived by normalizing equations of continuity and motion for flow in an alluvial channel. The well-known Reynolds and Froude numbers are obtained as well as a transport similitude number that prescribes the sediment effects on the inertial, gravitational, and viscous forces acting in the flow system. The Froude number along with a similitude number for the median diameter of the sediment particles is found to specify transport similitude for various flume investigations. A unified correlation of sediment discharge data from numerous laboratory flume studies is developed through the similitude analysis. (Knapp-USGS)

2K. Chemical Processes

'SALT-BISCUITS' - A SPECIAL GROWTH STRUCTURE OF NaCl IN SALT SEDIMENTS OF THE TUZ GOLU ('SALT LAKE'), TURKEY,
Heidelberg Univ. (West Germany). Sediment Research Lab.
German Muller, and Georg Irion.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1604-1607, Dec 1969. 4 p, 5 fig, 4 ref.

Descriptors: *Chemical precipitation, *Sodium chloride, *Salts, *Lakes, *Water chemistry, Sediments, Evaporation, Surface waters, Sedimentation, Particle shape.
Identifiers: *Turkey, Tuz Golu (Salt Lake).

Biscuit-shaped NaCl disks are the main constituents of a special sediment type in evaporating Tuz Golu, Turkey. Their origin can be observed directly: thin salt flakes grow in the surface water layer of the basin and settle down. After deposition they continue growing in all directions, larger NaCl crystals developing at the bottom, smaller ones on the top of the disks. (Gabriel-USGS)

STABILITY OF CALCIUM CARBONATE POLYMORPHS IN WARM, SHALLOW SEAWATER,
Brown Univ., Providence, R.I.
H. Dale Winland.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1579-1587, Dec 1969. 9 p, 3 fig, 2 tab, 16 ref.

Descriptors: *Calcium carbonate, *Sea water, *Shallow water, Magnesium, Calcite, Ions, Chemical analysis, Water chemistry, Magnesium carbonates, Sediments, Limestones, Recent epoch, X-ray analysis, Stability, Energy, Trace elements.
Identifiers: British Honduras Shelf, Bahama Bank, Calcium carbonate stability.

Skeletal elements originally high Mg calcite are recrystallized to aragonite in Recent marine carbonate sediments. An explanation is proposed based on the stability of the calcium carbonate polymorphs. The stability fields defined for calcite and aragonite from experimentation with pure minerals in distilled water should not be projected unmodified into the marine environment because ions other than calcium can substitute for calcium in their crystal structures. A condition of equilibrium between coexisting crystalline calcium carbonate and seawater can be reached only if the distribution of major and minor ions between the separate phases is in equilibrium. Aragonite in equilibrium with seawater should contain about 0.9 mol % Sr and have a free energy of formation of about -269.5 kcal/mol. Calcite in equilibrium with seawater should contain about 10 mol % Mg and have a free energy of formation of about -267.0 kcal/mol; therefore low Mg calcite is not in equilibrium with seawater in shallow marine environments. Of the impure polymorphs, aragonite has the lower free energy of formation and should be the thermodynamically stable form in shallow marine environments. Partition and stability information show that marine carbonate sediments cannot undergo diagenesis to normal limestones, containing 1 to 3 mol % Mg, in marine water. (Garbiel-USGS)

APPLICATION OF DEUTERIUM ANALYSES TO THE HYDROLOGY OF THE LAKES OF THE GRAND COULEE, WASHINGTON,
Geological Survey, Denver, Colo.; and Woods Hole Oceanographic Institution, Mass.
Irving Friedman, and Alfred C. Redfield.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 77-80, 1967. 4 p, 1 fig.

Descriptors: *Deuterium, *Lakes, *Heavy water, *Tracers, *Radioactivity techniques, Washington, Evaporation, Freezing, Water sources, Water chemistry, Surface waters, Canal seepage, Water balance, Reservoirs, Inflow, Streams, Groundwater, Hydrogeology.
Identifiers: *Grand Coulee (Wash).

The heavy isotopic forms of water, HDO and water containing O-18 occur in natural waters and can serve as natural tracers. Changes in deuterium content take place by freezing or evaporation. The probable sources of water pumped from the ground can be identified by measuring deuterium and ionic composition. Change in concentration of deuterium by evaporation follows different laws than does the change in ionic content. The hydrology of a series of lakes that occupy the abandoned gorge of the Columbia River was studied by isotopic analysis. Deuterium analysis shows that the upper lakes, Park and Blue, receive over 90% of their water from upstream surface inflow. Soap Lake is fed mainly by irrigation canal leakage, and a little seepage from another lake. Simultaneous equations for the balance of water, deuterium and salt were used to estimate the character and quantity of inflow and outflow from natural water reservoirs. (Carstea-USGS)

REGIONAL VARIATIONS OF RIVER WATER COMPOSITION RESULTING FROM HALITE SOLUTION, MACKENZIE RIVER DRAINAGE BASIN, CANADA,
Research Council of Alberta, Edmonton; Calgary Univ. (Alberta); and Dept. of Energy, Mines and Resources, Calgary (Alberta). Inland Waters Br.
Brian Hitchon, A. A. Levinson, and S. W. Reeder.
Water Resources Research, Vol 5, No 6, p 1395-1403, Dec 1969. 9 p, 3 fig, 1 tab, 28 ref.

Descriptors: *Water quality, *Water chemistry, *Leaching, *Saline water, Saline water systems, Chlorides, Brines, Groundwater movement, Runoff, Infiltration, Overland flow.
Identifiers: Halite, Mackenzie River (Canada).

The composition of surface waters in the Mackenzie River drainage basin falls into three general groups: (1) rivers entering the Slave-Mackenzie system from the west which have total dissolved solids of 100-200 mg/l and chloride in the range less than 1 mg/l in their headwaters to 2-5 mg/l at their mouths; (2) surface waters on the Canadian Shield which have lower total dissolved solids (less than 100 mg/l) and chloride (less than 1 mg/l); and (3) the Slave and Mackenzie rivers and the Great Bear and Great Slave lakes, which have total dissolved solids 100-200 mg/l and chloride 5-10 mg/l. Cross sections with evidence of solution collapse structures and anomalous depositional thicknesses indicate extensive solution of Middle Devonian halite and movement of the resulting brines to discharge areas near the Slave River. Chemical and isotopic analysis of saline springs in the discharge area show an origin by solution of halite (and gypsum) by meteoric water. (Knapp-USGS)

DIEL AND SEASONAL VARIATIONS IN PHYSIOCHEMICAL LIMNOLOGY, SPEED RIVER, ONTARIO,
Guelph Univ. (Ontario).
John R. M. Kelso, and Hugh R. MacCrimmon.
Water Resources Research, Vol 5, No 6, p 1388-1394, Dec 1969. 7 p, 4 fig, 1 tab, 11 ref.

Descriptors: *Water chemistry, *Water quality, *Diurnal, *Biochemistry, Limnology, Rivers, Trace elements, Ammonia, Chlorides, Nitrates, Silica, Phosphates, Sulfates, Hydrogen ion concentration, Dissolved oxygen.
Identifiers: *Canada, *Speed River (Ontario).

Diel pulses occurred in pH, dissolved oxygen, and free carbon dioxide in Speed River, Ontario. Iron and fluoride levels were stable. Total alkalinity, silica, and turbidity levels varied, but not significantly. Wide diel ranges existed in ammonia, chloride, nitrate, nitrite, orthophosphate, sulfate, and specific conductance levels. High hexavalent chromium levels (0.57 mg/l) occurred only on one occasion. Diel means of these characteristics showed seasonal change fitting the seasonal trends evident during the year of observation. The nature and extent of diel variation are generally required to determine an effective procedure for examination of local changes in limnologic conditions. (Knapp-USGS)

Water Resources Research, Vol 5, No 6, p 1353-1363, Dec 1969. 11 p, 4 fig, 5 tab, 17 ref. NSF Grants GB1144, GB4169, GB6757, and GB6742.

Descriptors: *Water chemistry, *Water quality, *Small watersheds, *Surface-groundwater relationships, *Rainfall-runoff relationships, New Hampshire, Demonstration watersheds, Leaching, Mixing, Solutes, Aqueous solutions, Infiltration, Base flow, Seepage, Streamflow, Bank storage.
Identifiers: Hubbard Brook Experimental Watershed (N H).

Stream water chemistry varies hyperbolically with stream discharge through four decades of discharge change within the Hubbard Brook Experimental Forest, New Hampshire. This dilution process is most simply explained by the mixing of rain water or surface water with deeper soil water. The resultant mixture of waters subsequently appears as stream water. Sodium and silica concentrations in stream water are markedly diluted during high discharge periods while hydrogen ion, aluminum, and nitrate concentrations are increased. Magnesium, calcium, sulfate, chloride and potassium concentrations are changed very little by stream discharge variations. During the summer, biologic activity measurably reduces the concentration of nitrate and potassium in stream water. (Knapp-USGS)

IRON IN NATURAL WATERS--ITS CHARACTERISTICS AND BIOLOGICAL AVAILABILITY AS DETERMINED WITH THE FERRIGRAM,
Minnesota Univ., Minneapolis. Limnological Research Center.
Joseph Shapiro.
Verhandlungen der Internationalen Vereinigung fur theoretische und angewandte Limnologie, Vol 17, p 456-466, 1969. 15 fig, 1 tab, 5 ref.

Descriptors: *Bioassay, *Iron, Hydrogen ion concentration, Inorganic compounds.
Identifiers: *Ferrigram (Histogram), EDTA, Ethylenediaminetetraacetate, Fingerprint technique, Ferric iron, Potassium thiacynate, Optical density.

Ferric iron of surface waters was permitted to react with potassium thiocyanate (KSCN) at pH values ranging from 4.0 to 0.5. The results were expressed in the form of a histogram, called ferrigram. Depending on the nature of water, increase in reactability of iron with KSCN was either at higher or lower pH values thus rendering 'right-handed' and 'left-handed' ferrigrams. A mixture of two waters produced racemic results approaching arithmetic average. Addition of ethylenediaminetetraacetate (EDTA) increased the reactivity of iron in more acid solutions. Bioassay employing Microcystis aeruginosa and Gloeotrichia echinata indicated that availability of iron is related to the shape of the ferrigram. The ferrigram is a useful tool for empirical fingerprinting of iron in natural waters. (Wilde-Wisconsin)

PRINCIPLES OF PRIMARY PRODUCTIVITY: PHOTOSYNTHESIS UNDER COMPLETELY NATURAL CONDITIONS,
Bowling Green State Univ., Ohio. Dept. of Biology.
Jacob Verduin.
Algae and Man (Jackson, D F, editor) Plenum Press, N Y, p 221-238, 1964. 3 fig, 3 tab, 6 ref.

Descriptors: *Primary productivity, *Photosynthesis, *Environmental effects, Respiration, Ponds, Phytoplankton, Limiting factors, Physiological ecology, Carbon dioxide, Phosphorus, Nitrogen, Iron, Nutrients, Aquatic habitats, Light, Hydrogen ion concentration, Pennsylvania, Euglena, Lakes, Lake Erie, Michigan, Analytical techniques, Oxygen.
Identifiers: *Photobiology, *Chemical processes, Glenodinium, Trachelomonas, Predictive equations, Ceratium, Baule-Mitscherlich equation, Thiel College (Pa), Ulva lactuca, Algal populations, Differential titration, Lambert-Beer law, Suspensoid concentrations, Winkler technique, Community metabolism, Young's Pond (Pa), Brown's Pond (Pa), West Lost Lake (Mich), Maumee River, Ohio River, Pymatuning Reservoir (Pa).

Individual determinations of primary productivity vary widely, both spatially and temporally. Simper methods for determining such rates, permitting acquisition of many data, are preferable to more precise, but time-consuming techniques. Studies under completely natural conditions are desirable because in bottled samples, surface effects yield erroneous values for both photosynthesis and respiration. Community metabolism can be assessed by measuring, over short intervals, changes in dissolved oxygen by Winkler's techniques, and changes in concentration of carbon dioxide by differential titration. Estimates of hourly photosynthetic rates per microliter of phytoplankton, determined thus for two small ponds, are in good agreement with data reported in the literature. Analysis of photosynthetic yields, based on theoretical considerations and on the Baule-Mitscherlich equation for limiting factors, suggests that, among physical, chemical, and biotic factors, several factors can simultaneously limit photosynthetic yield. Substantial reduction of optimal yield is probably the rule in aquatic environments. The Lambert-Beer's law, describing attenuation of light in water, can be modified by adding an exponential term for concentration of light-adsorbing particulates. Several applications of the resultant equation to aquatic environments are recommended for further study. (See Vol 2, No 19, Field 5C, entry W69-07832). (Eichhorn-Wisconsin)

EOLIAN MICRORIDGES ON MODERN BEACHES AND A POSSIBLE ANCIENT EXAMPLE,
Geological Survey, Menlo Park, Calif.
Ralph E. Hunter.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1573-1578, Dec 1969. 6 p, 5 fig, 17 ref.

Descriptors: *Sedimentary structures, *Beaches, *Sands, Winds, Wind velocity, Geology, Waves (Water), Ripple marks, Particle size, Sandstones.
Identifiers: Eolian microridges.

Eolian microridges consist of a series of anastomosing ridges less than 1 cm in wave length. Eolian microridges have been observed to form where sand was being blown in saltation across wet sand surfaces, mostly on beaches. The ridges and intervening troughs are oriented transversely to wind direction and commonly have several types of asymmetry by which the direction of the wind that formed them can be determined. The structure may be distinguished from ordinary ripples of unusually small wave length by several criteria other than wave length. Eolian microridges are potentially preservable and structures found on several bedding planes of the Keefer Sandstone (Middle Silurian) near Lewistown, Pennsylvania, are possibly preserved examples. These structures, together with other evidence, strongly suggest a beach environment for this sandstone. (Gabriel-USGS)

THERMAL CIRCULATION ON A ROTATING SPHERE; WITH APPLICATION TO THE OCEANIC THERMOCLINE,
Harvard Univ., Cambridge, Mass.; and Stockholm International Meteorological Inst. (Sweden).
A. R. Robinson, and Pierre Welander.
Journal of Marine Research, Vol 21, No 1, p 25-38, 1963. 2 fig, 4 ref.

Descriptors: *Model studies, *Mathematical model, *Stratification, *Thermocline, *Thermal stratification.

A mathematical model was developed of the thermal boundary layer beneath the surface of a differentially heated fluid portion of a rotating sphere, i.e., a region in which thermal conductivity is important but viscosity is negligible. A convective circulation in the rotating self-gravitating sphere is induced by prescribing a distribution of temperature on the free surface and a lower, constant temperature on the bottom. The motion is assumed to be laminar and steady. A general three dimensional similarity transformation is performed, and features of the related temperature and flow fields are studied. It was found that an upwelling of cold water into the boundary layer region from below is always necessary, that horizontal advection of heat is relatively negligible, and that a strong relation exists between boundary layer depth and surface forcing function. The solutions are examined for numbers characteristic of the main oceanic thermocline. (Guerrero-Vanderbilt)
W70-03725

NOTES ON THE THEORY OF THE THERMOCLINE,
New York Univ., Bronx. Dept. of Meteorology and Oceanography.
Robert Blandford.
Journal of Marine Research, Vol 23, No 1, p 18-29, 1965. 4 ref, 4 fig.

Descriptors: *Thermocline, *Diffusion, *Heat balance, *Convection, Thermal stratification.
Identifiers: Ekman layer.

An exact analytical solution is closed form for a steady, laminar model of the oceanic thermocline is presented. The model includes vertical diffusion and horizontal and vertical convection of heat. The solution satisfies boundary conditions that are in fair agreement with observation over the range of latitude of 10 deg to 45 deg. The behavior of the solution is given as a function of the imposed temperature and vertical velocity component at the bottom of the Ekman layer. A typical result of the analysis is that, as the surface temperature increases, the thermocline depth decreases, and the deep vertical velocity component increases. Subpolar gyres are shown to be excluded for some boundary conditions. The equations solved numerically by Stommel and Webster are shown to be exact and a derivation of Robinson's equations for an equatorial thermal regime is given. (Guerrero-Vanderbilt)
W70-03726

ON THE ROLES OF VERTICAL VELOCITY AND EDDY CONDUCTIVITY IN MAINTAINING A THERMOCLINE,
Washington Univ., Seattle. Dept. of Oceanography.
Roy Overstreet, and Maurice Rattray, Jr.
Journal of Marine Research, Vol 27, No 2, p 172-190, 1969. 9 fig, 19 ref.

Descriptors: *Mathematical model, *Thermocline, *Heat balance, Thermal stratification.
Identifiers: *Eddy coefficient, *Mass transport.

A model was developed of the permanent thermocline from a simplified heat balance equation in which the horizontal advection and conduction of heat have been neglected. Steady state solutions describing the general features of the temperature distributions associated with both divergent and convergent Ekman layers have been obtained for various distributions of vertical velocity and eddy conductivity. Some conclusions were: (1) Given a constant eddy coefficient, deep thermoclines can occur only in regions of Ekman convergence. (2) For divergent Ekman transport, a mixed layer can be modeled with an eddy coefficient that decreases with depth. (3) A variable eddy coefficient has an apparent advective effect. (4) Two of the solutions agree with observations in regions having respectively divergent and convergent Ekman mass transport. (Guerrero-Vanderbilt)
W70-03730

ON THERMALLY MAINTAINED CIRCULATION IN A CLOSED OCEAN BASIN,
Harvard Univ., Cambridge, Mass.
P. P. Niiler, A. R. Robinson, and S. L. Spiegel.
Journal of Marine Research, Vol 23, No 3, p 222-230, 1965. 4 fig, 3 ref.

Descriptors: *Mathematical model, *Thermocline, *Circulation, Thermal stratification.
Identifiers: *Thermohaline.

A three dimensional model was developed of a thermohaline-maintained circulation for a closed basin of finite depth on the beta plane. Diffusive processes were neglected and hence allow no interchange of momentum or heat with the region above the thermocline. The quasilinear, and quasigeostrophic, three dimensional problem was solved for the case of a semicircular basin of constant depth, where the potential vorticity is conserved in a relatively simple manner. The circulation, which conserves potential vorticity, consists of a wastward drift at all levels in the open ocean and a return flow that is accomplished in a swift eastward flowing current. A comparison was made to Worthington's paper on water mass analysis of deep circulation in the North Atlantic Basin. (Guerrero-Vanderbilt)

SUBMERGENCE EFFECTS ON A RHODE ISLAND BARRIER AND LAGOON AND INFERENCES ON MIGRATION OF BARRIERS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
William P. Dillon.
Journal of Geology, Vol 78, No 1, p 94-106, Jan 1970. 13 p, 8 fig, 34 ref.

Descriptors: *Beaches, *Sedimentation, *Erosion, *Rhode Island, Waves (Water), Currents (Water), Provenance, Sediment transport, Sands, Beach erosion, Coasts, Deposition (Sediments), Geomorphology, Littoral drift, Surf, Silts, Tides, Vegetation effects.
Identifiers: Cape Cod (Mass).

The Charlestown-Green Hill barrier beach-lagoon complex lies along Rhode Island's south shore. Barrier beach and tidal delta sands, lagoonal fine sediments, and lag deposits have been deposited on a base of glacial till, outwash, and glaciofluvial sand. The beach and lagoonal sediments have been derived mainly from reworking of glacial sediments. Tidal currents have built a sand delta at the inshore end of an inlet, but sand on the barrier beach's lagoonal side has been introduced over the barrier. Fine sediments are deposited in the deepter areas of the lagoon. The barrier beach was formed at a lower sea level, and moved landward as the sea transgressed, with lagoonal deposition migrating with the barrier. The small size of this barrier places its base at a shallow depth, resulting in erosion of the entire seaward side by storm waves and also permitting considerable transport of sand across the barrier to the lagoon side. The barrier has remained small because of lack of sand supply. Thus lack of sand supply seems to be the dominant factor in allowing the landward migration of this barrier. (Knapp-USGS)

3A. Saline Water Conversion

OPERATION OF SEA WATER DISTILLATION PLANTS,
Office of Saline Water, Washington, D.C. Test and Evaluation Branch.
Robert H. Evans.
Journal of American Water Works Association, Vol 61, No 12, p 663-666, Dec 1969. 4 p, 4 fig.

Descriptors: *Desalination plants, *Efficiencies, *Water cost, Water supply, Water treatment, Distillation, Capital costs, Construction costs, Maintenance costs, Operating costs.
Identifiers: *Desalination costs.

Operating expenses, water costs, plant availability, and life of desalination plants are briefly reviewed. Prior to 1962 the desalting industry built plants which operated at very low performance ratios (water produced/Btu input). Most plants operated at between 5 and 7 lb of water/1,000 Btu, below 185 deg F brine temperature, and generally used polyphosphates for scale control. These plants were generally small and produced relatively high cost water in areas with no alternative source of water. OSW distillation plants, as illustrated by Freeport and Pt. Loma, were operating at performance ratios of about 10 in 1963. With the new Clair Engle Plant design, the performance ratio was raised to 20 and in future hybrid plants it is expected to be of the order of 25. OSW increased operating temperatures to 250 deg F using acid for scale control. In the last 3 years processing capability has passed 250 mgd. The largest commercial installation in the United States, the Westinghouse 2.62-mgd multistage flash unit at Key West, Fla, cost $4,056,000; it occupies 3.3 acres; and produces water at $0.86/1,000 gal. It has been onstream over 90% and is extremely successful. (Knapp-USGS)
W70-03657

DEVELOPMENT OF MATHEMATICAL MODEL AND COMPUTER PROGRAM FOR OPTIMIZATION OF VERTICAL TUBE EVAPORATOR SALINE WATER PLANTS,
Houston Research Inst., Inc., Tex.
A. E. Dukler, C. J. Huang, and M. L. Lee.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $2.25. Office of Saline Water Research and Development Progress Report No 404, Feb 1969. 164 p, 16 fig, 2 tab, 8 ref, 9 append. OSW Contract No 14-01-0001-657.

Descriptors: *Mathematical models, *Computer programs, *Desalination processes, *Desalination plants, Evaporators, Simulation analysis, Capital costs, Operating costs, Optimization, Dynamic programming, Systems analysis.
Identifiers: *Vertical tube evaporator desalting plant, Multistage evaporator process simulation, Fortran.

Techniques and mathematical models were developed for an optimum design of a VTE desalting plant. The optimization system is then programmed into an electronic computer which automatically searches and arrives at an optimum design. The computer program, as it results, is very flexible and versatile. The complete system is divided into 4 major subsystems which are Multistage Evaporator Process Simulation, Engineering Design Simulation, Capital and Operating Cost Calculation, and Optimum Searching Techniques. The Engineering Design Simulation and the Capital and Operating Cost Calculation are based on the design concept of a multistage evaporator system

arranged into the concentric geometric configuration. Modification of these subsystems for other geometrical arrangements can be accomplished readily and with little difficulty. Instructions are given for preparing the input data cards as well as operating the system. The source program is written in Fortran IV. (Carstea-USGS)
W70-03665

IMPROVED ANIONIC MEMBRANES FOR ELECTRODIALYSIS,
Monsanto Research Corp., Dayton, Ohio.
I. O. Salyer, E. V. Kirkland, and P. H. Wilken.
Office of Saline Water Research and Development Progress Report No 483, Dec 1969. 43 p, 11 fig, 14 tab. OSW Contract No 14-01-0001-1769.

Descriptors: *Membranes, *Desalination process, *Ion exchange, *Electrodialysis, Ammonium compounds, Hydrolysis, Saline water, Brackish water, Films, Research and development.
Identifiers: *Anionic membranes, Copolymenzation, Methyl iodide.

The preparation of aliphatic anion exchange membranes composed of ethylene-tri-methyl vinyl ammonium chloride copolymer involves four major steps: (1) copolymerization of ethylene and N-vinyl phthalimide, (2) film formation, (3) hydrolysis to ethylene-vinyl amine copolymer, and (4) quaternization with methyl iodide. It was found that di-t-butyl peroxide was an efficient initiator of the copolymerization reaction. The charge ratio was used to control the ratio of monomer in the copolymer products. The membranes were prepared by pressing the material between hot plates in a hydraulic press. Hydrolysis has been accomplished with hydrazine hydrate at temperatures below the reflux temperature. The experimental membranes have been compared with commercial membranes by means of several accepted screening tests. (Carstea-USGS)
W70-03666

RESEARCH AND DEVELOPMENT ON LOW PRESSURE REVERSE OSMOSIS MEMBRANES AND DESIGN OF A SMALL UNIT FOR BRACKISH WATER,
Dartmouth Coll., Hanover, N.H.
Christian S. Miller, and D. Dean Spatz.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.60. Office of Saline Water Research and Development Progress Report No 339, Mar 1968. 55 p, 17 fig, 8 tab, 36 ref, 4 append. OSW Contract No 14-01-0001-939.

Descriptors: *Desalination processes, *Reverse osmosis, *Water supply, Research and development, Brackish water, Membranes, Cellulose, Economics.
Identifiers: Cellulose acetate membranes, Polyester membranes, Drinking water.

Cellulose acetate desalination membrane technology and a simple, inexpensive desalination appliance which can supply water needs for a family of five are discussed. The proposed appliance will operate on the principle of reverse osmosis utilizing only the water pressure already present in the household water system. A testing program using a reverse osmosis cell has established the economic feasibility of using the method in larger systems. (Carstea-USGS)

THERMO-ECONOMICS OF SALINE WATER CONVERSION,
Dartmouth Coll., Hanover, N.H. Thayer School of Engineering.
Robert B. Evans, and Myron Tribus.
I and EC Process Design and Development, Vol 4, No 2, p 89-100, Apr 1965. 9 fig, 4 tab, 22 ref.

Descriptors: *Saline water, *Demineralization, *Thermodynamics, *Economics, Optimization, Energy, Desalination apparatus, Costs.
Identifiers: Optimum-energy technique.

The technological problems of saline water demineralization were set forth in concise form as they appeared in the light of an intensive study of the underlying principles of thermodynamics and economics. This was done by digesting the pertinent principles of thermodynamics and economics into a compact formalism which the writers call the 'Optimum-energy technique'. The essence of the optimum-energy technique was embodied in the use of the optimum-energy equation. The pertinent thermodynamics and economics were manifested in this equation in the form of two critical unit costs: energy costs and equipment costs. It was concluded that research programs in saline demineralization should be initiated for each type of desalination equipment with the specific goal of striving for lower conductance costs and lower available energy costs for each tentative energy source. Hope was expressed that optimum-energy technique, as a digest of the pertinent thermo-economics, would help to speed the advance of saline water conversion. (Thiuri-Cornell)
W70-03935

DESIGN AND COST OF ION-EXCHANGE SOFTENING FOR A 50-MGD SEA-WATER EVAPORATION PLANT,
California Univ., Berkeley. Sea Water Conversion Lab.
Gerhard Klein, Kamel M. Makar, Badawi W. Tleimat, and Theodore Vermeulen.
Sea Water Conversion Lab Rep No 68-2, Water Resources Center Desalination Rep No 25, Sept 1968. 59 p, 12 fig, 10 tab, 31 ref, 2 append.

Descriptors: *Design, *Costs, *Ion-exchange, *Water softening, Optimization, Sea water, Distillation, Pre-treatment (Water), Economics, Interest rate, Evaporators.
Identifiers: Calcium removal.

The optimization of a large desalting plant was discussed. Mathematical equations were developed and utilized to determine the economic feasibility of calcium removal by a large distillation plant. Sea water was pretreated to avoid scale formation during distillation. It was possible to express all costs that affected the optimization as functions of the saturation time elapsed in one cycle of operation. The design study resulted in an estimated cost for calcium removal of 3.6 or 3.8 cents per thousand gallons of distilled-water product from the evaporator, based on respective interest rates of 3.125 or 4.125 per cent per year on the depreciated plant investment. Since this pretreatment led to more economic distillation conditions, the attendant savings largely offset the cost of pretreatment. (Thiuri-Cornell)

TECHNOLOGY OF SEA WATER DESALINATION,
Weir (G. and J.) Ltd., Glasgow (Scotland).
Hugh C. Simpson, and R. S. Silver.
Selected Papers on Desalination and Ocean Technology, Dover Publications, New York, p 387-413, 1968. 3 fig, 2 tab, 7 ref.

Descriptors: *Desalination processes, *Fresh water, *Saline water, *Optimization, *Electrodialysis, *Reverse osmosis, Vapour compression distillation, Hydrate process, Mathematical studies.
Identifiers: Transfer area.

The processes for the recovery of fresh water from sea water were analyzed and the minimum costs of sea water desalination corresponding to optimum driving forces across the transfer surface were estimated by use of mathematical methods. Under optimum conditions the cost of sea-water desalination decreased slowly as the cost of transfer area and power and the transfer resistance were reduced. Electrodialysis, reverse osmosis, and vapor recompression were all likely to produce more expensive fresh water than multi-stage distillation for any reasonable costs of the transfer surface. Freezing and hydrate processes, on the other hand, could produce water at lower costs than could multi-stage distillation. However, the water costs for these latter two processes, have been under-estimated, since they can be evaluated with sufficient accuracy only by large scale experimental work. (Thiuri-Cornell)

Daniel Hillel.
Final Technical Report to US Department of Agriculture, Rehovoth, 1967. 142 p, 34 tab, 46 fig, 83 ref. Project No A10-SWC-36. Grant No FG-Is-178.

Descriptors: *Arid lands, *Water harvesting, *Rainfall-runoff relationships, *Infiltration, *Soil sealants, Surface runoff, Slopes, Rainwater, Small watersheds, Surface sealing, Soil compaction, Wettability, Soil dispersants, Rainfall, Simulated rainfall, Rainfall intensity, Water yield improvement, Soil erosion, Economic feasibility.
Identifiers: *Israel.

If runoff from slopes can be artificially increased, it can be concentrated in crop planted areas. Thus, natural precipitation could be used more efficiently in agriculture. Results are presented of laboratory and field trials of several different materials and treatments tested to reduce infiltration and thereby increase runoff. All work was conducted in Israel. The various treatments were first screened in the laboratory with a specially designed rainfall simulator and the more promising were field tested in two areas. Results varied somewhat with soil type and rainfall intensity and duration. Under the right conditions it was found that runfff-to-rainfall ratios as high as 80 to 90% could be obtained. Types of treatments were mechanical smoothing and compaction and application of substances to bind, seal, crust, and waterproof the surface. The ultimate question is one of economic feasibility. Some preliminary cost figures are presented. (Crouse-Arizona)

A METHOD FOR STATISTICAL EVALUATION OF WEATHER MODIFICATION AT THE RIVER FLOW CONTROL LEVEL,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Radmilo D. Markovic.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 80, p 641-647, 1967. 7 p, 3 fig, 2 ref. Bureau of Reclamation Contract No 14-06-D-5229.

Descriptors: *Weather modification, *Evaluation, *Streamflow, *Variability, *Statistical methods, Streamflow forecasting, Time series analysis.
Identifiers: Weather modification evaluation.

The natural variability of river flows is relatively high and the expected increase in water yield caused by weather modification experiments is relatively low. These two conflicting facts call for a very refined and sensitive method of solving the problem of statistical evaluation of weather modification attainments. The method developed and presented is one answer to the problem of weather modification evaluation. It was employed at the river flow control level by using the annual river flows as the main variable. The target-control concept was used in the development of the joint distribution function of target river flows conditioned by those in the control basin and the upper tailed test of significance with the intention of maximizing the discriminating power of this statistical test. The applicability of this method is demonstrated by an actual example. (Knapp-USGS)

3C. Use of Water of Impaired Quality

DISTRIBUTION OF CHLORIDES IN AN IRRIGATED CITRUS ORCHARD,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
B. Yaron, E. Mor, and A. Goell.
Israel Journal of Agricultural Research, Vol 18, No 4, p 201-208, Oct 1968. 1 tab, 4 fig, 6 ref.

Descriptors: *Arid lands, *Irrigation water, *Saline water, *Chlorides, *Citrus fruits, Leaching, Soil chemistry, Irrigation, Water quality, Soil-water-plant relationships.
Identifiers: *Israel.

If relatively saline water is used in irrigation, a build-up of chlorides in the soil may be expected. A value of 10 to 15 meq per liter of saturated soil paste has been suggested as the level of toxicity for citrus. This paper reports the chloride level and movement in the soil for one season of irrigation with water containing 2.9, 8.5, 11.3 and 15.5 meq per liter chlorides. The chlorides tended to accumulate between 30-90 cm. depth. The mean chloride content did not reach the 15 meq per liter level in one season for any of the treatments. However, the chlorides were only partially leached by the following winter rains, so a continuous build-up of chlorides from year to year might be expected with continuous use of saline irrigation water. (Crouse-Arizona)

3D. Conservation in Domestic and Municipal Use

PUBLIC PARKS, FORESTS AND RECREATION.

Tenn Code Ann secs 11-1401 thru 11-1417 (Supp 1969).

Descriptors: *Tennessee, *Rivers, *Conservation, *Water resources development, Legislation, Natural resources, Recreation, Eminent domain, Legal aspects, Administrative agencies, Federal government, Scenic easements, Local governments, River systems, Water pollution, Pollution abatement, Land use, Classification, Water conservation, Land management, Scenery.

River, free flowing, and scenic easements are defined. The three classes of scenic river areas are natural river areas, pastoral river and partially developed river areas. Natural river areas are those free-flowing rivers with shorelines and scenic vistas unchanged by man, with no extensive paralleling roads closer than one mile. Those free-flowing rivers, the lands adjacent to which are partially or predominately used for agriculture and other dispersed human activities which do not substantially interfere with public use and enjoyment of the rivers and their shores are pastoral river areas. Partially developed river areas are those rivers in areas affected by the works of man, but which still possess actual or potential scenic values. Regulations for the scenic rivers system which is administered by the Department of Conservation are provided. The Commissioner of Conservation establishes boundaries of the scenic river area and acquires land by donation, purchase, exchange, eminent domain or otherwise. Land uses permitted within a scenic river area are enumerated. The Commissioner of Conservation cooperates with appropriate water pollution control agencies and environmental management agencies for the purpose of eliminating or diminishing the pollution of waters within scenic river areas. WETTING AGENT TESTS.
Los Angeles City Fire Dept., Calif.

Los Angeles, Los Angeles City Fire Department, 1969. 16 p, 4 fig, 3 tab.

Descriptors: *Surfactants, *Wettability, *Surface tension, *Sprays, *Burning, Wetting.
Identifiers: *Wetting agents, *Firefighting, *Fire extinguishing, *Fire departments, Los Angeles City Fire Department.

A series of laboratory and field tests of wetting agents, conducted by the Los Angeles City Fire Department, is reported. The tests were made to evaluate the effectiveness, cost and practicality of using wetting agents as additives to water for facilitating fighting class A fires. The function of the wetting agents is to decrease the surface tension of the water droplets, and thereby increase water spread over combustible surfaces. It was found that the time and amount of water required to extinguish fires were considerably lessened when wetting agents were used. The increased penetration of water into burning materials, when wetting were used, reduced the potential of rekindles. In addition, firefighting efficiency was increased and the use of wetting agents proved to be economically feasible. No significant correlations were found to exist between field and laboratory tests. It was concluded that a method of metering the wetting agent directly into the firefighting apparatus, from a reservoir on the apparatus, should be developed. Recommendations were made for optimum wetting agent concentrations. Additional tests and development were recommended. (Poertner-Chicago)
W70-03812

LIGHT WATER AND PROTEIN FOAM.
Los Angeles City Fire Dept., Calif.

Los Angeles, Los Angeles City Fire Department, 1968. 31 p, 6 fig, 6 tab.

Descriptors: *Burning, *Wetting, *Sprays, *Surfactant, *Foaming, *Airports.
Identifiers: *Light water, *Protein foam, *Foaming agents, *Firefighting, *Fire extinguishing, *Extinguishing agents, Fire departments, Los Angeles City Fire Department, Airport fires.

The report is a detailed account of a series of tests made by the Los Angeles City Fire Department to make comparative evaluations of firefighting characteristics of Light Water and Protein-Type foams. Light water is described as a non-toxic fluorocarbon surfactant with appropriate foam stabilizers. The Protein foam liquid agent is non-corrosive and contains stabilizers, metallic salts, and other materials and preservatives. Five sets of controlled tests were conducted in pits at the Los Angeles International Airport. The same firefighters were used for all tests and all firefighting was conducted under identical controlled conditions. Data were recorded on wind; temperature; humidity; amount and kind of fuel; temperatures of agent, water and fuel; fire intensity; time of preburn; time to control; time to extinguish; and amount of extinguishing agent used. The tests varied in size and intensity of fire, type of equipment used, and application rate of foaming agent. The Light Water foam proved superior to the Protein foam in every test. In one test, involving the use of two 300 gpm turrets on a 2,730 sq. ft. fire, the results indicated Light Water foam to be 3.64 times as effective as Protein foam. (Poertner-Chicago)

WATER CONSERVANCY DISTRICTS.

Mo Ann Stat secs 257.010 thru 257.150 (1959).

Descriptors: *Missouri, *Water districts, *Water conservation, *Water resources development, Water management (Applied), Water allocation (Policy), Administrative agencies, Legal aspects, Legislation, Water control, Flood control, Watersheds (Basins), Maintenance, River basins, Watershed management, River basin development, Multiple-purpose projects.

The purpose of a river basin conservancy district is to enable residents of the area to participate in maintaining and improving local water resources. District projects may include alleviation of floods, conservation of water against drought, and development of the state's resources for sanitary, domestic, agricultural, recreational, and industrial purposes. 'River' and 'river basins' are defined. The circuit courts are authorized to organize river conservancy districts upon petition by affected landowners. A majority of those owning land within the proposed district must approve its creation in a referendum. (Powell-Florida)
W70-04029

WATER CONSERVANCY DISTRICTS.
Mo Ann Stat secs 257.160 thru 257.310 (1959).

Descriptors: *Missouri, *Water conservation, *Water resources development, *Water districts, Water management (Applied), Water allocation (Policy), Administrative agencies, Construction, Maintenance, Legal aspects, Legislation, Water control, Water conveyance, Watercourses (Legal), Water distribution (Applied), Water works, Permits, Condemnation, Riparian rights, Easements, Right-of-way, Watersheds (Basins), River basins.

The board of trustees of a water conservancy district is authorized to clean out, straighten, widen, alter, deepen or change the course or terminus of any ditch, drain, sewer, river, watercourse, pond, lake, creek, or natural stream within the district. The board is empowered to fill up any abandoned or altered watercourse and to concentrate, divert, or divide the flow of water within the district. The board is permitted to purchase, acquire, hold, sell, convey, encumber, lease control, or use necessary land and personal property. The board may construct, operate, maintain, preserve, or supervise engineering works and other works, improvements and facilities. The board of trustees may acquire any easement, riparian or other right within the district for right of way, holding basin or for any necessary purpose. Condemnation of land by the board is permitted. The board of trustees makes regulations for the adjustment, connection or coordination of watercourses, works, facilities or operations of the district. The criteria and procedures for the creation of a conservancy district for a primary drainage basin are enumerated. (Powell-Florida)

PUBLIC UTILITIES.
Mo Ann Stat secs 71.520 thru 71.550 (1952).

Descriptors: *Missouri, *Public utilities, *Cities, *Municipal water, Legislation, Domestic water, Contracts, Supply contracts, Legal aspects, Regulation, Local governments, Electric power, Electricity, Water distribution (Applied), Fuels, Natural gas, Sewage disposal, Sewage, Conduits, Water works, Water supply, Pumping.

Municipalities may enact ordinances authorizing and regulating public utility companies supplying light, heat, power, water, gas, or sewage disposal facilities. A municipality may authorize these utilities to make excavations, set up fixtures, install mains, and maintain and operate their plants, subject to the conditions of the ordinance, for a period of twenty years. Municipal authorities are authorized to contract with any Missouri corporation for the purpose of supplying the municipality with gas, electricity, or water. It is provided, however, that any such contract shall not have legal force until ratified by a two-thirds majority of those voting in a municipal election. Any municipality may contract, either separately or in conjunction with another municipality or private corporation, with any corporation engaged in pumping and delivering water at wholesale for domestic consumption. A municipality may own, either separately or in conjunction with another municipality or private corporation, water mains through which to procure an adequate supply of water for its inhabitants. Before any such contract shall be entered into, the contract must be approved by a majority of all the voters voting thereon at a special election held for that purpose. (Schram-Florida)

PUBLIC HEALTH (MUNICIPAL WATER SUPPLY).
Mo Ann Stat secs 71.700, 71.710 (1952).

Descriptors: *Missouri, *Cities, *Water supply, *Water sources, Legislation, Permits, Taxes, Wells, Water wells, Spring waters, Regulation, Inspection , Control, Testing, Water pollution, Water pollution control, Public health, Water quality, Local governments, Water permits, Well permits.
Identifiers: Licensing.

All cities in the state are authorized to regulate and license all springs, wells, or other sources of water supply from which water is sold or offered to the public or shipped for sale. The cities may levy and collect license taxes and provide for the inspection and analysis of such water supplies. All cities are authorized to enact ordinances for the protection of all water supply sources from contamination or danger of contamination. (Schram-Florida)
W70-04036

MISSOURI SOIL AND WATER CONSERVATION DISTRICTS LAW.

Mo Ann Stat secs 278.060 thru 278.155 (1963), as amended, (Supp 1970).

Descriptors: *Missouri, *Soil conservation, *Water conservation, *Water districts, Administrative agencies, Administration, Financing, Legal aspects, Legislation, Adjudication procedures, Taxes, Eminent domain, Assessments, Cities, State governments, Federal government, Contracts, Equipment, Coordination, Agriculture, Conservation, Water policy, Water resources.

The State Soil and Water Districts Commission is created to administer the soil and water conservation districts. The Commission shall: (1) formulate general soil and water policies for the districts; (2) receive funds for, and control disbursements to, the districts; (3) provide for referendums for the establishment or disestablishment of districts; and (4) enter into agreements with, and cooperate with federal agencies. This act provides procedures for: (1) the establishment of soil and water districts; (2) referendums; and (3) the establishment of boards of soil and water district supervisors. Soil and water districts shall: (1) be a corporate body; (2) promote measures for soil and water conservation; (3) cooperate with other agencies; (4) provide services, materials and equipment to land representatives; (5) accept contributions and expend monies; and (6) enter into contracts. Counties, cities and soil and water districts may cooperate for the purposes of this act. Soil and water supervisors may not levy taxes, issue bonds, make assessments, take contributions by exaction from soil and water districts, or exercise the right of eminent domain. (Marsee-Florida)

AN EVALUATION OF THREE COEFFICIENTS AS A MEASURE OF UNIFORMITY OF WATER APPLICATION BY SPRINKLERS,
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
H. C. Korven.
Canadian Agricultural Engineering, Vol 10, No 2, p 83-84, Nov 1968. 1 tab, 7 ref.

Descriptors: *Sprinkler irrigation, *Application methods, *Uniformity coefficient, *Water measurement, Semiarid climates, Arid lands, Irrigation, Water management (Applied), Statistical methods, Measurement, Equations, Average, Spatial distribution, Regression analysis, Data processing, Rates of application.
Identifiers: *Canada, *Standard deviation, Saskatchewan.

When designing and operating a sprinkler irrigation system, it is important to know the uniformity of water application, since a level of uniformity is more efficient in using water for crop production. Three coefficients of uniformity that have had wide attention were calculated and compared for 775 uniformity tests on the semiarid plains of Saskatchewan. They were Cu, U, and A. The larger the coefficient, the better the uniformity. A high degree of correlation was found among the three coefficients. The author concludes that any of the three coefficients is an acceptable measure, but he suggests U is most practical since it is based on standard deviation--one of the most efficient estimators--and is easier to calculate. WATER FOR WESTERN FEDERAL IRRIGATION PROJECTS,
Washington State Univ , Pullman.
E. Roy Tinney
Water Resources Management and Public Policy, Seattle, University of Washington Press, p 3-11, 1968. 9 p, 3 ref.

Descriptors: *Water supply, *Economic efficiency, *Irrigation, *Water resource development, Water losses, Water transfer, Demand, Cost, Government, Governments supports, Groundwater mining, Optimization, Value, Cost benefit analysis, Financing, Economic life, Income, Social aspects, Economic evaluation.
Identifiers: *Federal subsidies, *Social goals, Income distribution.

The chief agricultural problem of the West is the supply of irrigation water. Future federal irrigation developments should attempt to assure the nation of a fully adequate supply of the varieties of food and fiber, improve the general economy, and aid specific economicallydepressed areas. The federal government should adopt both an economic efficiency analysis and an income distribution analysis and abandon the hidden subsidies in benefit-cost analysis. Future federal projects should be ranked in ascending order of economic efficiency for each crop pattern so that Congress can make a more rational selection, taking note of the social goals involved. The article points out that interregional transfers should be analyzed on the basis of technological obsolescence of demand, crop production factors in the area of water abundance, the relative costs of water delivery at each end of the transfer, water losses incurred by the transfer and alternative means of increasing the water supplies in the recipient regions. (See W70-03995) (Murphy-Rutgers)

EFFECTS OF FLOOD PROTECTION ON LAND USE IN THE COON CREEK, WISCONSIN, WATERSHED,
Wisconsin Bureau of State Planning, Madison.
Donald F. Theiler.
Water Resources Research, Vol 5, No 6, p 1216-1222, Dec 1969. 7 p, 2 fig, 5 tab, 3 ref.

Descriptors: *Flood protection, *Small watersheds, *Land management, *Land use, *Wisconsin, Cost-benefit analysis, Planning, Soil conservation, Recreation.
Identifiers: Coon Creek watershed (Wis).

In justifying small watershed projects under Public Law 566, the U.S. Soil Conservation Service (SCS) frequently counts as a benefit the intensified use of agricultural land resulting from increased flood protection. Actual land use changes in Wisconsin were far less than predicted by the SCS. The reasons are less related to the watershed project than they are to changes in farming practices. The adequacy of project evaluation techniques is questioned, and suggestions are made for improvement. (Knapp-USGS)

USE OF THE CRITICAL PERIOD IN RESERVOIR ANALYSIS,
California Univ., Los Angeles.
W. A. Hall, A. J. Askew, and W. W-G. Yeh.
Water Resources Research, Vol 5, No 6, p 1205-1215, Dec 1969. 11 p, 4 fig, 3 tab, 4 ref. OWRR Project No B-061-CAL.

Descriptors: *Probability, *Streamflow forecasting, *Statistical models, Synthetic hydrology, Hydrograph analysis, Statistical methods, Meteorology, Reservoir management, Systems analysis.
Identifiers: *Critical period analysis, Synthetic hydrographs.

The 'critical period' in conjunction with reservoir design and operation is defined and an analysis is conducted of the usefulness of the concept in the evaluation of deficiencies of water for project planning purposes. Streamflow records from a number of rivers in the United States are analyzed, and certain defined characteristics of their various critical periods are derived. These characteristics are shown to be functions of both the active storage and the variation in annual streamflow. The dates of occurrence of the critical periods from historical records tend to be stable within certain geographic areas and over a range of active storages. Large numbers of equally likely hydrographs of the same length as the historical record were generated and compared with those found in the historical record. Some of the synthetic records produced critical periods in which the severity, measured by the decrease in the full record firm yield, was greater than the historical. However, the generated records as a whole had significantly less severity than the historical records of the same length. These observations suggest, but do not prove, that the more severe critical periods observed in historical records may be due to major perturbations of the cause-effect relationships not reflected by the hypothesis of static probability relationship. WATERCOURSES (ALTERATION FOR BRIDGE CONSTRUCTION).

Ohio Rev Code Ann secs 6151.01 thru 6151.13 (Page, 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Bridges, *Streams, *Bridge construction, Legislation, Benefits, Public benefits, Project benefits, Washouts, Road construction, Rivers, Alteration of flow, Damages, Costs, Estimated costs, Diversion, Administrative agencies, Condemnation, Financing.

When necessary for the proper protection of location of a proposed bridge or road, the board of county commissioners may divert, alter, straighten or clean out any watercourse, acquire the necessary property, and settle all claims for damages. Expenses are payable out of the funds for the bridge or road. Before the work is begun, a petition setting forth the benefits to be derived from the project and other necessary details must be filed with the county auditor. An engineer is appointed to determine whether the proposal is beneficial and to estimate the costs. All costs for the proceedings are paid from the bridge funds of the county. (Douberley-Florida)

CORRECTION OF ERRORS IN ASSESSING DRAINAGE DISTRICT LANDS.
Tenn Code Ann secs 70-1001 thru 70-1007 (1956).

Descriptors: *Tennessee, *Drainage districts, *Assessments, *Remedies, Legislation, Payment, Evaluation, Taxes, Tax rate, Boundaries (Property), Boundary disputes, Legal aspects, Administration, Administrative agencies, Administrative decisions, Appraisals, Damages.

Mistakes in assessments against landowners made by drainage district authorities may be corrected upon petition by the aggrieved landowners to the county court. Either the landowner or the district directors may appeal the court's assessment decision. No petition for correction of a mistake in boundaries will be heard after the decree fixing the number of acres has been confirmed and entered on the assessment roll. When an incorrect assessment has been made, the decree fixing such assessment shall not be final and any aggrieved party may petition the county court to correct the mistake. Upon a finding that a mistkae was made, all reports, decrees, blue prints, maps, and plats shall be amended accordingly. An appeal from such a decision may be made to the circuit court, where the cause will be heard de novo. (Schram-Florida)
W70-03742

DRAINAGE DISTRICTS (CONSTRUCTION OF IMPROVEMENTS).
Tenn Code Ann secs 70-1201 thru 70-1232 (1956).

Descriptors: *Tennessee, *Administrative agencies, *Drainage districts, *Drainage engineering, Drainage systems, Drainage practices, Controlled drainage, Drainage, Laterals, Outlets, Legislation, State governments, Administration, Channels, Legal aspects, Watercourses (Legal), Relative rights, Ditches, Drains, Assessments, Construction, Conveyance structures.

The county court is empowered to appoint members to the board of directors of drainage districts. Each board may enter into contracts for improve-

ments in its district. A bonded engineer is to be employed to supervise construction of improvements and to file monthly work estimates upon which compensation will be based. Each board is directed to employ a 'drainage overseer' to efficiently maintain improvements constructed within its district. The owner of any land assessed for construction costs of an improvement has the privilege of using the improvement, subject to the control and approval of the board of directors. The board for each district is required to settle disputes between landowners regarding use of lateral ditches or drains. Each board may assess damages for violations of this act. Assessments for improvements are to be collected as taxes but must be kept in a separate fund. Criminal penalties are imposed for injury to any drainage improvement. (Barnett-Florida)
W70-03743

WATERS, DRAINS, AND LEVEES (DISTRICTS IN MORE THAN ONE COUNTY).
Tenn Code Ann secs 70-1501 thru 70-1514 (1956).

Descriptors: *Tennessee, *Drainage districts, *Administrative agencies, *Drainage practices, Drainage programs, Drainage systems, Local governments, State governments, Legislation, Regulation, Drainage engineering, Engineers estimates, Cost repayment, Administrative costs, Cost allocation, Construction, Assessments, Legal aspects, Project planning, Coordination, Administration, Permits.

Where a proposed drainage improvement is to be located in more than one county, application must be made to the county courts of each county. Upon application, a court appointed engineer will survey the entire area and report to each county in the district. The court is authorized to appoint viewers to assess damages to each county. County courts are directed to appoint commissioners to assess and apportion the costs of the proposed improvement. A board of directors for a district encompassing more than one county shall consist of one member from each county. County courts retain the power to remove any commissioner, viewer, or director. An alternate method of establishing improvement or drainage districts lying in more than one county is provided. (Barnett-Florida)
W70-03744

SWAMP AND OVERFLOWED LAND.
Mo Ann Stat secs 241.010 thru 241.130 (1952).

Descriptors: *Missouri, *Land reclamation, *Federal reclamation law, *Swamps, Patents, Legislation, Legal aspects, State governments, Standing waters, Surface waters, Reclamation states, Proprietary power, Public lands, Federal government, Conservation, Land development, Land management, Agricultural engineering.

Swamp and overflow lands were granted to the state of Missouri by an act of Congress entitled 'An act to enable the state of Arkansas and other states to reclaim the swamp lands within their limits.' In order to provide for the reclamation of all overflowed and swamp lands, all Missouri lands are donated to the counties in which they may be situated. The duties of the Secretary of State, which include acting as swamp land agent, are enumerated. Title to all swamp or overflowed lands is conveyed by patent issued by the Secretary of State. The preparation, issuance and recordation of patents are regulated. All patents are prima facie evidence of title. (Powell-Florida)
W70-03756

SWAMP AND OVERFLOWED LANDS (PATENTS AND CONTRACTS).
Mo Ann Stat secs 241.140 thru 241.240 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Swamps, *Patents, *Contracts, Control, Marshes, Surface waters, Land reclamation, Wetlands, Legal aspects, Legislation, Contract administration, Regulation.

Control over patented swamp and overflowed lands is vested in the several county courts. Procedures involving the sale of swamp or overflowed lands by the county are provided. The conditions necessary for the cancellation of swamp or overflowed land sale contracts are enumerated. The clerk of the county court issues a patent for the swamp or overflowed land upon full payment by the purchaser. (Powell-Florida)
W70-03757

SWAMP AND OVERFLOWED LANDS (RECLAMATION AND ASSESSMENT OF DAMAGES).
Mo Ann Stat secs 241.250 thru 241.280 (1952).

Descriptors: *Missouri, *Land reclamation, *Damages, *Overflow, Land, Legislation, Local governments, Swamps, Reclamation, Ditches, Levees, Drainage, Drainage systems, Administrative agencies, Payment, Surface drainage, Drainage programs, Judicial decisions, Legal aspects, Compensation, Assessments.

The county courts may appoint commissioners to superintend the surveying, draining, and reclamation of overflowed and swamp lands within the respective counties and may borrow money and issue bonds of the county for these projects. If the owners of any land through which any ditch or levee is proposed to be constructed or cut object to such construction, the commissioners shall obtain a summons for a jury to inquire into the damages the owners may sustain. A civil trial shall be conducted in a magistrate's court, and the jury's assessment of damages shall be specified in writing. If the county court determines that it is best to pay the damages, the money shall be paid to the landowner from the county treasury. If the objecting landowner refuses to accept the payment, the ditch or levee may be constructed, and the landowner shall be forever barred from maintaining any further action. Malicious destruction of any ditch or levee is a misdemeanor punishable by up to one thousand dollars fine and/or six months imprisonment. (Schram-Florida)
W70-03758

ANNEXATION OF OLD DRAINAGE DISTRICTS BY NEW DRAINAGE DISTRICTS.
Mo Ann Stat secs 242.692 thru 242.699 (Supp 1970).

Descriptors: *Missouri, *Drainage districts, *Outlets, *Boundaries (Property), Legislation, Legal aspects, Administrative agencies, Land tenure, Judicial decisions, Assessments, Taxes, Cost-benefit theory, Administration, Drainage systems.
Identifiers: *Annexation, Reorganization.

The drainage districts whcih desires to be annexed will be known as the minor district. The district to which the minor district desires to be annexed will be known as the major district. The board of supervisors of any minor district may petition any major district for annexation thereto providing the two districts have a common outlet or the major district has an outlet for the use of the minor district. The necessary contents of the petition are specified. The petition will be filed in the circuit court which incorporated the major district. The board of supervisors of the major district may either accept or reject the petition. If the petition is accepted, the clerk of the circuit court will publish notice thereof. Owners of land in the minor district may object to the petition and such objections will be heard in circuit court. The court will determine whether or not to issue a decree annexing the minor district to the major district. (Keith-Florida)
W70-03760

DRAINAGE DISTRICTS FOR MINING PURPOSES.

Mo Ann Stat secs 242.700 thru 242.750 (1952).

Descriptors: *Missouri, *Drainage districts, *Land reclamation, *Mining, Administrative agencies, Mine drainage, Land tenure, Leases, Easements, Pumps, Pumping plants, Pumping, Watercourses (Legal), Planning, Excavation, Taxes, Financing, Surveys, Legislation, Right-of-way, Legal aspects, Mining engineering, Mineralogy.
Identifiers: Underground watercourses.

When the state geologist certifies that certain lands are likely to contain valuable mineral deposits, owners of these lands may form a mining drainage district to drain their lands for mining purposes. Such districts shall have the power to purchase, construct, own or lease pumping plants in order to promote the draining and reclamation of mineralized lands. The chief engineer of any mining district shall make a survey of mineralized lands and submit a reclamation plan to the board of supervisors of the district outlining the methods of reclaiming the lands for mining purposes. The districts' projects shall be financed through the issuance of bonds and through the levy of a pumping tax on the gross value of mineral concentrates derived from the land. (Duss-Florida)
W70-03761

CONSOLIDATION OF DRAINAGE DISTRICTS.

Mo Ann Stat secs 243.450 thru 243.540 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Drainage districts, *Administrative agencies, *Judicial decisions, Land tenure, Financing, Benefits, Assessments, Costs, Taxes, Construction, Legislation, Legal aspects.
Identifiers: *Penalties (Criminal), Improvements.

Upon petition by one-fourth of the landowners in two or more drainage districts, such districts may reorganize into one district. Petitions shall be to the circuit court of the county containing the greatest acreage of land in the proposed district. Petitions shall contain descriptions of the land and districts involved. The clerk of the circuit court shall cause notice of the petition to be published. Any owner of real or other property in the proposed district, not signing the petition, may file objections to the petition which shall be reviewed by the court. Penalties are provided for officials who fail to carry out their duties to the district. The validity of bonds issued by districts shall not be questioned in any court, except for the power to issue such bonds. Suits on bonds for costs and performance of work shall be brought in the name of Missouri. Appeals from county court decisions regarding drainage districts shall be to the circuit court. This chapter is remedial in character and drainage districts already in existence retain all powers heretofore granted by the state. Penalties for violations of this chapter are provided. (Duss-Florida)
W70-03762

CITY OF PORT RICHEY V ADAMEK (CONSTRUCTION OF A DOCK EXTENDING INTO A NAVIGABLE RIVER).

228 So 2d 428-431 (2d DCA Fla 1969).

Descriptors: *Boundaries (Property), *Docks, *Local governments, *Navigable rivers, Legislation, Judicial decisions, Ownership of beds, Beds under water, High water mark, Real property, Channels, Shores, Permits, Legal aspects, Boundary disputes, Water rights, Shallow water, Building codes, Structures, Construction, Land tenure, Cities, Navigation, Regulation.

Plaintiff, a property owner, requested the court to determine the boundary of his waterfront lot and to require defendant city to permit construction of a dock extending from his property into a navigable river. An approved plat of the sub-division revealed that plaintiff's property line extended forty-one feet into the river. A municipal ordinance permitted boat docks and piers to extend no more than 20 feet into a waterway from the property line. Defendant claimed that the proposed dock would extend

more than twenty feet into the river and denied plaintiff's application for a building permit for that reason. The circuit court declared that plaintiff's property line was that shown on the plat and not the shoreline. Because the water immediately adjacent to the shoreline was shallow and non-navigable, the court held that the dock would not impede the natural flow of water, encroach upon the channel, or unduly restrict the use of the waterway by adjoining property owners. On appeal, the city claimed that Florida law permits private ownership of lands bordering on navigable waters only to the high water mark. The district court rejected this contention and affirmed the circuit court's decision, holding that construction of the proposed dock would not violate the city ordinance. (Schram-Florida)
W70-03763

KOMMANVITTSELSKAPET HARWI V UNITED STATES (ACTION AGAINST FEDERAL GOVERNMENT FOR ALLEGED FAILURE TO MAINTAIN CHANNEL).
305 F Supp 882-895 (ED Pa 1969).

Descriptors: *Navigation, *Navigable rivers, *Admiralty, *Channels, Ships, Shoals, Warning systems, Depth, Buoys, Publications, Federal government, Administrative agencies, Legal aspects, Federal jurisdiction, Interstate rivers, Delaware River, Surveys, Channel improvement, Dredging, Damages, Charts, Judicial decisions, Remedies.

Foreign shipowners brought this action for damages against the United States under the Suits in Admiralty Act. Plaintiffs charged that negligence on the part of the United States government led to the grounding of their vessel on a shoal in the Delaware River. Specifically, they contended that the United States had assumed the duty of maintaining and surveying the channel in which the ship was damaged and that the United States negligently failed to notify users of the Delaware River that the existing channel could not safely be used for navigation. Plaintiffs alleged further that the United States negligently failed to publish information concerning the depth of the channel and failed to mark and alternate channel with temporary markers during channel construction. The court rejected these contentions, holding that even if the federal government has assumed the responsibility for regularly surveying and maintaining the channel, there was no evidence that the government was aware of the existence of the particular shoal in question. The court stated that even though the Corps of Engineers periodically publishes depth charts for certain channels, this does not justify navigators in relying upon the government to dredge and survey all channels in navigable interstate waterways. (Schram-Florida)
W70-03766

PARTITION WHEN LAND BOUNDED BY WATER.
Wis Stat Ann sec 90.09 (1957).

Descriptors: *Wisconsin, *Boundaries (Property), *Boundary disputes, *Structures, Legislation, Negotiations, Rivers, Ponds, Streams, Legal aspects, Relative rights, Cost allocation, Cost sharing, Riparian land.
Identifiers: *Fences.

When the boundary line between enclosed lands of different persons is a river, brook, pond, or creek which does not form a sufficient fence, and it is impracticable because of unreasonable expense to build the fence on the true boundary line, and either owner refuses to join in making a partition fence on either side, application may be made to two fence viewers who will determine if the river, brook, pond, or creek is an insufficient boundary. If so determined, the viewers will put in writing how, when, and where the fence is to be erected along with an assessment of cost to each of the disputing owners. This paper is filed with the town clerk and recorded. If either party refuses or neglects to build his share of the fence, the other party may complete the fence and recover the expense thereof from the refusing party. If the viewers determine it impracticable to build any fence, written notice of such determination shall be given to the disputing parties. (Barnett-Florida)
W70-03786

WISCONSIN FLOOD CONTROL AGENCIES.

Wis Stat Ann secs 87.12-87.18 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Flood control, *Coordination, Legal aspects, Financing, Assessments, State governments, Reservoirs, Flood protection, Flood plains, Land tenure, Rivers, Maintenance, Operation and maintenance, Surveys, Leases, Construction, Construction costs, Repairing, Administration, Cities, Legislation, Cost allocation, Operating costs.

A Flood Control Board is hereby established to coordinate and supervise the construction, maintenance, and operation of flood control improvements authorized by the Department of Resource Development. The Board is authorized to: (1) contract for the construction of improvements; (2) enter upon lands to conduct surveys and examinations; (3) borrow money for reservoir construction; (4) sell or lease reservoirs; and (5) petition the Department for authorization to improve existing works. Penalties are provided for trespass upon, obstruction of, or interference with improvements. Leases, sales, and leases with options to purchase storage reservoirs may be secured only in accordance with the procedures herein established. Costs of maintenance and operation of flood control improvements are assessed against municipalities and owners of unincorporated land within the district. (Marsee-Florida)
W70-03789

WISCONSIN FLOOD CONTROL.
Wis Stat Ann secs 87.01-87.11 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Flood control, *Administrative agencies, *Administration, Financing, Costs, Assessments, Dams, Dikes, Diversion, Flood protection, Levees, Reservoirs, Sewers, Ditches, Lakes, Rivers, Navigation, Floodways, Pumping plants, Siphons, State governments, Federal government, Legal aspects, Parks, Legislation, Channel improvement, Alteration of flow, Obstruction to flow.

For purposes of flood control, the Department of Resource Development may straighten, widen, alter, or remove obstructions from any river, watercourse, lake, pond, creek, natural stream, ditch, drain, or sewer, and may concentrate, divide or divert the flow of water therein. However, no such work may substantially impair navigability. The Department may also construct, maintain, or remove ditches, canals, levees, dikes, dams, sluices, revetments, reservoirs, holding basins, floodways, pumping stations, sewers, siphons, and other works necessary for the purposes of this act. Procedures governing flood-work petitions and hearings are herein set forth, as are provisions relating to financing, costs, assessment of benefits, collection of assessments and exemption of public parks from assessments. Public corporations or flood control boards may enter into agreements with federal agencies to cooperate in the construction, operation or maintenance of any federally authorized project contemplated herein. Drainage area is defined. (Marsee-Florida)

FLOOD PLAIN INFORMATION, LOOKINGGLASS RIVER, CLINTON COUNTY, MICHIGAN.
Corps of Engineers, Detroit, Mich.

Prepared for Water Resources Comm, Mich Dept of Natural Resources and Tri-County Regional Planning Comm. Corps of Engineers Flood Plain Report, Dec 1969. 43 p, 8 fig, 34 plate, 12 tab.

Descriptors: *Floods, *Flood damage, *Michigan, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: *Clinton County (Mich), Standard project flood, Intermediate regional flood.

Flooding of the Lookingglass River, Clinton County, Michigan is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 69, p 556-564, 1967. 9 p, 7 fig, 2 ref.

Descriptors: *Water management (Applied), *Streamflow forecasting, *Reservoir design, *Reservoir operation, *Statistical methods, Probability, Regulation, Flood protection, Flood forecasting, Statistical models, Peak discharge, Rainfall-runoff relationships.
Identifiers: Drainage basin management.

There are many factors to be taken account of in designing various water works such as reservoirs and embankments, in which the hydrological quantities become the dominant factor. In estimating the occurrence probabilities of the quantities, multi-dimensional consideration is preferable to

the one-dimensional. The theoretical method of estimation of the exceedance probability by using the two-dimensional probability theory of normal distribution is discussed. The theoretical deduction of the joint exceedance probability is given and several methods available for estimation of the probability for the case where there are a flood-control reservoir and an embankment reach, are presented. As the results of this approach, it is shown that the exceedance probability taking account of the correlation among the related factors becomes smaller than that of the independent events. Descriptors: *Flood forecasting, *Small watersheds, *Statistical methods, *Peak discharge, Rational formula, Hydrologic budget, Rainfall-runoff relationships, Runoff forecasting, Streamflow forecasting, Evaluation.
Identifiers: Flood prediction formulas.

Five current methods for estimating flood peaks expected from ungaged rural drainages of small areas are discussed. Predictions are made with the 5 methods on 45 streams at 19 locations widely spaced across the United States. The methods were tested in arid as well as non-arid regions, beyond the geologic zones for which they were developed, and according to other criteria in a search for adaptability and generality. The scatter resulting from these considerations of 134 observed floods is discussed in the light of requirements and restrictions imposed by the authors of design techniques. Diagrams and statistics illustrate the uncertainties involved and show which methods under- or over-predict for this sample from nature. (Knapp-USGS)

Radmillo D. Markovic.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 72, p 581-588, 1967. 8 p, 3 fig, 4 ref. Bureau of Reclamation Contract No 14-06-D-5299.

Descriptors: *Streamflow forecasting, *Statistical methods, *Reviews, Regression analysis, Probability, Stochastic processes, Stage-discharge relations.
Identifiers: Streamflow probability.

Significant natural or manmade changes of climatic, physiographic, and other conditions influencing hydrologic phenomena may cause the sample means of hydrologic variables describing these phenomena to change. The statistical methods for discriminating these changes in the means of hydrologic variables are discussed. The methods were derived by employing either the target or target-control concept and by applying the univariate, bivariate, or conditional distribution function of target and control hydrologic variables. Each of the methods presented here may be applied under specified particular conditions. (Knapp-USGS)

DELTA AND PINE LAND CO OF MISSISSIPPI V BOARD OF SUPERVISORS OF BOLIVAR COUNTY (LEASING OF LEVEE DISTRICTS LAND).

228 So 2d 893-896 (Miss 1969).

Descriptors: *Mississippi, *Levees, *Leases, *Administrative decisions, Bids, Floods, Alluvium, Flood control, Flood protection, Legislation, Administrative agencies, Real property, State governments, Land management, Mississippi River, Jurisdiction, Legal aspects, Contracts, Land tenure, Judicial decisions.
Identifiers: *Alluvium lands, *Levee districts.

Pursuant to a special statute regulating the leasing of lands within levee districts, the Board of Supervisors leased two sections of land to the person who had submitted the highest sealed bid. The holder of the previous leases appealed the order of the Board, contending that because they submitted bids in excess of the highest sealed bids after learning the amount thereof, they were entitled to the leases. The Supreme Court of Mississippi affirmed the Board's order and held that the regulatory statute was not unconstitutional for failing to give preference to previous leaseholders. Appellant pointed out that another statute regulating the leasing of government lands contained provisions for giving preference to previous leaseholders, and contended that the statute should be applied to this leasing arrangement. Rejecting this contention, the court held that the state had legitimately classified lands composed of alluvium soil into levee districts, and the special statute regulating the leasing of 16th section lands located within these districts should control. Alluvium lands are defined as those built by deposits of sediment from streams and floods. (Schram-Florida)
W70-03907

COSTS AND MAINTENANCE OF DRAINAGE DISTRICTS.

Mo Ann Stat secs 243.320 thru 243.440 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Administrative agencies, *Drainage districts, *Financing, Legislation, Ditches, Drains, Levees, Maintenance, Maintenance costs, Costs, Cost allocation, Benefits, Taxes, Construction, Boats, Dredging, Assessments, Excavation, Land tenure, Real property, Regulation, Railroads, Roads.
Identifiers: Penalties (Civil), Dredge boats, Liens.

The cost of drainage ditches shall be apportioned to the entities owning the public roads of railroads which are benefitted. The county court has the duty to levy a maintenance tax to maintain the work of the drainage district. A portion of this tax may be set aside for the purchase of dredge boats, tools, or other machinery necessary for maintenance of the drainage district. Various provisions outline the payment of drainage taxes for district improvements and the method of administering the maintenance tax. All drainage taxes including maintenance taxes, penalties, and costs of collection constitute liens upon the property taxed until the taxes are paid. The county court may prorate surplus funds back to the taxpayers or use them for maintenance in lieu of maintenance taxes. The county court may issue bonds to finance the costs of drainage improvements. Regulations regarding the issuance of bonds are provided. Such bonds may be pledged to any corporation, commission or agency created or authorized by Congress or the state of Missouri. (Duss-Florida)
W70-03912

DRAINS, DRAINAGE PROCEEDINGS, AND DRAINAGE DISTRICTS.

Wis Stat Ann secs 88.01, 88.03, 88.08, 88.09, 88.12-88.17 (Supp 1969).

Descriptors: *Wisconsin, *Drainage, *Drainage districts, *Drains, Regions, Governments, State governments, Administrative agencies, Legal aspects, Costs, Cost allocation, Jurisdiction, Drainage engineering, Drainage programs, Administration, Tiles, Pipes, Pumping, Ditches, Water control, Legislation, Drainage practices, Water conveyance, Supervisory control (Power), Diversion, Surface drainage, Surface runoff.

Drainage proceedings are quitable in nature. The county court maintains supervisory control over the actions of the drainage board, and may require the board to submit reports of its proceedings. Provision is made for the taxing of costs in drainage proceedings. Decisions of the drainage board may be appealed to the supreme court of the state. When a proposed drainage area covers portions of more than one county, the county containing the greatest acreage proposed for drainage has jurisdiction over the organization and operation of the district. 'Drain' means any device used for the drainage of water from land or the protection of land from surface water, including open ditches, tiles, pipelines, pumps, and levees. (Marsee-Florida)

RESERVOIR SYSTEM DESIGN OPTIMIZATION,
Esso Research and Engineering Co., Florham Park, N.J. Environmental Control.
Richard J. Butsch.
Proceedings of ASCE, J Hydraul Div, Vol 96, No HY 1, p 125-130, Jan 1970. 1 tab, 8 ref, 2 append.

Descriptors: *Optimization, *Reservoir design, *Linear programming, *Dynamic programming, *Decision making, Locating, River basins, Size, Benefits.
Identifiers: Operating Criteria.

The optimization of a reservoir system by the use of selective mathematical techniques was discussed. A method was described by which optimum sizes, number and locations of reservoirs in a river basin could be determined. A variety of optimization techniques were used to evaluate promising designs on the basis of greatest economic benefits. Three levels of decision were required: (a) choosing the number and locations of reservoirs, (b) choosing size and operating criteria, and (c) the optimizing operation. Each level was optimized in turn, the optimization of lower levels being nested within higher ones. Techniques were chosen on the basis of their efficiency in each part of the design. Linear programming was used to optimize operations, dynamic programming used to optimize total benefits and optimum seeking methods used for optimizing decision variables. (Thiuri-Cornell)

Identifiers: *Central Valley, Local agencies, State agencies, Federal agencies.

ndings are reported concerning the development f surface waters of the Central Valley of Califor-a. Chief concern are the quality of the per-rmance of local, state and federal water agencies ith respect to the level of water resource develop-ent and the allocation of water among types, sites nd times of use. Discussion is concerned with the conomic efficiency in these respects of local water gencies as one group and the federal agencies gether with the California Department of Water esources as another. It also brings out some ap-arent historical and structural reasons for dif-rentials in economic efficiency between the two roups of agencies. The best case for comprehen-ve river-basin development by a central agency is here appreciable settlement and prior water evelopment is absent. (See W70-03995). Murphy-Rutgers)

4B. Groundwater Management

UPCONING OF FRESH WATER-SEA WATER INTERFACE BELOW PUMPING WELLS, FIELD STUDY,
Ministry of Agriculture, Jerusalem (Israel). Hydrological Service; and Water Planning for Israel Ltd., Tel-Aviv.
S. Schmorak, and A. Mercado.
Water Resources Research, Vol 5, No 6, p 1290-1311, Dec 1969. 22 p, 24 fig, 1 tab, 11 ref.

Desriptors: *Saline water intrusion, *Aquifers, *Saline water-freshwater interfaces, *Water level fluctuations, Encroachment, Mixing, Diffusion, Dispersion, Groundwater movement, Pumping, Withdrawal, Mathematical models, Mathematical studies.
Identifiers: Nomograms, Cone of depression.

Field investigations on the upconing mechanism of interface under the influence of pumping were car-ried out to check the validity of the existing theoretical formulas, to study the salinization of pumped water as related to the position and characteristics of the interface, and to provide some analytic design procedures for skimming fresh water from above saline water bodies. Exist-ing theoretical formulas describing the upconing interface are in agreement with field results up to some critical rise of the interface, which seems to be approximately half the distance between the bottom of the well and the undisturbed interface. In addition, the use of the linear approximation for the dispersion pattern was justified as a first ap-proximation of the resultant transition zone. The salinization of the pumped water is probably caused by the intrusion of saline water above a critical depth. From correlation analysis, the salini-ty increase of pumped water is about 5 to 8% of the average salinity of the saline water intruded above the critical depth. Design procedures based both on theoretical formulas and field investigations are summarized in the form of nomograms. These nomograms were constructed on the assumption that the mixing mechanism for other geometries is similar to the observed one. (Knapp-USGS)

COST, PRECISION, AND VALUE RELATION-SHIPS OF DATA COLLECTION AND DESIGN ACTIVITIES IN WATER DEVELOPMENT PLANNING,
California Univ., Berkeley. Hydraulic Lab.
Stephen V. Allison.
Hydraulic Lab Tech Rep 6-27, Univ of Calif, Berkeley, Water Resources Center, Contrib No 120, May 1967. 142 p, 12 fig, 17 tab, 24 ref, 3 ap-pend.

Descriptors: *Mathematical models, *Optimiza-tion, *Water resources development, *Planning, *Decision making, Costs, Design, Data collections, Reservoirs, Budgeting, Constraints, Groundwater, California.

The problem of allocating available resources between the many diverse activities required in water development planning was presented. The problem could be formulated either in terms of maximizing overall precision subject to a fixed budget constraint, or minimizing the cost of attain-ing a specified degree of overall precision. A method of solution based on mathematical decision techniques was proposed and tested on the activi-ties involved in the modelling of groundwater reser-voirs. These concepts were used to build a mathe-matical model of the groundwater reservoir under-lying the southern end of the San Joaquin Valley in California. Optimal programs of collecting and manipulating the required data were defined and the applicability of mathematical decision techniques to the solution of these problems was demonstrated. SELECTED ANALYTICAL METHODS FOR WELL AND AQUIFER EVALUATION,
Illinois State Water Survey Div., Urbana.
William C. Walton.
State Water Survey Div, Urbana, Ill, Bulletin 49, 1962. 81 p, 76 fig, 25 tab, 165 ref, 6 append.

Descriptors: *Mathematical models, *Aquifer characteristics, *Wells, *Hydrologic budget, *Il-linois, Groundwater, Simulation analysis, Op-timization, Geohydrologic units, Recharge, Pump-ing, Well spacing.
Identifiers: Image-well theory.

The practical application of selected analytical methods and mathematical models to well aquifer evaluation problems in Illinois was described. The subject matter included formulas, methods and models used to quantitatively appraise the geohydrologic parameters affecting the water-yielding capacity of wells and aquifers, and their response to heavy pumping. Several methods for

evaluating recharge rates involving flow-net analysis and hydrologic and groundwater budgets were described in detail. Optimum well spacings were estimated taking into consideration aquifer characteristics and economics. Simulation analysis techniques were used to formulate a model aquifer. The image-well theory and the appropriate groundwater formulas were used to construct a mathematical model which provided a means of evaluating the performance of wells and aquifers. (Thiuri-Cornell)

4D. Watershed Protection

WATERSHED DISTRICTS.

Tenn Code Ann secs 70-1801 thru 70-1849 (Supp 1969).

Descriptors: *Tennessee, *River basin commissions, *Watershed management, *Administrative agencies, Legislation, Drainage, Projects, Erosion control, Legal aspects, Construction, Maintenance, Water conservation, Land management, Water control, Water utilization, Drainage systems, Flood control, Water management (Applied), Reservoir construction, Reservoirs, Dikes, Levees, Recreation facilities.

Each watershed district is authorized to conserve soil and water and to retard floods and develop the water resources of the district. Watershed districts contract for the construction of proposed works and improvements. Watershed districts are empowered to construct drainage works or improvements and any works or improvements for the control, retention, diversion, or utilization of water. The watershed districts have authority to: retard runoff of water and soil erosion; construct ditches, channel improvements, dikes, levees, flood prevention reservoirs, water conservation reservoirs, irrigation reservoirs, facilities, parks, and other recreational facilities; and to repair, improve, and maintain any of said improvements or structures. A district may acquire land by gift, purchase or eminent domain. A district may acquire water rights and distribute or sell water for irrigation or other purposes. A district may provide recreational facilities. A study of the watershed area is conducted upon the incorporation of a watershed district. The matters to be determined by the court at a hearing on a petition for organization of a watershed district are enumerated. (Powell-Florida)

WATERSHED DISTRICTS.

Ohio Rev Code Ann secs 6105.01 thru 6105.99 (Page Supp 1970).

Descriptors: *Ohio, *Watershed management, *River basin commissions, *Water management (Applied), State governments, Legislation, Administrative agencies, Water utilization, Channels, Water zoning, Water districts, Public utility districts, Conservation, Permits, Regulation, Channel improvement, Floodways.
Identifiers: Organization, Administrative procedures.

Terms dealing with watershed districts including water resources, beneficial use, channels and restricted channels are defined. Procedural details are outlined for establishing watershed districts. The board of directors of the district is empowered to: (1) review and recommend plans for the development of water resources; (2) recommend means of resolving conflicts between water users; (3) make studies and review plans for the development of water resources; (4) prepare a comprehensive plan for beneficial use of water to submit to state agencies; (5) counsel and advise public agencies on water problems; (6) enter contracts; (7) issue permits to restrict certain floodways; (8) issue construction permits for alteration of any floodway; and (9) petition for the creation of a conservancy district. Permission of the board is required before building any dam or boring any well. Certain areas may be designated as restricted channels. (Barnett-Florida)

SOIL AND WATER CONSERVATION DISTRICTS.

Wis Stat Ann secs 92.02-92.05, 92.08, 92.14, 92.15 (1957), as amended, (Supp 1969) 92.18, 92.20 (Supp 1969).

Descriptors: *Wisconsin, *Soil conservation, *Erosion control, *Administrative agencies, Legal aspects, Legislation, Agricultural engineering, Sediment control, Soil erosion, Water conservation, Soil management, Soil stabilization, Flood control, Operation and maintenance, Land tenure, Agriculture, Coordination, State governments, Watershed management, Surface runoff, Flood protection, Drainage.

The Soil and Water Conservation Committee is hereby established to conserve the soil resources of Wisconsin and to prevent damage to the soil from erosion, sediment, or floodwater. The Committee is directed to assist supervisors of soil conservation districts, approve and coordinate the activities of the districts, and disseminate information concerning soil conservation. County boards of supervisors may establish soil conservation districts. These districts are empowered to acquire property for watershed protection. flood prevention works, and recreational improvements. The districts may carry out measures for flood prevention or for agricultural phases of water control including the construction and operation of any necessary strucutres. Soil conservation districts are authorized to develop comprehensive plans for soil conservation and water utilization, enter lands to make surveys, and provide landowners with equipment, fertilizers, seeds and seedlings for soil conservation purposes. Provision is made in the act for the discontinuance of the districts. State agencies are instructed to cooperate with the districts in matters related to soil conservation. (Marsee-Florida)

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

USER TRIALS OF A SUBMERSIBLE WATER QUALITY RECORDING METER,
Ontario Water Resources Commission, Toronto. Great Lakes Survey Program.
M. D. Palmer.
Ontario Water Resources Commission, Great Lakes Surveys Program, 1969. 32 p, 6 fig, 2 tab, 5 ref, 5 append.

Descriptors: *Water quality, *Monitoring, *Instrumentation, Water pressure, Water temperature, Hydrogen ion concentration, Turbidity, Conductivity, Dissolved oxygen.
Identifiers: Water quality meters.

Two submersible recording water quality meters were field tested in the Great Lakes for accuracy and stability. These meters are battery operated and completely self-contained in a sealed stainless steel tube 16.5 cm in diameter by 76.2 cm long, weighing 21 kilograms. Temperature, pressure, real time, turbidity, pH, conductivity and dissolved oxygen are automatically evaluated every five minutes to one hour and recorded on magnetic tape. The information can also be transmitted to the water surface via line for telemetering. The meters have proven to be both flexible and reliable in water quality monitoring and model development programs. (Knapp-USGS)

COMPARISON STUDIES OF WINKLER VS. OXYGEN SENSOR,
Decatur Sanitary District, Ill.
Jeremiah F. Reynolds.
Journal Water Pollution Control Federation, Vol 41, No 12, p 2002-2009, Dec 1969. 8 p, 8 tab, 7 ref.

Descriptors: *Dissolved oxygen, *Water analysis, *Laboratory tests, Water quality, Instrumentation, Monitoring, Sewage treatment, Waste treatment.
Identifiers: Dissolved oxygen sensor.

Determinations of dissolved oxygen levels in wastewater treatment and effluent disposal are of great use in a number of ways. In-plant laboratory studies of using a polarographic oxygen sensor in comparison with the more common Winkler method were conducted. Advantages found were (a) the preparation and standardization of reagent solution are eliminated; (b) time spent in analysis is reduced; (c) the method is less tedious; and (d) correlation with the Winkler method is excellent. Laboratory experiences and data support these conclusions. (Knapp-USGS)

SURFACE SLICKS AS CONCENTRATORS OF PESTICIDES IN THE MARINE ENVIRONMENT,
Miami Univ., Fla. Inst. of Marine Sciences.
Douglas B. Seba, and E. F. Corcoran.

Pesticides Monitoring Journal, Vol 3, No 3, p 190-193, 1969. 1 fig, 2 tab, 21 ref.

Descriptors: *Pesticides, *Surface waters, Oceans, Distribution, Florida, DDT, Winds, Dusts, Fish, Gulls, Plankton, Ecology, Productivity, Photosynthesis, Dieldrin, Aldrin, Flood control, Canals, Sampling, Farm wastes.
Identifiers: *Marine environment, *Slicks, *Concentrators, Biscayne Bay (Fla), Florida Current, DDE, Barbados (West Indies), Clupeidae, Engraulidae, Dolphins, Miami River (Fla), Turkey Point (Fla), Acetone, Butyraldehyde, Leptopel, Trade winds.

Slicks, or calm streaks on a rippled sea, are often seen on coastal waters and lakes and have been observed throughout the oceans. Formed by the ripple-damping action of a surface film of organic matter which occurs naturally on biologically reproductive waters, they are effective concentrators of persistent chlorinated pesticides and indicate presence of pesticides when they are undeterminable in surrounding waters. Because of high biological activity associated with slicks and their occurrence in oceans, these findings may be of considerable importance in understanding pesticide distribution in the marine ecosphere. Pesticides apparently exist in very low concentration in open oceans. Findings that acetone, butyraldehyde and 2-butanone, common to all samples, were barely concentrated, if at all, while pesticides were concentrated by several orders of magnitude, demonstrate that slick enrichment is a highly selective fractionation and may be of considerable ecological importance. Biological activity was very intense in water immediately under the slicks in comparison to surrounding water. Slicks could often be located by noting the feeding of sea gulls on fish. Descriptors: *Ecology, *Yeasts, New York, Vermont, Depth, Fungi, Nitrates, Temperature, Sampling, Effluents, Mills, Methane, Sludge, Iced lakes, Hydrography, Density, Pollutants, Oxygen, Light intensity, Thermal water.
Identifiers: *Lake Champlin (NY), Cryptococcus albidus, Rhodotorula rubra, Endospores, Rhodotorula glutinis, Aureobasidium pullulans, Cephalosporium, Hyalodendron, Rhinocladiella, Particulate matter, Candida krusei, Trichosporon penincillatum, Saccharomyces, Pichia, Trichoderma viride, Cellobiose, Hansenula californica, Hanseniaspora uvarum, Anionic alkylbenzene sulfonates, Cellulolytic fungi, Yeast distribution, Paper mill wastes, Water pollution identification.

Fifty-seven water samples collected from Lake Champlain, New York (August 1968) showed that yeasts and yeast-like fungi occurred randomly from the surface to depths of 115 meters, usually in concentrations yielding less than five colonies per 100 milliliters. Their highest concentrations generally occurred near the surface, but at some stations 15 to 70 cells/100 milliliters were found at intermediate and lowest depths. Most widespread fungi were representatives of Cryptococcus albidus, Rhodotorula rubra, R glutinis, and Aureobasidium pullulans while inshore sites appeared to possess distinct populations. Highest yeast densitities (more than 400 cells/100 milliliter) were observed at stations receiving heated effluents from a paper mill, with large numbers of a yeast not observed elsewhere. Animal associated yeasts were rarely isolated from urban areas. Regions influenced by urban sewage yielded predominantly Hansenula californica and Hanseniaspora uvarum. Monthly samples demonstrated that yeast populations were present throughout the year with maximal densities occurring during two successive winters, occasionally under iced conditions. No correlations were observed between yeast densities and various hydrographic conditions. Distributive patterns of certain species suggest the feasibility of using yeasts as indicators of specific water pollutants. (Jones-Wisconsin)

5B. Sources of Pollution

STATISTICAL EVALUATION OF SALINITY AND NITRATE CONTENT AND TRENDS BENEATH URBAN AND AGRICULTURAL AREA-FRESNO, CALIFORNIA,
Agricultural Research Service, Fresno, Calif. Groundwater Recharge Field Station.
Harry I. Nightingale.
Groundwater, Vol 8, No 1, p 22-28, Jan-Feb 1970. 7 p, 6 fig, 5 tab, 8 ref.

Descriptors: *Water pollution sources, *Groundwater, *California, *Nitrates, *Salinity, Water wells, Aquifers, Irrigation water, Fertilizers, Urbanization, Statistical methods, Surveys, Conductivity, Farm wastes, Regression analysis.
Identifiers: Fresno (Calif).

The salinity and nitrate content of well water for an urban zone (Fresno-Clovis, California) and the immediate surrounding irrigated agricultural zone were compared using data for 1950 through 1967. Time trends in these water chemical properties were evaluated statistically by dividing the 18-year period into three 6-year periods. Salinity of the urban zone groundwater has increased with time, whereas that of the agricultural zone has fluctuated considerably. Possible reasons for changes are discussed. The nitrate content of well water from both zones has increased with time, with water from the agricultural zone showing the greatest increase. (Knapp-USGS)

CONSERVING RESOURCES AND MAINTAINING A QUALITY ENVIRONMENT,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.
Cecil H. Wadleigh, and Clarence S. Britt.
Journal of Soil and Water Conservation, Vol 24, No 4, p 172-175, Oct 1969. 4 p, 4 ref.

Descriptors: *Water resource development, *Water pollution, *Eutrophication, Government supports, Soil conservation, Industrial wastes, Municipal wastes, Fertilizers, Pesticides, Soil erosion, Animal wastes, Economics, Nitrogen, Water conservation.
Identifiers: *Soil runoff, Livestock.

Some of the problems involved in natural resource conservation are presented, with particular emphasis on the water pollution caused by agricultural runoff and livestock production. It is pointed out that the economics of the farming and livestock industry are often in conflict with the conservationists' interests. It is suggested that the Dept of Agriculture adopt a cost-sharing program to encourage solutions to some of the problems. The article emphasizes the dangers of eutrophication induced by animal wastes. The author concludes with a statement of some of the accomplishments of the conservation movement in the area of soil and water resources. (Murphy-Rutgers)

ENVIRONMENTAL TRITIUM STUDIES AT THE NATIONAL REACTOR TESTING STATION,
Atomic Energy Commission, Idaho Falls, Idaho.
D. B. Hawkins, and B. L. Schmalz.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 157-158, 1967. 2 p.

Descriptors: *Tritium, *Radioisotopes, *Radioactivity techniques, *Tracers, Nuclear reactors, Environmental effects, Water pollution, Lakes, Forecasting, Statistical methods, Idaho.
Identifiers: *Tritium contamination, National Reactor Testing Station, Salt Lake City.

The extent to which the National Reactor Testing Station (NRTS) in southeastern Idaho has contributed to the over-all tritium contamination of the environmental waters is discussed. The total quantity of tritium that fell on this region was similar to the tritium concentration in Salt Lake City, Utah. It was concluded that NRTS operations have not contributed noticeably to the over-all tritium contamination of this region. Tritium was used in calculating the average rate of groundwater movement at the NRTS; the movement averages about 13 ft/day. A log-normal plot of the cumulative percent frequency of tritium versus time was found to be useful in predicting the mean velocity of groundwater. (Carstea-USGS)

USE OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES: CHAPTER III,
Northeastern Univ., Boston, Mass. Dept. of Civil Engineering.
Alvin Goodman, and Richard J. Tucker.
FWPCA, Research Series Report ORD-6, p 19-41, July 1969. 2 fig, 9 tab.

Descriptors: *Mathematical models, *Water quality control, *Sewage treatment, *Optimization, *Decision making, *Biochemical oxygen demand, Dissolved oxygen, Simulation analysis, Computers, Economics, Design.
Identifiers: Sensitivity analysis.

A steady state mathematical model was applied to a study of a water pollution control program. Input data for the steady state model included hydraulic constants and stream purification rate constants for each reach of the river, population and economic information for each community and assumptions with respect to administrative decisions. For various levels of sewage treatment for each community, a computer program evaluated water quality throughout the length of the stream, and the costs and benefits of the water pollution control program. An optimizing routine determined desirable levels of sewage treatment for each river section in accordance to a specified water quality criteria. A sensitivity analysis by computer simulation was carried out, in which the biochemical oxygen demand and dissolved oxygen parameters were investigated within a possible range. The resulting river water qualities, degrees of treatment, and economic effects, in combination, formed a picture of how different assumptions might affect the ultimate design. (See Vol. 3, No. 9, Field 5C, entry W70-03488). (Thiuri-Cornell)
W70-03933

USES OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES: CHAPTER IV,
Northeastern Univ., Boston, Mass. Dept. of Civil Engineering.
Alvin Goodman.
FWPCA, Research Series Report ORD-6, p 42-64, July 1969. 23 p, 5 fig.

Descriptors: *Mathematical model, *Water pollution control, *Biochemical oxygen demand, *Dissolved oxygen, *Waste assimilative capacity, Coliforms, Chlorides, Upstream, Time, Unsteady flow, Variability.
Identifiers: Unsteady state model.

A time varying mathematical model was developed and used in a water pollution study. The objective of the model was to make maximum use of data obtained from records and field surveys of the Merrimack River, and to produce the results needed to examine the effectiveness of water pollution control programs. Techniques were developed for tracing a time profile of flow and quality in terms of biochemical oxygen demand, dissolved oxygen, coliforms, and chlorides, while the upstream discharge, water temperature, and solar radiation were changing. The time varying model was used to investigate the effectiveness of an assumed configuration of treatment plants when the stream's assimilative capacity varied with distance and time. (See Vol. 3, No. 9, Field 5C, entry W70-03488). (Thiuri-Cornell)

CARBON SOURCES IN ALGAL POPULATIONS AND ALGAL COMMUNITY STRUCTURE,
Oklahoma Water Resources Research Inst., Stillwater.
Troy C. Dorris.
Available from the Clearinghouse as PB-189 523, $3.00 in paper copy, $0.65 in microfiche. Research Project Technical Completion Report, Oklahoma WRSIC Institute (1969). 10 p, 1 fig, 2 tab. OWRR Project No B-005-OKLA.

Descriptors: *Carbon, *Algae, *Population, *Biological communities, Effluents, Eutrophication, Phytoplankton, Decomposing organic matter, Oklahoma, Reservoirs, Sampling, Industrial wastes, Municipal wastes, Sewage, Adsorption, Activated carbon, Filters, Seasonal, Stratification, Biochemical oxygen demand, Carbon radioisotopes, Detergents, Antifreeze, Oxidation, Photosynthesis, Oil wastes, Garbage dumps, Pigments, Dams, Physicochemical properties, Chlorophyll.
Identifiers: Arkansas River (Okla), Tulsa (Okla), Pollution, Fossil, Cimarron River (Okla), Bixby (Okla), Keystone Reservoir (Okla), Carotenoids.

A portion of a study to determine source and distribution of organic compounds in the Keystone Reservoir, Oklahoma, and the development of phytoplankton populations in response to eutrophication processes resulting from decomposition of organic compounds in effluents entering the Cimarron arm of the reservoir is described. Organic compounds from industrial and municipal sewage effluents were sampled by adsorption on activated carbon filters at six stations to develop information on seasonal changes in quantity and nature of organic compounds, effect of stratification on movement and changes of compounds, and pollution of the Arkansas River by effluents from Tulsa. The effort to identify particular compounds, trace their progress through the reservoir and determine extent of their degradation by passage through the reservoir is expected to be completed with further study. Extraction of adsorbed compounds from carbon filters has been accomplished but data were incomplete. Phytoplankton studies on the Cimarron arm of the reservoir were designed to study effects of eutrophication of the water by domestic and industrial effluents. The full spectrum of photosynthetic and other pigments was measured as each sample was taken. Efforts were made in species identification. (Jones-Wisconsin)

5C. Effects of Pollution

BIOLOGICAL EFFECTS OF HANFORD HEAT ON COLUMBIA RIVER FISHES - A REVIEW,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
R. E. Nakatani.
US Atomic Energy Commission, BNWL-SA-1682, 1968. 24 p, 12 fig, 1 tab.

Descriptors: *Heated water, *Temperature, *Nuclear reactors, *Fish behavior, Salmon, Trout, Cooling water, Thermal pollution, Path of pollutants, Fish, Chinook salmon, Thermal powerplants, Columbia River.
Identifiers: Hanford reactor, Priest Rapids Dam.

To obtain information on the effects of heated discharges from the reactors at Hanford, Washington, on fish in the Columbia river, the temperature tolerance of young chinook salmon exposed to 7 different temperatures was investigated; the lowest temperature was similar to the average river temperature at Priest Rapids dam, and it was found that increased temperature resulted in increased body weight. Adult salmon and steelhead trout were fitted with sonic tags so that their behavior in the vicinity of the waste-water plumes could be detected; the results showed no evidence of a temperature block, but the fish tended to migrate upstream along the opposite bank from the reactor sites. (Rietveld-Vanderbilt)
W70-03721

THE RELATION OF TEMPERATURE TO OXYGEN CONSUMPTION IN THE GOLDFISH,
Toronto Univ. (Ontario).
F. E. J. Fry, and J. S. Hart.
The Biological Bulletin, Vol 94, No 1, p 66-77, 1948. 6 fig, 2 tab, 17 ref.

Descriptors: *Oxygen requirements, *Temperature, Fish, Metabolism, Fish behavior, Oxygen.
Identifiers: *Goldfish, Standard metabolism, Maximum oxygen uptake.

Two levels of oxygen uptake in the goldfish were measured at temperatures from 5 deg C to 35 deg C. The lowest point in the resting metabolism in the daily cycle was taken to be the standard rate and was measured over levels of oxygen high enough to avoid any dependence of the rate on oxygen tension. The maximum steady rate of oxygen uptake found when the fish were stimulated to activity in a rotating chamber was measured over a series of oxygen tensions down to the asphyxial level. The standard rate continued to increase with temperatures up to 35 deg C, while the maximum rate was found by interpolation to reach its highest value at about 30 deg C and to remain steady or decrease slightly at higher temperatures. The maximum rate of oxygen uptake became dependent upon the oxygen tension between 15 and 40 mm Hg, depending upon the temperature. Oxygen tensions at which the maximum oxygen uptake met only the needs of the standard metabolism were estimated to be between 4 and 25 mm Hg over that same range of temperatures. The difference between the maximum and standard metabolic rates was correlated with the rate at which goldfish can swim steadily at the various temperatures, and it was concluded that the drop in the sustained swimming rate of the goldfish at temperatures from 30 deg C to 38 deg C was probably due to a decrease in the metabolism available for external work rather than to the thermal destruction of enzymes. (Speakman-Vanderbilt)
W70-03722

THE EFFECT OF DIETARY FAT ON THE HEAT TOLERANCE OF GOLDFISH (CARASSIUS AURATUS),
British Columbia Univ., Vancouver. Dept. of Zoology.
W. S. Hoar, and J. E. C. Dorchester.
Canadian Journal of Research, Sect D, Zool Sci, Vol 27, p 85-91, 1949. 3 fig, 1 tab, 12 ref.

Descriptors: *Heat resistance, *Diets, Fish, Temperature, Fishkill, Mortality, Fish diets.
Identifiers: *Goldfish, Fats, Unsaturation.

Three groups of goldfish were acclimated at 20 deg C and fed diets containing 25% fat. The diets for the three groups differed in the degree of unsaturation of these fats. Pilchard oil, herring oil, and lard were the fats used. Heat tolerance of the fish was then tested by holding them at a constant temperature of 36 deg C and observing the time of death. Variations in the ability of the groups to withstand high temperature were correlated with differences in the degree of unsaturation of their extracted fats. The degree of unsaturation of the herring oil diet was very close to that of the fats of the goldfish prior to feeding and no change in the value for fish fed on this diet was observed. Each of the other two diets changed the degree of unsaturation of the goldfish fats by approximately 54% of the maximum theoretical change. These changes modified the heat resistance of the fish. The change in heat resistance resulting from the lard diet was equivalent to a change in acclimation temperature from 20 deg C to 24 deg C. The degree of modification of heat tolerance, however, cannot be strictly correlated with the degree of change of unsaturation of fats and it is concluded that factors associated with differences in melting point rather than melting point of the fat itself are probably involved in heat resistance. When the rates of death of the fish during the first 75 minutes at 36 deg C were compared, no statistical difference between the behavior of the samples fed the fish-oil diets existed, but the sample fed the solid diet (lard) was distinct. (Speakman-Vanderbilt)

W70-03723

GROWTH OF LARGEMOUTH BASS FRY AND VARIOUS TEMPERATURES,
Arkansas Univ., Fayetteville. Dept. of Zoology.
Kirk Strawn.
Transactions of the American Fisheries Society, Vol 90, No 3, p 334-335, July 1961. 1 fig, 2 ref.

Descriptors: *Temperature, *Growth rates, Fry, Fish eggs, Fish management, Productivity, Fish, Mortality, Fishkill.
Identifiers: *Largemouth bass.

Largemouth bass (Micropterus salmoides) eggs which had begun to hatch were taken from hatchery ponds and placed in aerated jars maintained at 15.0 deg, 17.5 deg, 20.0 deg, 22.5 deg, 25.0 deg, 27.5 deg, and 30.0 deg C. Fry were then removed from the tanks, beginning on the first day they started feeding. Samples of 10 fry from each temperature were preserved in 5 percent formalin. The growth rate of the fry at each temperature was determined by measuring total length in millimeters. Growth rate increased with increasing temperature, with the maximum occurring at 27.5 deg and 30.0 deg C. The 15.0 deg C fry did not feed and all died of starvation. (Speakman-Vanderbilt)

THERMAL DISCHARGE AND WATER QUALITY IN A 1,500-ACRE RESERVOIR,
Missouri Univ., Columbia. Dept. of Zoology; and Missouri Dept. of Conservation. Fisheries Div.
E. R. Brezina, Robert S. Campbell, and James R. Whitley.
Journal Water Pollution Control Federation, Vol 42, No 1, p 24-32, Jan 1970. 9 p, 2 fig, 4 tab, 26 ref.
OWRR Proj No B-001-MO.

Descriptors: *Thermal pollution, *Reservoirs, *Missouri, Thermal powerplants, Stratification, Thermal stratification, Water temperature, Ecology, Aquatic habitats, Turbidity, Dissolved oxygen, Water quality.
Identifiers: Montrose Reservoir (Mo).

This study reports on the effects of thermal discharges from a 525,000-kw fossil-fueled steam-electric plant into a 4.5 billion gal reservoir with a mean depth of 8.2 ft, in central Missouri. The most significant effect observed during the 21-month study was temperature elevation which averaged 5 deg to 8 deg C with a maximum difference in mean temperatures of 10 deg C. Differences in DO were always less than 1 mg/l. The area heated by the thermal discharge is influenced by the direction of the prevailing wind. The relatively shallow depth of the reservoir with the wind effects minimizes with thermal stratification and maintains suspension of fine particles. Runoff water maintains the high level of turbidity in the reservoir. There was no significant difference in living matter present in the heated and unheated areas of the reservoir. (Knapp-USGS)

RELATIVE TOXICITIES AND DISPERSING EVALUATIONS OF ELEVEN OIL DISPERSING PRODUCTS,
Washington State Water Pollution Control Commission, Olympia. Dept. of Fisheries.
Harry B. Tracy, Ronald A. Lee, Charles E. Woelke, and Gene Sanborn.
Journal Water Pollution Control Federation, Vol 4, No 12, p 2062-2069, Dec 1969. 1 fig, 4 tab, 4 ref.

Descriptors: *Biossay, *Dispersion, *Emulsifiers, *Toxicity, *Oil, Aquatic environment, Estuaries, Fish, Larvae.
Identifiers: *Pacific Northwest, *Dispersant, *Oil spills, Washington freshwater bioassays, Saltwater bioassays, In-situ bioassays, Group-number.

In a joint effort to provide information concerning oil dispersing products to organizations involved in oil spill control in the Pacific Northwest, the State of Washington conducted bioassays and evaluation experiments on eleven selected, commercial, U.S. oil dispersants. The test organisms for the toxicity were: steelhead fingerling, Pacific oyster larvae, and coho salmon fingerling dispersing evaluations were made visually. Each dispersant was scored on each test and from these scores, group assignments were made. Dispersant selections were determined from a group-number combination method. Thus, a score of one was given for a comparatively high dispersing property and a relatively low toxicity on the bioassays; a score of four was awarded for the converse of the foregoing factors. That is, dispersants bearing low group-number combinations provided least threat to the aquatic environment and more efficient dispersion. Selection of dispersant depends on size and location of spill. (D'Arezzo-Texas)

A METHOD FOR PREDICTING THE EFFECTS OF LIGHT INTENSITY ON ALGAL GROWTH AND PHOSPHOROUS ASSIMILATION,
Abbott Labs., North Chicago, Ill. Dept. of Sanitary Engineering; and Michigan Univ., Ann Arbor.
H. S. Azad, and J. A. Borchardt.
Journal Water Pollution Control Federation, Vol 41, No 11, Part 2, p R392-R404, Nov 1969. 10 fig, 14 ref.

Descriptors: *Algae, *Chlorella, *Scenedesmus, *Light, Phosphorus, Photosynthesis, Light intensity, Stabilization, Ponds, Penetration, Absorption.
Identifiers: *Beer-Lambert Law, *Fixed-density studies, *Fixed-light tests, *Effective-average-light-intensity, Photo-electric turbidostat, Light extinction coefficient, Algal cell density.

Research is devoted to obtaining a better understanding of the interaction of light intensity on the rate of algal growth, and phosphorous uptake by algae in an aqueous environment. Green Algae Chlorella and Scenedesmus were grown under a carefully controlled environment. The light intensity was varied by two methods: (1) maintenance of a constant biomass density by using a photo-electric-turbidostat apparatus providing for variable light intensity control at the sources; (2) maintenance of the incident luminous energy at a constant value providing for variable algae cell density. The Beer-Lambert expression (I sub 0/I = e to the power CAD) failed to predict the light penetration data. However, an empirical relationship in which the familiar coefficient of extinction was replaced by an exponential variable did provide the necessary agreement. Algal growth rate vs. the culture-face-light intensity yields a curve that implies the existence of a light saturation point. When growth rate vs effective average light intensity was plotted, a more logical effect of light was produced. (D-'Arezzo-Texas)

PHYTOPLANKTON NUTRIENT ENRICHMENT EXPERIMENTS OFF BAJA CALIFORNIA AND IN THE EASTERN EQUATORIAL PACIFIC OCEAN,
Scripps Institution of Oceanography, La Jolla, Calif.
William H. Thomas.
Journal Fisheries Research Board of Canada, Vol 26, No 5, p 1133-1145, 1969. 2 fig, 7 tab, 19 ref.

Descriptors: *Phytoplankton, *Inorganic compounds, Nitrogen, Phosphates, Aquatic life, Vitamins, Ocean currents, Nutrient requirements, Nutrients.
Identifiers: EDTA, Carbon-14, Baja California, Eastern Equatorial Pacific Ocean, Oceans, Coastal upwelling, EASTROPAC expeditions.

Results are reported of ten enrichment experiments carried out with natural illumination and prolonged incubation in the eastern equatorial Pacific Ocean. Carbon-14 uptake or changes in chlorophyll were used to assess the effects of enrichment in all experiments. The first five, between June 1964 and November 1966, indicated the most important limiting nutrient in oligotrophic water was nitrogen. Experiments were again carried out during January-March 1967, as the initial part of Expedition EASTROPAC, when areas of nutrient-rich waters were also sampled. These nutrient-rich waters were caused by seasonal upwelling (such as off Baja California), nonseasonal upwelling (the Costa Rica Dome), and of upwelling plus advection from the Peru Current (the nutrient-rich equatorial area). Tests of nutrient-poor waters confirmed that the primary nutrient limiting the population was nitrogen. In nutrient-rich water from equatorial upwelling, limitation by any specific nutrient were not found. Single additions of trace metals and vitamins stimulated chlorophyll synthesis; however, marked changes suggest that the populations in nutrient-rich waters were not nutrient limited. EXCRETION OF DISSOLVED ORGANIC COMPOUNDS BY AQUATIC MACROPHYTES,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
Robert G. Wetzel.
BioScience, Vol 19, No 6, p 539-540, 1969. 2 tab, 13 ref.

Descriptors: *Aquatic microorganisms, Carbon assimilation, Lakes, Photosynthesis, Organic compounds, Marl, Lakes.
Identifiers: *Najas flexilis, Carbon-14, Ionization, Chamber-electrometer, Photosynthetic carbon fixation, Aquatic macrophytes.

Interactions of inorganic parameters on rates of photosynthesis and excretion of total dissolved organic compounds (TDOC) by submerged angiosperm typical of marl lakes were studied. Photosynthetic rates were determined by uptake of carbon-14 labeled bicarbonate as determined by combustion to radiocarbon dioxide-14 and analysis in the gas phase. Mean rates of photosynthetic carbon fixation by Najas flexilis and rate of percentage of DOC excreted to the mean photosynthetic rate in response to increasing concentration of calcium, magnesium, sodium, and potassium are calculated. Photosynthetic rates consistently increased with increasing concentrations of calcium ions in the range 0.20 milligram/liter, but exhibited marked decrease at higher concentrations. DOC synthesized demonstrated a progressive reduction in relation to photosynthetic fixation. Photosynthetic rates were markedly reduced by increasing concentration of magnesium ions to and above those normally formed in typical marl lakes. DOC excretion was high in the range of 0-4 milligram/liter magnesium ions and particularly at concentrations above 15 milligram/liter. High rates of DOC loss prevailed in absence of sodium ions; rates decreased significantly at low levels of 1-3 milligram/liter, but increased markedly with higher concentrations of sodium ions. This pattern closely paralleled the photosynthetic rates. (Haskins-Wisconsin)

DISTRIBUTION, CHARACTERIZATION, AND NUTRITION OF MARINE MICROORGANISMS FROM THE ALGAE POLYSIPHONIA LANOSA AND ASCOPHYLLUM NODOSUM,
McGill Univ., Montreal (Quebec). Dept. of Microbiology and Immunology; and New Brunswick Univ., Fredericton. Dept. of Biology.
E. C. S. Chan, and Elizabeth A. McManus.
Canadian Journal of Microbiology, Vol 15, No 5, p 409-420, 1969. 5 fig, 4 tab, 38 ref.

Descriptors: *Marine microorganisms, *Algae, *Nutrient requirements, *Distribution, Bacteria, Sampling, Sea water, Seasonal, Pseudomonas,

Temperature, Amino acids, Intertidal areas, Carbohydrates, Yeasts, Enzymes, Cultures, Hydrogen sulfide, Electron microscopy, Biochemistry, Vitamins, Epiphytology.
Identifiers: *Polysiphonia lanosa, *Ascophyllum nodosum, Vibrio, Flavobacter, Escherichia, Sarcina, Staphylococcus, Achromobacter (Alkaligenes), Rhodotorula, Growth factors, Colonial morphology, Cellular morphology, Flagellation, Iodine test, Gram reaction, Cytophaga, Proteus, Serratia, Bay of Fundy (Canada), Rhyzoids.

Bacterial populations of two associated littoral marine algae, Polysiphonia lanosa and Ascophyllum nodosum, and their environmental seawater were studied quantitatively. Samplings showed numbers of bacteria on P lanosa and in the seawater remained relatively constant while those on A nodosum decreased in mid-summer, after an apparent spring maximum, and then gradually increased. Pure cultures of 25 isolates were studied and identified to genus level. There was a preponderance of the genera Vibrio and Flavobacter (8 each). Three of the Escherichia group, 2 of Pseudomonas, one each of genera Sarcina, Staphylococcus, and Achromobacter (or Alkaligenes), and a pink yeast (Rhodotorula) made up the other isolates. Optimum temperature for growth of most isolates was around 21C. Five isolates failed to grow at 30C; 20 did not grow at 37C; of the 5 growing at 37C, development was feeble in every case but one. Studies on gross nutritional requirements of the marine organisms showed that 22 of 25 isolates required a supplement of amino acids in growth medium. Two were able to grow on basal medium; one isolate grew only in a medium supplemented with growth factors in addition to amino acids (Jones-Wisconsin)

AVAILABILITY OF MUD PHOSPHATES FOR THE GROWTH OF ALGAE,
H. L. Golterman, C. C. Bakels, and J. J. Jakobs-Mogelin.
Verhandlungen der Internationalen Vereinigung fur theoretische und angewandte Limnologie, Vol 17, p 467-479, 1969. 10 fig, 3 tab, 10 ref, discussion.

Descriptors: *Eutrophication, *Mud (Lake), *Phosphorus, *Aquatic algae, *Bioassay, Scenedesmus, Phosphates, Water pollution sources.
Identifiers: *Dutch lakes, *Allochthonous phosphates, Ultra-violet light sterilization, Asterionella, Scenedesmus obliquus, Growth constats, River Rhine.

Avilability of lake muds phosphorus to algae was determined by employing Scenedesmus obliquus as test organism. Culture solutions contained potassium phosphate in different concentrations, calcium phosphates, iron phosphates, and lake muds as the only source of phosphorus. The growth constants were obtained from cultures with inorganic phosphates. Based on the number of cells of Scenedesmus, a considerable fraction of mud phosphorus was available to algae. Depending on the origin of sediment, from 7 to 30.5% of phosphorus was used for cell growth. Sterilization with ultra-violet light had no significant influence on the growth of organisms. Results suggested that Scenedesmus is utilizing largely allochthonous phosphates, leaving sufficient supply of inorganic phosphorus for Asterionella algae. (Wilde-Wisconsin)

RELATION BETWEEN FILTERING RATE, TEMPERATURE, AND BODY SIZE IN FOUR SPECIES OF DAPHNIA,
Yale Univ., New Haven, Conn. Osborn Memorial Labs.
Carolyn W. Burns.
Limnology and Oceanography, Vol 14, No 5, p 693-700, 1969. 2 fig, 2 tab, 18 ref, discussion.

Descriptors: *Grazing, *Temperature, *Daphnia, Physiological ecology, Lakes, Environmental effects, Water pollution effects, Epilimnion, Connecticut, Euglena, Chlamydomonas, Phosphorus radioisotopes, Regression analysis, Algae, Ponds, Predation.
Identifiers: *Filtering rate, *Body size, *Comparative studies, Daphnia schodleri, Daphnia pulex, Daphnia galeata mendotae, Daphnia magna, Selenastrum, Rhodotorula, Temperature coefficients, North America, Central America, Rate equations, Analysis of variance, Food concentration, Mexico, Predictive equations, Zoogeography, Thermobiology.

Filtering rates (F) of cladocerans can be measured by determining their uptake of radiophosphorus from labelled food. F of four daphnid species, fed on labelled yeast, were measured at temperatures of 15C, 20C, and 25C. Maximum F increased with rising temperature and body size in all species, but a general equation relating F to body length (L) could not be derived. Body weight (W) can be deduced from L with equations of type, $\log W = \log a + b \log L$, where a and b are empirically derived coefficients. Data are tabulated for a and b of all species, considered collectively and individually. F, expressed in milliliters water filtered per hour/milligram daphnid dry weight, differed among species. F for adult Daphnia schodleri (DS) and Daphnia pulex (DP) were similar, and at 20C, were slightly higher than at 15C or 25C. F for Daphnia magna (DM) and Daphnia galeata mendotae (DG) increased with increasing temperature. Temperature coefficients (Q-10) for F, changing in range 15-25C were, for four species: DG-2.71, DM-2.38, DP-0.94, DS-0.90. Thermal determinants of maximum F may determine success of daphnids occupying warm epilimnetic lacustrine waters in summer. (Eichhorn-Wisconsin)

UPTAKE OF GLYCINE BY BLUE-GREEN ALGAE,
California Univ., Irvine. Dept. of Organismic Biology; and Gujarat Univ., Ahmadabad (India). Botany Div.
G. C. Stephens, B. S. Vaidya, and O. P. Saxena.
Indian Journal of Experimental Biology, Vol 7, No 1, p 43-44, 1969. 1 fig, 3 ref.

Descriptors: *Cyanophyta, *Amino acids, Carbon radioisotopes, Radioactivity, Carbon dioxide, Chlorophyta, Absorption, Chromatography, Metabolism.
Identifiers: *Uptake, *Glycine, Oscillatoria jasorvensis, Gloeotrichia pisum, Microcystis aeruginosa, Spirogyra, Assimilation, Autoradiography, Heterotrophy.

Uptake of glycine-carbon-14 was measured in three species of blue-green algae: Oscillatoria jasorvensis, Gloeotrichia pisum, and Microcystis aeruginosa. Radioactivity in breis of Oscillatoria increased with increasing incubation time in glycine-carbon-14 solution (100 microns carbon/liter distilled water). Uptake rate increased with the increasing ambient glycine-carbon-14 concentration, maximum velocity of uptake being 0.0000004 moles/gram tissue per hour. Radio-activity lost from the medium is measured quantitatively as radioactive carbon dioxide and as much as 15% of radioactivity is lost from glycine-carbon-14 at 0.0000009 moles/liter. Most experiments were conducted with Oscillatoria, the easiest organism to use. Results indicate positive absorption and assimilation of glycine by blue-green algae compared to negative results with green alga, Spirogyra. Blue-green algae investigated are capable of obtaining and utilizing glycine from dilute solution; the glycine obtained can enter oxidative pathways as indicated by carbon dioxide production or may act as a substrate for synthesis. The potential significance of this capacity of heterotrophy depends on the level of free amino acids in the environment. (Jones-Wisconsin)

Descriptors: *Bacteria, *Phosphorus, *Phosphates, *Cultures, Soil bacteria, Oats, Corn (Field), Organic acids, Fertilizers, Pseudomonas.
Identifiers: Peas, Sugars, Phosphate-dissolving, Pseudomonas fluorescens, Organic excretions.

Experiments were conducted concerning effect of phosphate-dissolving bacteria and a soil bacteria mixture on availability of phosphorus in minerals to peas and oats. Greenhouse trials with sterilized and inoculated media and test plants whose root systems had different capacity for dissolving phosphates indicated monoculture of Pseudomonas fluorescens exerted a positive influence on peas and oats growth, increasing utilization of phosphate mineral. Pea plants inoculated with soil suspension grew less than control plants. Total phosphorus content was higher in bacterized cultures. Apparently reduced growth of inoculated plants was caused by bacteria-produced toxic substances disrupting normal plant development. Bacteria influence on solubility of phosphate minerals was determined from composition of organic excretions of roots. Peas and oats, during initial growth stages, excreted equal amounts of organic substances; corn, also investigated, excreted more. Root excretions of corn were largely sugars and small amounts of amino-nitrogen. Oats gave the maximum content of amino-nitrogen in dry matter. Pea root excretions contain acidic substances, were free from sugars, and had relatively small amounts of amino-nitrogen. Microorganisms utilized all detected sugars as the only source of carbon in the medium, followed by formation of acids. (Jones-Wisconsin)

A DISCUSSION OF NATURAL AND ABNORMAL DIATOM COMMUNITIES,
Academy of Natural Sciences, Philadelphia, Pa. Dept. of Limnology.
Ruth Patrick.
Algae and Man, Jackson, Daniel F, (editor), Plenum Press, New York, p 185-204, 1964. 6 fig, 2 tab, 46 ref.

Descriptors: *Biological communities, *Diatoms, *Water pollution effects, Streams, Rivers, Environmental effects, Biomass, Bioindicators, Physiological ecology, Temperature, Salinity, Nutrients, Dystrophy, Acidic water, Humic acids, Chrysophyta, Oligotrophy, Eutrophication, Pennsylvania, Estuaries, Maryland, Hydrogen ion concentration, New Jersey, South Carolina, Industrial wastes, Texas.
Identifiers: *Community structure, Species composition, Eunotia, Savannah River, McMichael Creek (Pennsylvania), Middle River (Maryland), Ridley Creek (Pennsylvania), Egg Harbor River (New Jersey), Fragilaria, Achnanthes, Navicula, Nitschia, Synedra, Wateree River (SC), Gomphonema, Melosira, Cymbella, Neches River (Texas), Navicula, Bacillaria, Mesotrophy.

Diatom associations have been used variously as bioindicators of natural water quality conditions or of degree of disturbance due to pollution. Because we know little regarding physiological requirements and tolerance to pollution of particular species of diatoms, it is difficult to assess whether variations in species abundance and composition are due to normal environmental variation or to specific effects of pollutants. Changes in community structure, as indicated by changes of numbers of species or changes in percentage of composition of diatom communities attributable to dominant species, may be more reliable criteria of general pollutional conditions in flowing water. These principles are illustrated with data from a variety of streams and rivers of differing trophic or pollutional status. It can be shown, for example, that parameters of community structure for a dystrophic stream and for a badly polluted one are similar. In some cases, it is possible to find specific diatoms which are indicators of pollutional conditions duplicating natural conditions occurring during geological time. (See Vol 2, No 19, Field 5C, W69-07832). (Eichhorn-Wisconsin)

THE RESPONSE OF NATURAL MICROBIAL POPULATIONS IN SEAWATER TO ORGANIC ENRICHMENT,
Woods Hole Oceanographic Institution, Mass.
Ralph F. Vaccaro.
Limnology and Oceanography, Vol 14, No 5, p 726-735, Sept 1969. 6 fig, 10 ref.

Descriptors: *Water pollution effects, *Eutrophication, *Seawater, *Marine microorganisms, *Organic matter, *Microbial populations, Carbon radioisotopes, Kinetics, Atlantic Ocean, Amino acids, Carbohydrates, Organic acids, Aquatic populations, Massachusetts, Plankton, Estuaries, Microbiology, Physiological ecology.
Identifiers: *Enrichment, *Microbial populations, Heterotrophy, Heterotrophic potential technique, Michaelis-Menten equation, Lineweaver-Burk equation, Sargasso Sea, Glycine, Glucose, Phenylacetic acid, Malic acid, Woods Hole (Mass), Microplankton, Heterogeneous populations, Sodium lactate, Assimilation, Substrate affinity, Turnover times.

The heterotrophic potential technique (HTP) is based on kinetic behavior of enzymes, described by Michaelis-Menten equation. Aquatic microbial populations are incubated for short periods in presence of radiocarbon-labeled substrates (carbohydrates, amino and organic acids) and radiocarbon uptake determined. If plot of uptake velocity versus substrate concentration yields a hyperbolic curve, this can be converted to linear form (Lineweaver-Burk plot) whose intercept and reciprocal slope estimate, respectively, maximum time for complete removal of substrate, and maximum uptake rate. Applied to marine and other populations, uptake responses often fail to develop or resultant patterns are uninterpretable. When enrichment period is extended to 24 hours or more, such difficulties may be overcome. This shift in behavior provides a desirable source of cells for bioassays, and means for studying dynamics of heterotrophy. Trophic significance of organic matter in seawater might be studied by identification of specific compounds, but the complexity of this approach suggests that HTP might provide an effective alternative. Regional studies show no single kinetic pattern characterizing uptake by marine microplankton, and that heterotrophs are apparently inactive to some supposedly labile compounds, which phenomena may indicate a need for more rigid definition of 'availability' of organic compounds. (Eichhorn-Wisconsin)
W70-03967

BACTERIAL GROWTH RATE IN THE SEA: DIRECT ANALYSIS BY THYMIDINE AUTORADIOGRAPHY,
Indiana Univ., Indianapolis. Dept. of Microbiology.
Thomas D. Brock.
Science, Vol 155, No 3758, p 81-83, Jan 1967. 1 tab, 8 ref.

Descriptors: *Bacteria, *Growth rates, *Marine microorganisms, *Analytical techniques, Tritium, Rhodophyta, Connecticut, Rhode Island.
Identifiers: *Autoradiography, *Thymidine, Epiphytes, Leucothrix mucor, Pure cultures, Heterogeneous cultures, Antithamnion sarniense, Iceland, Long Island Sound (Conn), Microbial ecology, Non-parametric statistics, Narragansett Bay (RI), Cape Reykjanes (Iceland), Sudurnes (Iceland), Italy, Bay of Naples, Scotland, Loch Ewe (Scotland).

Estimating cellular growth rates with tritiated thymidine (TT) assumes that: desoxyribonucleic acid (DNA) is synthesized only by dividing cells; TT is incorporated into acid-insoluble cellular fraction only during DNA synthesis; cellular TT incorporation is detectable autoradiographically. TT incorporation rates in Leucothrix mucor, a marine filamentous epiphyte with recognizable morphology, was estimated in pure cultures by incubating with TT in seawater medium and preparing autoradiograms after different incubation periods. Radioactive cells were scored from autoradiograms. Comparison of incorporation rates with generation times yields relationship that 1% cells become radioactive after 0.002 generation. If following assumptions hold, that relationship can be used to estimate generation times in natural populations: relationship between TT uptake and generation time is constant within species; rate of TT uptake is linear and without lag; dilution of TT uptake is linear and without lag; dilution of TT with naturally occurring nonradioactive thymidine is negligible. Generation time (in minutes), so determined, for natural populations of Leucothrix from two sites were: Iceland 685, Long Island Sound 660. In combined pure culture with red alga, Antithamnion sarniense, in medium not normally supporting growth of Leucothrix alone, its generation time was 94. Described technique should be adaptable to organisms incorporating TT; available in pure culture; microscopically recognizable in nature. (Eichhorn-Wisconsin)

REPORT OF AN ALGAL BLOOM IN VIETNAM,
Hungarian Univ. of Agricultural Sciences, Godollo (Hungary). Inst. of Botany and Plant Physiology.
T. Hortobagyi.
Acta Biologica Academiae Scientiarum Hungaricae, Vol 20, No 1, p 23-34, 1969. 5 fig, 23 ref.

Descriptors: *Algae, Temperature, Cyanophyta, Chlorophyta, Scenedesmus, Benthos, Convection, Waves (Water), Fish, Sewage, Euglenophyta, Diatoms, Biological communities, Backwater, Ponds, Alaska.
Identifiers: *Bloom, *Vietnam, Little Lake (Hanoi), Red River (Vietnam), Chlorococcus, Spines, Schizomycophyta, Caulobacteriales, Chlorococcales, Conjugatophycaea, Planctomyces, Bacillariophyta, Gloecapsa, Merismopedia, Microcystis, Ankistrodesmus, Pediastrum, Tetraedron, Tetrastrum, Tisza (Hungary), Zimona (Hungary), Algal taxonomy, Spirulina, Chodatella, Miracantha, Buzsak (Hungary), Jamuna (India), Hormogonales, Aphanocapsa, Coelosphaerium, Chloronostoc, Pelodictyon, Synechocystis, Anabaena, Lyngbya, Oscillatoria, Romeria, Astasia, Schroederia, Coelastrum, Dictyosphaerium, Gloeoactinum, Golenkinia, Nephrochlamys, Nephrocytium, Oocystis, Siderocelis, Staurastrum.

An algal bloom of vivid green color developed in Little Lake, Hanoi (water temperature 13-26C). The lake, an isolated backwater of the Red River, contains contaminated water. The bloom was rich in species and new taxons with Cyanophyta and Chlorophyta from both surface and bottom dominating. Scenedesmus variability was prominent. A sample indicated 115 species without Bacillariophyceae. The number of the Scenedesmus species was larger than in the bloom. Cyanophyta dominated with 82% in the algal bloom and 92% in the bottom sample; Chlorophyta with 12% and 6.8%, respectively. No definite line of demarcation exists between the two biotopes because the algal bloom developed above the bottom and bottom plants are easily raised near the surface by waves, convectional streaming and fish movement. The algae of the two biotopes are different, the phytobiocoenoses being dissimilar. Number of common taxons is 51% of the total; undescribed taxons is 33%. Parallel morphoses are well represented by some Scenedesmus species. Among spiny forms of the Chlorococcales, those of thin spines are less frequent. Protuberances become more developed in Hanoi and toward the tropics. (Jones-Wisconsin)

STUDIES ON THE RESISTANCE OF MARINE BOTTOM INVERTEBRATES TO OXYGEN-DEFICIENCY AND HYDROGEN SULFIDE,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
H. Theede, A. Ponat, K. Hiroki, and C. Schliefer.
Marine Biology, Vol 2, No 4, p 325-337, 1969. 6 fig, 5 tab, 67 ref.

Descriptors: *Invertegrates, *Oxygen requirements, *Gastropods, Temperature, Crustaceans, Oxygen, Hydrogen sulfide, Inhibitors, Benthic fauna, Oceans, Metabolism.
Identifiers: Lamellibranchs, Polychaetes, Echinoderms, North Sea, Baltic Sea, Kattegat, Cyprina, Scrobicularia, Mya, Nereis, Asterias, Ophiura, Carcinus, Gammarus, Idotea, Crangon, Mytilus, Cardium, Littorina littorea, Littorina saxatilis.

Resistance to oxygen deficiency and presence of hydrogen sulfide of bottom invertebrates from various biotopes of the North and Baltic Seas was investigated under laboratory conditions. Resistance of animals to adverse conditions was greater in species inhabiting soft bottoms than in those inhabiting hard or sandy substrata. The duration of ciliary movement was longer at lower temperatures. Excised tissues of boreal marine species also extended their activity for a longer period at a low temperature. Isolated gills of Mytilus edulis showed a higher resistance to sulfide ions and hydrogen sulfide at pH 7 than at pH 8. The cellular resistance of euryhaline species to oxygen deficiency and hydrogen sulfide presence declined very slightly with decreasing salinity. (Wilde-Wisconsin)

ALGAE, MAN, AND THE ENVIRONMENT.

Proceedings of an International Symposium held at Syracuse University, June 18-30, 1967. Daniel F Jackson, Editor. New York, Syracuse Univ Press, 1968. 554 p.

Descriptors: *Algae, *Environmental effects, *Human population, *Eutrophication, *Conferences, Nuisance algae, Publications, Water pollution effects, New York, Chlorophyta, Nutrients, Ecosystems, Phytoplankton, Photosynthesis, Cyanophyta, Cytological studies, Electron microscopy, Waste treatment, Lakes, Water quality, Viruses, Algicides, Fish, Streams, Productivity.
Identifiers: *Phycology, NY State Science and Technology Found, Syracuse (NY), Syracuse University, Fundamental studies, Applied studies, Algal physiology, Algal biochemistry, Algal taxonomy, Algal phylogeny, Cladophora, Algal genetics, Russia, Bavaria, Moriches Bay (NY), Onondaga Lake (NY).

Phycological studies are important not only because of nuisance effects of algae for man, but also for their potential benefits. To compile information on basic and applied phycology, a symposium--which this volume records--was sponsored by New York State Science and Technology Foundation and Syracuse University, New York (18-30 June 1967). Volume is organized into three sections: fundamental phycology, applied phycology, and algal studies in New York State. The following topical list of 27 papers by 32 contributors indicates its scope: historical phycology (1927-1967); taxonomy and phylogeny in algal biochemistry and physiology; algal requirements for micronutrients; phosphate metabolism of green algae; nitrogen input to aquatic ecosystems; light and temperature effects on algae; phytoplanktonic photosynthesis; photosynthesis of Cladophora; biology of filamentous conjugating algae; approach to modern algal taxonomy; trends in algal genetics; cytology of cyanophytes (blue-green algae); ultrastructure of cyanophytes; Russian experiments in algal culture; phycological medicine; Russian soil algology; harvesting waste-grown microalgae; wastewater treatment and algal growth; regeneration of Bavarian lakes; nutrient removal, viral diseases in cyanophytes; algicidal effects; algae-fish relationships; stream assimilation (New York); productivity, Moriches Bay (New York); algal environment, Onondaga Lake (New York); review of algal literature (New York State). An index is provided. (See W70-03974). (Eichhorn-Wisconsin)

ONONDAGA LAKE, NEW YORK--AN UNUSUAL ALGAL ENVIRONMENT,
Syracuse Univ., N. Y. Dept. of Civil Engineering.
Daniel F. Jackson.
Algae, Man, and the Environment, Syracuse Univ Press, New York, p 515-524, 1968.

Descriptors: *Algae, *Aquatic environments, *Eutrophication, *Meromixis, *Water pollution effects, Bioindicators, Nuisance algae, New York, Sewage effluents, Sewage treatment, Industrial wastes, Water chemistry, Diatoms, Chlorophyta, Euglenophyta, Cyanophyta, Chrysophyta, Bioassays, Saline water, Chlorella, Chlamydomonas, Euglena.
Identifiers: *Onondaga Lake (NY), Eunotia, Amphora, Gomphonema, Pinnularia, Nitzschia, Navicula, Syracuse (NY), Enteromorpha intestinalis, Cladophora, Cyclotella, Halochlorococcum, Synechococcus, Carteria, Gonium, Ankistrodesmus, Microspora, Pediastrum, Scenedesmus, Lepocinclis, Anabaena, Anacystis, Gloeotrichia, Gloeocapsa, Stauroneis.

Fed by saline springs, Lake Onondaga has highest known chloride content (typically 1460 milligrams/liter) of New York lakes and is probably meromictic. Its morphometric, geographic and historical features are described, and water quality data are tabulated to include comparisons with other lakes. Although subject to extensive eutrophication since 1863, it fails to bloom with planktonic cyanophytes, but annual blooms of chlorophytes and euglenophytes have occurred during summers since 1962. Lake receives industrial pollutants. Two characteristic areas are observable, based on distribution of attached algae, Cladophora and Enteremorpha; variations in the ionic ratio, sodium/calcium, are thought to control their distribution. Lake supports abundant growth of diatoms, distributed among 28 genera. In a study to evaluate effects on the lake of replacing primary treatment plants with improved secondary treatment, growth of ten strains of chlorophytes, two euglenophytes, eight diatoms, and five cyanophytes cultured in four concentrations of enriched lake water was compared with their growth in nutrient media. Bioassay data are tabulated; summarized, they indicate that lake's water will not support growth of planktonic cyanophytes, and that some component stimulates growth of diatom, Cyclotella, and the chlorophytes: Chlamydomonas, Halochlorococcus, and Chlorella (Milford strain). (See also W70-03973). (Eichhorn-Wisconsin)

EUTROPHICATION: CAUSES, CONSEQUENCES, CORRECTIVES.
National Academy of Sciences, Washington, D.C.

Proceedings of symposium held June 11-15, 1967, Wisconsin Univ, Madison. Gerard A Rohlich, Chairman, Planning Committee for the International Symposium on Eutrophication. NAS Standard Book No 309-01700-9. Printing and Publishing Office, National Academy of Sciences, Washington, DC, 1969. 661 p.

Descriptors: *Eutrophication, *Water pollution sources, *Water pollution effects, *Water pollution control, *Conferences, Streams, Estuaries, Lakes, Great Lakes, Physiological ecology, Water chemistry, Geographical regions, Cycling nutrients, Zooplankton, Algae, Aquatic plants, Paleolimnology, Mathematical models, Bacteria, Phytoplankton, Geochemistry, Benthos, Fish, Ecosystems.
Identifiers: National Academy of Sciences (USA), University of Wisconsin, Asia, National Research Council (USA), US Atomic Energy Commission, National Science Foundation, Office of Naval Research, US Department of Interior, Madison (Wis), Europe, Water pollution assessment, Urban drainage, Agricultural drainage, North America, Forest drainage.

In 1965, a planning committee appointed by National Academy of Sciences-National Research Council (NAS-NRC) recommended that '--an international symposium on eutrophication be held in order that the present worldwide state of knowledge and understanding of this phenomenon can be discussed in open forum and recommendations developed for the effective management of problems and for the course of future research.' That symposium met at University of Wisconsin, Madison, 11-15 June 1967, sponsored by NAS-NRC, Atomic Energy Commission, Department of Interior, National Science Foundation, and Office of Naval Research. Approximately 600 persons from 12 countries attended. This report of proceedings includes an introductory address, 'Eutrophication, Past and Present', by Yale University Professor G. E. Hutchinson, and four sections of technical presentations as follows (numbers of contributions to each indicated in parentheses): geographical concepts (9); detection and measurement (7); prevention and correction (8); scientific contributions from eutrophication research (8). Two papers, presented at conference, are not published here. The report also includes an introduction, summary, and series of specific recommendations formulated by the organizing committee: 12 relating to education and information and 8 to research. The committee also recommended that NAS-NRC form a permanent committee to implement its recommendations. (See also W70-03976 and W70-03977). (Eichhorn-Wisconsin)

SOME POSSIBLE PHYSIOLOGICAL STRESSES INDUCED BY EUTROPHICATION,
Toronto Univ. (Ontario).
F. E. J. Fry.
Eutrophication: Causes, Consequences, Correctives. Proceedings of a Symposium, National Academy of Sciences, Washington, DC, p531-536, 1969. 4 fig, 13 ref.

Descriptors: *Eutrophication, *Physiological ecology, Water pollution effects, Dissolved oxygen, Fish, Lakes, Hypolimnion, Brook trout, Carbon dioxide, Rainbow trout, Anaerobic conditions, Toxicity, Respiration, Temperature, Environmental effects, Phytoplankton, Metabolism, Bass, Cisco.
Identifiers: *Physiological stresses, Phototrophic zone, Carassius carassius, Rasbora daniconius, Oxykinetic responses, Coregonus artedi, Lake Nipissing (Ontario), Ontario, Canada, Osmoregulation, Micropterus salmoides, Algal blooms, Mechanical effects, Salvelinus fontinalis.

Physiological stresses on organisms induced by eutrophication are little understood. Oxygen reduction in eutrophic waters is probably the most pressing stress on fishes. Two types of fluctuations take place: long-term, occurring in hypolimnetic waters and under ice-cover; and short-term, in phototrophic zones due to variations in illumination. Interactions of carbon dioxide, temperature, and ambient oxygen in influencing physiology of a highly aerobic fish are illustrated with data for brook trout. Rainbow trout respond to lowered ambient dissolved oxygen with increased locomotory activity and increased ventilation, responses which may expose fish to futher stresses. Oxykinetic responses of fishes may move them to regions where dother conditions are unfavorable, and increased ventilation tends to increase uptake of toxic substance via gills. Increased irrigation of gills tends also to increase metabolic cost of osmoregulation, which may amount to about 20% of metabolic rate of rainbow trout in hard waters. Under eutrophic conditions, where oxygen concentrations vary widely during a day, fish are probably not as unstressed as the mean concentration may suggest, even though daily minimum is above lethal level. PHYSIOLOGICAL ECOLOGY,
Oregon State Univ., Corvallis. Dept. of Botany.
Harry K. Phinney.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 141-145. 1 fig, 5 ref.

Descriptors: *Physiological ecology, *Aquatic environments, Rivers, Environmental effects, Periphyton, Water pollution effects, Oregon, Bioindicators, Light intensity, Eutrophication, Grazing, Algae, Water chemistry, Biomass, Benthos, Salinity, Snails, Sulfates, Nitrates, Phosphates, Potassium, Iron, Bicarbonate, Zinc, Cobalt, Calcium, Magnesium, Currents (Water).
Identifiers: Berry Creek (Ore), Oregon State University, Experimental streams, Seasonal effects, Thermal effects, Aphanizomenon flos aquae, Metolius River (Ore), Community structure, Oxytrema, Organic enrichment, Interactions.

Physiological ecology may be defined as the study of physiological responses of organisms to variations in ecological conditions experienced in nature or to those which can be manipulated in the laboratory. Both laboratory and field approaches to ecology suffer from basic philosophical and methodological defects. Physiological ecologists attempt to retain a balanced perspective, and maintain an awareness of these pitfalls in interpreting data and constructing generalizations. Specific studies are cited which illustrate these principles for a variety of aquatic environments (rivers, laboratory

streams, and estuaries) and for a variety of influencing factors (chemical, physical, and biotic). Because of complexities in elucidating causal factors influencing species abundance, great caution should be exerted in identifying algal species as indicators of pollution. Accumulation of information relative to physiological ecology is slow, laborious, and fraught with difficulties hampering correct interpretation. It is unlikely that 'crash' programs designed to characterize the physiological ecology of cultural eutrophication can provide solutions to our present crisis in time to prevent the foreseeable disaster. (See Vol 3, No 7, Field 5C, entry W70-02775). (Eichhorn-Wisconsin)
W70-03978

PRODUCTIVITY OF RIVERS,
Montana State Univ., Bozeman. Center for Environmental Studies.
John C. Wright.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore. Pac Northwest Water Lab, p 186-206. 8 fig, 6 tab, 24 ref.

Descriptors: *Productivity, *Rivers, Carbon dioxide, Photosynthesis, Aquatic plants, Alkalinity, Bicarbonates, Nitrogen cycle, Ammonia, Organic matter, Bacteria, Nutrients, Phosphates, Nitrates, Groundwater, Respiration, Sampling, Wyoming, Thermal water, Chemical analysis, Insects, Productivity, Diurnal, Standing crop, Light intensity, Plant growth, Solar radiation, Chara.
Identifiers: Firehole River (Wyo), Madison River (Wyo), Gibbon River (Wyo), Trichoptera, Ephemeroptera, Nez Perce Creek (Wyo), Carbon/nitrogen ratio, Diversity indices, Myriophyllum, Glyceria, Ranunculus, Fontinalis, Potamogeton, Nitella, Ruppia, Utricularia, Zannichellia, Carex, Hippuris, Scapania, Berula, Eleocharis, Junus, Rorippa, Hygrophypnum, Fissidens.

Enrichment of rivers by organic pollution with photosynthetically available carbon dioxide may be equally important as fertilization with other nutrients. Based on field studies, the conclusion is that maximal photosythetic rates are attained only in flowing water of high total alkalinity. Percentage of stream bottom covered by vegetation and diversity of communities multiply with total alkalinity increases. Regardless whether free carbon dioxide or bicarbonate were used as a carbon source, the rate of photosynthesis decreased when initial pH values above 8.0 occurred; presumably this si due to limitation of photosynthesis by decreasing concentrations of free carbon dioxide. Evidence is also presented suggesting that various species of aquatic macrophytes differ in their ability to utilize bicarbonate ion in contrast to free carbon dioxide. Also determined is that, on the average, 20% of photosynthetically-fixed carbon appears in soluble organic form; the nitrogen cycle appears involved, since soluble organic substances become more enriched with nitrogen during photsynthesis and a rise in ammonia concentrations also accurs during the photosynthetic period. Soluble organic compound, released during photosynthesis, may be important as food substrate for bacteria in flowing-water ecosystems. (See Vol 13, No 7, Field 5C, entry W70-02775). (Jones-Wisconsin)

C-14 UPTAKE AS A SENSITIVE MEASURE OF THE GROWTH OF ALGAL CULTURES,
California Univ., Davis. Dept. of Zoology; and California Univ., Davis. Inst. of Ecology.
Charles R. Goldman, Milton G. Tunzi, and Richard Armstrong.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 158-170. 6 fig, 1 tab, 11 ref.

Descriptors: *Carbon radioisotopes, *Algae, *Cultures, Phytoplankton, Carbon, Radioactivity, Chlorella, Sampling, Effluents, Tributaries, Alkalinity, Hydrogen ion concentration, Nutrients, Phosphorus, Nitrogen, Iron, Growth rates, Chlorophyta, Cyanophyta, Chrysophyta, Photosynthesis.
Identifiers: *Growth, *Uptake, Fixation, Cell count, Optical density, Particulate organic carbon, Lake Tahoe (Calif), Chlorella pyrenoidosa, Selenastrum gracile, Carbon assimilation, Bacillariophyceae, Dinophyceae.

Results of comparisons to determine reliability of carbon-14 experiments with other methods employed for measuring growth in cultures are summarized. These include making cell counts, measuring the increase in light extinction as the cells multiply, and determining the biomass of cells produced. Results of a Chlorella experiment provide a valuable evaluation of these methods. The cell count was quite successful; the optical density method was fastest and easiest but was mainly applicable to measuring concentration of dense cultures. The carbon-14 method can easily be used for measuring algal cell growth in both nutrient-rich and nutrient-poor waters. Carbon-14 can detect growth in water with natural phytoplankton when cell count and optical density methods do not give evidence of any change in algal mass; carbon-14 data give a carbon fixation rate, whereas cell count and optical density measurements are static measures of mass. In addition, carbon-14 experiments yield values proportional to the mass of cells in a culture. The combined effect of nitrogen and phosphorus was to stimulate photosynthesis, the greatest stimulation resulting from the maximal addition of the two nutrients. (See Vol 3, No 7, Field 5C, entry W70-02775). (Jones-Wisconsin)

5D. Waste Treatment Processes

EVAPORATIVE COOLING OF HEATED IRRIGATION WATER BY SPRINKLER APPLICATION,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
J. N. Cline, M. A. Wolf, and F. P. Hungate.
Water Resources Research, Vol 5, No 2, p 401-406, Apr 1969. 1 fig, 3 tab, 20 ref.

Descriptors: *Heated water, *Sprinkler irrigation, Temperature control, Cooling, Irrigation, Evaporation, Crop production.
Identifiers: *Impact temperature, Relative humidity, Nozzle pressure, Evaporative cooling.

Heated water was cooled rapidly to impact temperatures that produce optimum growth in plants by applying the water with a standard irrigation sprinkler. Maximum cooling was observed nearest the sprinkler, where the smallest droplets were measured, and temperatures and mean diameters generally increased with distance from the source. Impact temperatures of the water droplets approached but did not reach wet bulb temperatures. Water as hot as 50 deg C was cooled to droplet temperatures of 25 deg C or less when the sprinklers were operated in an associated arid climate and at line pressures greater than 25 psi. A theoretical treatment correlated well with one selected set of experimental data and with predicted cooling rates for specified droplets in several typical atmospheric conditions and one untypical condition for an arid climate. Only under the condition of high relative humidity at a given ambient temperature does it appear that cooling might be insufficient to produce usable sprinkler water from 50 deg C supply water for crop production. (Rietveld-Vanderbilt)

TEMPERATURE RELATIONSHIP IN AEROBIC TREATMENT AND DISPOSAL OF PULP AND PAPER WASTES,
National Council for Stream Improvement, Baltimore, Md.
William L. Carpenter, James G. Vamvakias, and Isaiah Gellman.
Journal Water Pollution Federation, No 40, p 733-740, May 1968. 3 fig, 6 tab, 12 ref.

Descriptors: *Temperature, *Lagoons, *Activated sludge, *Biochemical Oxygen Demand, Industrial wastes, Pulp and Paper Industry, Pulp wastes.
Identifiers: *Aerated Lagoons, Temperature coefficients, Deoxygenation rate, Temperature effect.

Tabulated and graphical results are given of studies on the effect of temperature on the performance of aerated lagoons and activated-sludge plants treating waste waters from pulp and paper mills and on the rate of de-oxygenation of such waste waters in streams. It was found that BOD removal in aerated lagoons is adversely affected by temperatures below 20 deg C, but this effect can be minimized by increasing the retention period to 10 days, when BOD removals of 79 per cent can be obtained at temperatures as low as 2 deg C. For activated-sludge treatment the optimal temperature was found to be 37 deg C, and there was a progressive deterioration in performance as the temperature was raised to 52 deg C. The de-oxygenation rate constant was the same for both crude and treated waste waters, and equalled 0.2 at 20 deg C. The temperature coefficients for de-oxygenation rate and rates of removal of BOD were estimated. (Rietveld-Vanderbilt)

COOLING WATER SOURCES FOR POWER GENERATION,
Westinghouse Electric Corp., East Pittsburgh, Pa.
L. G. Hauser.
ASCE National Water Resources Meeting, Memphis, Tennessee, Jan 26-30, 1970. 22 p, 9 fig, 7 tab.

Descriptors: *Cooling, *Thermal pollution, *Cooling towers, Thermal powerplants, Environmental engineering, Heat balance, Heated water, Optimization, Nuclear powerplants, Electricity, Electric power production, Electric power costs, Electric power demand, Economic prediction, Costs, Economics, Decision making, Project planning.

The forecast of future electricity production in the U.S.A. is projected; and the possibilities of cooling of the future released heat are discussed. The forecast is made up to the year 2000 and shows that residual heat dissipation will be a serious problem for future generating plants. The further main conclusions are: (1) The cost of alternate heat dissipation methods is not prohibitive and will not deter the growth in demand for electric power. (2) Approximately 70% of new base load generating stations will require supplemental cooling systems by 1980. (3) Cost penalties of supplemental cooling systems can be minimized with sophisticated analytical techniques. Optimization techniques for overall least cost of power production and cooling are illustrated. (Novotny-Vanderbilt)

MANAGEMENT OF INDUSTRIAL EFFLUENT DISPOSAL IN BRITAIN,
Distillers Co. Ltd., London (England). Dept. of Effluent and By-Products.
C. J. Jackson.
Journal Water Pollution Control Federation, Vol 41, No 12, p 2018-2025, Dec 1969. 8 p, 2 fig.

Descriptors: *Water management (Applied), *Waste disposal, *Industrial wastes, Water conservation, Waste treatment, Waste water treatment, Management, Water law.
Identifiers: *Great Britain, Waste disposal management.

The relationships between governmental agencies and industrial plants in Britain are outlined. Industrial management investigates all aspects of effluent disposal, taking into consideration the economics of internal treatment or discharge to a public wastewater collection system. Pretreatment prior to discharge to the public system is an important consideration of management. Choice of method involves a comprehensive study of treatment processes. Pilot studies should be made on site. Testing services are available through the government on a repayment basis. Consulting arrangements also may be made with private firms. Control agencies sample outfalls and may initiate legal action against industrial plants with notification and submission of duplicate samples to the plant. Committees of the Confederation of British Industry and the Chemical Industries Association advise industrial operations and act as liaisons between industry and government. The range of treatment and capital costs for pollution abatement facilities is reported. (Knapp-USGS)

TUBE CLARIFICATION PROCESS, OPERATING EXPERIENCES,
Neptune Microfloc, Inc., Corvallis, Oreg.
Gordon L. Culp, Kou-ying Hsiung, and Walter R. Conley.
J San Eng Div, Amer Soc Civ Eng, Vol 95, No SA5, Proc Paper 6823, p 829-847, Oct 1969. 11 fig, 2 tab, 12 ref.

Descriptors: *Operations, *Sedimentation, *Sediments, *Design, Costs, Waste water, Tertiary treatment, Filtration, Water treatment, Sewage treatment, Construction, Filtration.
Identifiers: *Clarification, *Shallow-depth-sedimentation, *Tube-clarifier system, Primary treatment, Secondary treatment, Raw water treatment, Pilot tests.

The use of small diameter tubes as efficient sedimentation devices has been demonstrated successfully on a plant scale. Shallow settling depths provided by longitudinal flows through tubes results in more efficient clarification at shorter detention times and less cost than for conventional clarification metods. Tubes may be essentially horizontal such that tube clarification is followed by a filtration process and settled solids in tubes drained incident to filter backwasher. By steeply inclining the tubes, settled solids do not accumulate in tubes but slide into the plenum beneath the tubes, precluding tube drainage. Modules of steeply inclined tubes have increased the capacity of clarifiers from 2 to 4 times. Steeply-inclined tube process has been applied to raw water clarification, primary, secondary and tertiary sewage treatment in plants up to 45 mgd capacity. The size and cost of new clarifiers can be reduced by including the tube concept in the original design and construction. (D'Arezzo-Texas)

GRAVITY THICKENERS FOR ACTIVATED SLUDGE,
Alexander Potter Associates, New York.
Anton E. Sparr, and Vincent Grippi.
Journal Water Pollution Control Federation, Vol 41, No 11, Part 1, p 1886-1904, Nov 1969. 12 fig, 1 tab, 26 ref.

Descriptors: *Activated sludge, *Coagulation, *Compaction, Sludge, Disinfection, Equipment, Solid wastes, Temerature, Wastewater.
Identifiers: *Sludge density index, *Sludge volume index, *Thickening, *Sludge-volume ratio, *Bench-scale study, Coring, pH, pilot-plant study.

This study investigates the use of gravity thickening of excess sludge from complete treatment activated sludge processes. Factors affecting the concentration in separate thickening tanks of activated sludge alone, or combined with primary sedimentation solids, are discussed. A bench-scale study and historical review are sources of basic data for the investigation. Major subdivisions of the study include: tank geometry, types of thickener, mechanical equipment, influent baffling, skimmers, mechanical compactors, sludge pumps, solids concentration, temperature, loading, pH, coagulation, disinfectants and weighting agents. Mechanical deflectors and rake arms are suggested for more efficient thickening. (D'Arezzo-Texas)
W70-03914

TEMPERATURE EFFECTS ON ENERGY OXYGEN REQUIREMENTS IN BIOLOGICAL OXIDATION,
Weston (Roy F.), Inc., West Chester, Pa.
C. S. Shih, and V. T. Stack, Jr.
Journal Water Pollution Control Federation, Vol 41, No 11, p R461-R474, Nov 1969. 7 fig, 9 tab, 17 ref.

Descriptors: *Oxidation, *Oxygen demand, *Synthesis, *Temperature, Activated sludge, Respiration, Dissolved oxygen, Aerobic conditions, Degradation.
Identifiers: *Energy oxygen, *Dehydrogenase, *Enzyme activity, Organic substrates, Warburg study, Energy oxygen coefficient, Glucose, Sodium acetate, Ethylene glycol, Potassium hydrogen phthalate, DO Uptake, Short term oxygen demand, Tube-run.

Temperature effects on energy oxygen requirements are considered a key quantitative parameter in the aerobic biological oxidation phase of waste treatment. Energy oxygen is the net consumption of oxygen in support of synthesis reactions. The energy oxygen coefficient is the total energy oxygen consumption less endogenous oxygen divided by organic substrate material. Biological oxidation studies were made for various organic substrates at different temperature conditions. Two different evaluation methods were used: (1) graphical integration of dissolved oxygen uptake versus time; (2) short term oxygen demand. The coefficient varies with the substrates oxidized and temperature. The role of dehyrogenase activity analysis in biological oxidation is also examined. (D'Arezzo-Texas)
W70-03919

FERMENTATION OF SPENT SULFITE LIQUOR FOR THE PRODUCTION OF VOLATILE ACIDS,
Crown Zellerbach Corp., Camas, Wash. Microbiological Research.
H. R. Amberg, T. R. Aspitarte, and J. F. Cormack.
Journal Water Pollution Control Federation, Vol 41, No 11, Part 2, p R419-R430, Nov 1969. 4 fig, 9 tab, 18 ref.

Descriptors: *Fermentation, *Volatility, *Acids, *Solvent extractions, Distillation, Productivity.
Identifiers: *Acetic acid, *Calcium base liquors, *Microbacterial action, Spent sulfite, Liquors, Volatile acids, Microbial flora, Othmer azeotropic, Distillation process, Suida process, Brewster process.

Study and experiments were made to determine if volatile acids, specifically acetic acid, could be produced by fermentation of sugars in spent sulfite liquor. Substrates used for experiments were: (1) steam-stripped digester strength calcium base spent sulfite liquor; (2) residual alcohol-fermented spent sulfite liquor. Fermentations were made successfully on a continuous-flow basis using mixed bacterial culture. Specific major determinations were: (1) Optimum volatile acid yields were obtained amounting to 155 Kg per metric ton at volumetric waste retention periods of 20 to 30 hours, (2) optimum fermentation temperature was 37 deg C and optimum pH range was 7.0 to 7.5; (3) solids content of the raw feed liquor had a decided effect of yield; (4) optimum yield was obtained at 9 to 11 percent total solids; (5) the most economical method of acetic acid recovery is solvent extraction followed by azeotropic distillation for solvent recovery. (D'Arezzo-Texas)
W70-03921

A BREAKTHROUGH IN THE TRACER STUDIES OF SEDIMENTATION TANKS,
Nova Scotia Technical Coll., Halifax. Dept. of Civil Engineering.
D. Thirumurthi.
J Water Pollution Control Federation, Vol 41, No 11, Part 2, p R405-R418, Nov 1969. 9 fig, 5 tab, 22 ref.

Descriptors: *Tracers, *Dispersion, *Sedimentation, *Costs, *Design, Baffles, Inlets, Outlets, Diatomaceous earth, Diffusivity, Dye releases, Fluorometry, Suspension, Settling basins, Reynolds number.
Identifiers: *Pulse input technique, *Plug flow, *Detention time, *Flow-through curve, Tracer studies, Index of short-curcuiting, Critical settling depth, Peclet number, Morril index, Dispersion index, Continuous-flow systems, Settling index.

Increasing costs of waste treatment compel design-oriented research with view toward reducing treatment costs. Sedimentation is considered a vital phase justifying closer analysis. Tracer studies and sedimentation tests were conducted on two continuous-flow laboratory model settling tanks of similar geometry except length-width ratios. Tracer studies of pulse input technique were made to demonstrate that two selected parameters were reproducible and useful as design criteria for sedimentation systems. The study is unique in the fact that results of tracer tests have been inter-related with results of sedimentation tests on the continuous-flow models. The deviation of real systems from the ideality has been considered. A design formula for actual sedimentation tanks has been suggested. Further studies or simulations are needed to validate the suggested design formula. A method is developed to evaluate the relative advantages of geometric design features of sedimentation tanks. (D'Arezzo-Texas)

DIPLOGASTERID AND RHABDITID NEMATODES IN A WASTEWATER TREATMENT PLANT,
Louisiana Polytechnic Inst., Ruston. Dept. of Zoology; and Southfield School, Shreveport, La.
J. L. Murad, and G. T. Bazer.
Journal Water Pollution Control Federation, Vol 42, No 1, p 106-114, Jan 1970. 4 fig, 4 tab, 11 ref.

Descriptors: *Aerobic treatment, *Wastewater, *Trickling filters, *Effluents, Wastewater treatment, Settling basins.
Identifiers: *Nematode, *Secondary clarifiers, *Primary clarifier, *Diplogasterid, *Rhabditid, Christie-Perry technique, Ruston (La).

Nematode population samples from various, likely breeding sites in aerobic waste treatment process at wastewater treatment plant, Ruston, Louisiana were analyzed for 15 weeks. The main breeding site, and the main source of the nematodes found in the final effluent was the trickling filter. Secondary clarifiers and final settling tanks effectively removed the nematodes. Nematode removal was highest in the dilution stream under high flow conditions than during normal stream flow. Solids in the effluent were more efficient in removing ne-

matodes in suspension. Settling without the addition of stream bottom solids provided a 17.1% removal whereas the addition of solids caused a 32.2% removal. (D'Arezzo-Texas)
W70-03925

BIODEGRADABILITY AND TREATABILITY OF COMBINED NYLON AND MUNICIPAL WASTES,
Rhode Island Univ., Kingston. Dept. of Civil Engineering.
C. P. C. Poon.
Journal Water Pollution Control Federation, Vol 42, No 1, p 100-105, Jan 1970. 1 fig, 8 tab, 2 ref.

Descriptors: *Biodegradation, *Industrial wastes, *Treatment, *Wastewater treatment, *Waste disposal, Degradation, Biochemical oxygen demand, Chemical oxygen demand, Aeration, Activated sludge.
Identifiers: *Nylon, *Nylon waste, *Municipal wastes, pH, Warburg respirometer, Belding Chemical Co. (Conn), Thomaston (Conn).

Nylon waste contains high organic content, large amount of solvents and low pH. The solvents can be recovered economically; therefore, it is advisable to separate the nylon production process waste from the others for recovery purposes. The other wastes can be combined and treated successfully with municipal wastewater. The amount of nylon wastewater which can be accepted by the municipal plant can be determined by specified laboratory studies. It was shown that nylon waste from the Belding Chemical Co. could combine successfully with municipal wastewater at the Thomaston Plant at a rate of 1:7 for successful treatment after pH neutralization. Laboratory study involved Warburg respirometer and batch feed aerator. The average chemical oxygen demand removal was 88% at a loading of 0.85 lb COD/day/lb of MLVSS. (D'Arezzo-Texas)

PHYSICOCHEMICAL TREATMENT OF WASTEWATER,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering; and FMC Corp., Princeton, N.J.
W. J. Weber, C. B. Hopkins, and R. Bloom, Jr.
Journal Water Pollution Control Federation, Vol 42, p 83-99, Jan 1970. 10 fig, 1 tab, 14 ref.

Descriptors: *Water reuse, *Waste treatment, *Activated carbon, *Adsorption, *Biochemical oxygen demand, *Sewage treatment, Costs, Nitrates, Phosphates, Tertiary treatment.
Identifiers: *Advanced waste treatment, *Chemical removal, *Physicochemical treatment, Secondary treatment, Total organic carbon, Ewing-Lawrence Sewerage Authority (ELSA), Trenton (New Jersey).

Conventional 'secondary' biological waste treatment processes are inadequate to provide the effluent quality needed for water reuse purposes or to provide a satisfactory degree of pollution protection to receiving natural water bodies, based on anticipated, more stringent future demands. A process using chemical clarification, filtration, and adsorption by activated carbon for treatment of primary wastes was designed and tested on a pilot-scale basis. This physicochemical treatment process is a major departure from the costlier practice of tertiary treatment methods following conventional secondary treatment. The system was designed for essentially automatic operations. The physicochemical pilot model phase was operated continuously for 4 months. Consistent total organic carbon and biochemical oxygen demand removals of 95-97%, phosphate removals of 90% and nitrate removals of 95% were obtained. Costs are about $0.16/1,000 gal, including capital amortization. Process affords flexibilities to expand on a modular basis and to intensify degree of treatment. (D-'Arezzo-Texas)

ANIONIC AND NONIONIC SURFACTANT SORPTION AND DEGRADATION BY ALGAE CULTURES,
Texas Univ., Austin. Dept. Environmental Health Engineering.
Ernst M. Davis, and Earnest F. Gloyna.
Journal of the American Oil Chemists' Society, Vol 46, No 11, p 604-608, Nov 1969. 2 fig, 3 tab, 9 ref.

Descriptors: *Surfactants, *Sorption, *Algae, Chlorophyta, Cyanophyta, Detergents, Spectroscopy.
Identifiers: *Linear alkyl sulfonates, *Axenic cultures, *Alkyl polyethoxylate, *Alkyl phenol polyethoxylate, Organic extractions, Infrared spectroscopy, Blue-green algae, Green algae.

Investigation was made to determine effects of axenic cultures of 5 species of Cyanophyta algae and 3 species of Chlorophyta algae, which are common to waste stabilization ponds, on ionic and anionic surfactants contained in the bulk of household detergent products. Tests made to determine the sorption characteristics of the surfactants by the algae showed releases and degradation of up to 99% of some of the component parts of the surfactant molecule. Comparative tests using a heterogeneous microcosm associated with laboratory acclimated stabilization pond water showed capability of greater reduction of all surfactant components than the individual algae species. The tests confirmed the feasibility of using infrared spectrophotometric analysis techniques and the adequacy of organic solvents for extraction of surfactants prior to complexation in concentrations of and below 50 mg/l. DIALYSIS SEPARATION OF SEWAGE SLUDGE DIGESTION,
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
M. J. Hammer, and J. A. Borchardt.
J Sanit Eng Div, Proc Amer Soc Civ Eng, Vol 95, No SA5, Paper 6845, p 907-928, Oct 1969. 17 fig, 9 tab, 5 ref.

Descriptors: *Dialysis, *Fermentation, *Sewage sludge, Sewage treatment, Digestion, Digestion tank, Microbiology, Microorganisms.
Identifiers: *Anaerobic, *Acidification, *Gasification, *Dialysis fermentation tank, Diffusion, pH, Electrode potential, Membrane, Vinyl plastic, Alkalinity, Volatile acid, Digestion gases, Hydrolysis methane.

The acidification and gasification stages of high-rate anaerobic digestion are studied separately, using a dialysis-fermentation tank apparatus unique to sanitary engineering research. Raw sludge fed into the tank provided substrate for bacterial production of volatile acids. The acids were then diffused through the plastic membrane in the dialysis unit, into the methane fermentation tank for conversion to gaseous end products. The process of sludge digestion can be performed using a dialysis-fermentation tank system. This system permits pseudo-enrichment culturing of the anaerobic sludge digestion stages (acidification and gasification) to take place in separate fermentation tanks. The acidification stage is the rate-limiting process. The acid fermenters operate at sub-optimum conditions to permit optimum conditions needed for methane fermentation of the volatile acids. PHOSPHATE REMOVAL AT BALTIMORE, MARYLAND,
Robert S. Kerr Water Research Center, Ada, Okla.
M. R. Scalf, F. M. Pfeffer, L. D. Lively, J. L. Witherow, and C. P. Priesing.
J Sanit Eng Div, Proc Amer Soc Civ Eng, Vol 95, No SA5, Paper 6817, p 817-827, Oct 1969. 6 fig, 1 tab, 4 ref.

Descriptors: *Activated sludge, *Aeration, *Phosphates, Phosphorous, Sewage treatment, Municipal wastes.
Identifiers: *Pilot investigation, *Plant investigation, *Activated sludge treatment, Dye tracer, Biochemical oxygen demand, Mixed liquor suspended solids, Baltimore (Md), San Antonio (Tex).

Pilot and plant investigations were conducted at Baltimore to determine if high orthophosphate removal process experienced at San antonio, Texas was applicable and feasible in Baltimore, differing in climate, population served and population characteristics. Phosphate removal by activated sludge at Baltimore was a function of mixed liquor dissolved oxygen concentration, BOD loading, and soluble phosphorous loading. Plant research showed in excess of 90% soluble phosphorous removal coinciding with plug flow conditions in the aeration tanks and high dissolved oxygen concentrations in the mixed liquor and final clarifiers. Pilot studies using aerated containers of mixed liquor containing plant return sludge and primary effluent predicted the reaction of the plant activated sludge process. A minimum mixed liquor suspended solids concentration of 1200 mg/l is needed for over 99% phosphate removal at Baltimore. Using mixed liquor suspended solids concentration similar to plant conditions showed: (1) Increased orthophosphate load needed longer aeration for phosphate removal; (2) Increased BOD caused greater initial phosphate concentrations; (3) Increased aeration rates decreased the phosphate removal time. The investigation showed that phosphate removal by the activated sludge process is not unique to the San Antonio, Texas area. (D'Arezzo-Texas)

TRICKLING FILTER MODEL: DESIGN AND COST FACTORS,
Robert A. Taft Water Research Center, Cincinnati, Ohio.
Joseph F. Roesler, and Robert Smith.
Industrial Water Engineering, Vol 6, No 9, p 46-49, Sept 1969. 8 fig, 6 ref.

Descriptors: *Trickling filters, *Mathematical models, *Design, *Cost allocation, *Biochemical oxygen demand, Waste water treatment, Efficiencies, Capital costs, Operation and maintenance, Computers.

A mathematical model of a trickling filter final settling process was described in the study. The model constituted a single subroutine in a computer program involving the preliminary design of wastewater treatment systems. The subroutine specifically computed the relationship of the various physical properties of the trickling filter, BOD removal efficiencies, and costs. The latter included capital, operating and maintenance costs for the trickling filter, final settler and return pumps. The costs to remove BOD was plotted against the hydraulic loading. For filter depths of 6 and 20 feet, minimum costs were observed near hydraulic loadings of 10 and 20 mgd per acre, respectively. Plots of total costs rather than costs per BOD removed indicated that the greater the specific area, the lower the costs. (Thiuri-Cornell)

RECLAIMED WASTEWATER FOR SANTEE RECREATIONAL LAKES,
Public Health Service, San Diego, Calif. Santee Recreation Project.
John C. Merrell, Jr., and Alberg Katko.
Journal of the Water Pollution Control Federation, Vol 38, No 8, p 1310-1318, 1966. 2 fig, 7 tab, 3 ref.

Descriptors: *Recreation, *Recreation facilities, *Water quality, Safety, Boating, Fishing, Water utilization, Oxidation lagoons, Activated sludge, Coliforms, Waste water treatment, Water reuse.
Identifiers: *Fecal coliforms, *Fecal streptoccoci blooms, Santee Recreational Lakes (Calif), California, Water reclamation.

The Santee Project in San Diego County, California, has evolved into a reasonably well-balanced

ecological system utilizing wastewater of the community as the productive source of a central aquatic environment that is socially accepted as recreational lakes. Following conventional activated sludge sewage treatment and a 30-day nominal storage in an oxidation pond, the effluent is pumped to a natural shallow aquifer in the valley above the lakes and later recovered as rising groundwater flow for use in three adjacent recreational lakes. Sand filtration increased removals of organics and nutrients to the 98-99% range. A nutrient balance, a comparison of chemical constituents, bacterial concentrations, and virus findings between the secondary effluent and the lakes is presented. The ecological development of these lakes is summarized; diverse algal population, occasional algal blooms, and fish kills are described. Different facets of the biological life, including phytoplankton, zooplankton, aquatic insects, benthic organisms and fisheries are presented. (Haskins-Wisconsin)

REMOVAL OF SEWAGE NUTRIENTS BY ELECTROLYTIC TREATMENT,
Oslo Univ. (Norway). Inst. of Marine Biology.
Ernst Foyn.
Verhandlungen der Internationalen Vereinigung fur theoretische und angewandte Limnologie, Vol 15, p 569-579, Feb 1964. 6 fig, 5 tab, 5 ref.

Descriptors: *Sewage, *Sludge, *Sewage effluents, *Sewage treatment, Phosphates, Sludge disposal, Electrolysis, Biochemical oxygen demand, Eutrophication, Pilot plants, Ammonia, Nitrogen, Hydrogen ion concentration, Sea water.
Identifiers: Turbidity, Elkem electrolytic process, Reagent recovery, Oslo, Magnesium ions, Oslofjord (Norway), Norway.

The Elkem electrolytic sewage purification process removes raw sewage from sludge, suspended particles, and bacteria, and reduces the content of phosphates to 1.0-1.5 milligram/liter of the effluent. The fraction of removed phosphates depends on the amount of applied electricity, and 200 ampere-hours per cubic meter were found to be most efficacious. The purified effluent was active in reducing the biochemical oxygen demand in untreated sewage. The water content of the sludge was reduced 60% by filtration through open sieves. (Wilde-Wisconsin)

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES: SUMMARY REPORT,
Bechtel Corp., San Francisco, Calif.
E. J. Wasp, T. L. Thompson, P. E. Snoek, J. P. Kenny, and J. C. Carney.
Available from the Clearinghouse as PB-189 756, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report DAST-16, Dec 1969. 31 p, 13 fig. FWPCA Contract 14-12-156. FWPCA Program 14010 EMS.

Descriptors: *Transportation, *Slurries, *Pipelines, *Waste disposal, Sewage sludge, Land disposal, Continental shelf, Environmental effects, Cost benefit analysis, Institutional constraints, Great Lakes region, Atlantic coastal plain.
Identifiers: Northeast Ohio, Baltimore-Washington, Maintenance dredgings, Fly ash, Water treatment, Plant residues.

This is the summary report of a three volume study principally concerned with the development of regional land and ocean pipeline disposal systems for digested sewage sludge and maintenance dredgings. In Volume I two study cases are presented, namely, a land disposal system for Northeast Ohio (Cleveland-Canton) and an ocean disposal system for the Baltimore-Washington region. A systems approach is used, in which collection, transportation, and disposal aspects are examined in light of technical, economic and social requirements. Various transport modes are compared, including pipeline, ocean tankers, railroads, and trucks. To a lesser extent, the study also considers the expansion of such systems to include fly ash and water treatment plant sludge. In Volume II present methods and costs of disposal for all four wastes are reviewed. Environmental criteria are presented for examining both land and ocean sludge disposal alternatives in terms of general solution for two broad metropolitan regions, namely, the Great Lakes region from Buffalo to Milwaukee and the Atlantic Coast region from Boston to Norfolk. Results of a loop test program utilizing 12 in and 16 in pipe for pumping digested sludge, fly ash, and sludge-fly ash slurries are included in Volume III as well as corresponding rheological tests with a 1/2 in small tube viscometer and a rotational lab viscometer. A procedure for predicting head losses is given, as well as a review of the state of the art of pipelining of waste materials. (See also W70-04005 thru W70-04007)

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES: VOLUME I - THE WASTE MANAGEMENT CONCEPT.
Bechtel Corp., San Francisco, Calif.

Available from the Clearinghouse as PB-189 757, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report DAST-16, Vol 1, Sept 1969. IX, 156 p, 33 fig, 31 tab, 14 ref, 4 append. FWPCA Contract No 14-12-156 Project No 14010 EMS.

Descriptors: *Waste disposal, *Sludge disposal, Municipal wastes, Landfills, Systems analysis, Cost-benefit analysis, Sanitary engineering, Waste dumps, Agriculture, Dredging, Land management, Pipelines, Fertilizers, Sewage sludge, Fly ash.
Identifiers: Sludge transport, Solid waste disposal.

Development of a specific waste management system which collects, transports and disposes of sewage sludge and maintenance dredgings in a socially, technically, and economically satisfactory fashion was studied by systems analysis. The feasibility of constructing and operating a demonstration project was examined. A major effort in this area is the demonstration project by the Metropolitan Sanitary District of Greater Chicago using sewage sludge for agriculture. For each detailed study case, a disposal system is proposed which effectively serves regional needs, is economically sound, and includes the collection, transportation and disposal of the estimated production of wastes up to the year 2000. The economics of the systems are presented and recommendations are made as how to achieve both immediate and long-term objectives. For an immediate solution to the national problem of waste disposal of digested sewage sludge, a land disposal system is recommended. A long-term, successful history of beneficially using sludge on land is available. The cost benefit ratio of the sludge disposal system is very favorable. A demonstration project is recommended to prove the viability of the concept. Pipeline transportation is economically better than the other modes evaluated. (See also W70-04004). (Knapp-USGS)

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES: VOLUME II - CRITERIA FOR WASTE MANAGEMENT,
Bechtel Corp., San Francisco, Calif.
P. E. Snoek.
Available from the Clearinghouse as PB-189 758, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report DAST-16, Vol 2, Sept 1969. 144 p, 10 fig, 16 tab, 184 ref, append. FWPCA Contract No 14-12-156 Project No 14010 EMS.

Descriptors: *Waste disposal, *Sludge disposal, Municipal wastes, Landfills, Cost-benefit analysis, Sanitary engineering, Waste dumps, Agriculture, Dredging, Fertilizers, Land management, Pipelines, Sewage sludge, Fly ash.
Identifiers: Sludge transport, Solid waste disposal.

Basic environmental criteria were studied for disposal of selected waste materials, including sewage treatment pland sludge, maintenance dredgings, power plant fly ash, and filter plant residues. Both land and ocean disposal alternatives were examined in terms of a general solution for 2 broad regions, namely the Great Lakes Megalopolis from Milwaukee to Buffalo and the Atlantic Coast Megalopolis from Boston to Norfolk. Present methods and costs of disposal have been included to complete the picture of the overall waste disposal problem. (See also W70-0440). (Knapp-USGS)

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES: VOLUME III - TECHNICAL ASPECTS OF PIPELINING OF WASTE MATERIALS,
Bechtel Corp., San Francisco, Calif.
J. P. Kenny.
Available from the Clearinghouse as PB-189 759, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series Report DAST-16, Vol 3, Sept 1969. 167 p, 80 fig, 15 tab, 64 ref, 3 append. FWPCA Contract No 14-12-156 Project No 14010 EMS.

Descriptors: *Sludge disposal, *Hydraulic transportation, *Pipelines, *Hydraulics, *Slurries, Waste disposal, Closed conduit flow, Pipe flow, Turbulent flow, Suspension, Mixing, Fly ash, Sewage sludge, Municipal wastes, Sanitary engineering.
Identifiers: Sludge transport, Solid waste disposal.

The feasibility of using pipelines to transport waste materials, and to develop a reliable procedure for the design of such pipelines was studied. A series of laboratory and pipeline tests was performed. Digested sewage sludge and fly ash were chosen as representative materials for the tests. Both materials, sludge because of its fibrous nature and fly ash because the particles are very fine, were transported in homogenous flow in the turbulent regime. Samples taken from the top and the middle of the pipe test sections confirmed this. These materials, individually and in various combinations, were tested at various velocities in 1/2-inch, 12-inch, and 16-inch pipe test sections, for a number of solids concentrations. Digested sludge, fly ash, and fly ash/sludge mixtures can be successfully transported by pipelines. (See W70-04004). (Knapp-USGS)

PRIVATE SEWER SYSTEMS.

Ohio Rev Code Ann secs 6112.01 thru 6112.05, 6112.99 (Page Supp 1970).

Descriptors: *Ohio, *Sewage disposal, *Water pollution control, *Eminent domain, Sewage, Legislation, Wastes, Sanitary engineering, Waste disposal, Sewage districts, Sewers, Waste water disposal, Pollution abatement, Condemnation, Local governments, Administrative agencies, Planning.

Any person may apply to the Department of Health for approval of plans for the construction of a sewage disposal system to serve any geographical area not served by another system. The application must include data establishing the need for the system, as well as surveys and maps necessary to determine the boundaries of the area to be served. The local board of county commissioners certifies that the area is not served by another system. After receiving notice from the Public Utilities Commission that an authorizing certificate has been issued, the Department may act on the application. Construction of the facilities must be supervised by a registered engineer. Any board of county commissioners may purchase or appropriate any system constructed under these sections within its county. The appropriation procedure is the same as the one provided for use by municipal corporations. Maximum penalty for violating these sections is five hundred dollars. (Douberley-Florida)
W70-03736

SEWER DISTRICTS.
Ohio Rev Code Ann sec 6117.01 (Page, 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Sewage districts, *Sewers, *Waste disposal, Legislation, Sewage, Sanitary engineering, Sewage disposal, Sewage treatment, Waste water disposal, Outlets, Ditches, Channels, Public health, Regulation, Planning, Project planning, Administrative agencies.

Boards of county commissioners may establish and maintain sewer districts within their counties and outside of municipal corporations. The boards may acquire, construct, maintain and operate sewers, ditches or channels within their district and any other works within and without such districts as are necessary to carry water to a proper outlet for treatment or disposal. Any board may employ a sanitary engineer and establish a sanitary engineering department. The boards may enact rules and regulations concerning: (1) sewer systems outside municipal corporations; (2) sewer systems inside municipal corporations when they are operated by the board; or (3) municipal corporations' sewer systems which discharge into facilities operated by the board. No sewers or treatment plants may be constructed outside municipal corporations without approval of the plans by the board and supervision of the construction by the county sanitary engineer. (Douberley-Florida)

SEWERS AND WATERWORKS.
Tenn Code Ann secs 6-1401 thru 6-1439 (1956), as amended, (Supp 1969).

Descriptors: *Tennessee, *Sewers, *Water works, *Cities, Legislation, Legal aspects, Eminent domain, Construction, Maintenance, Damages, Public health, Wastes, Water supply, Sewage disposal, Pumping plants, Treatment facilities, Storage, Water purification, Costs, Administrative agencies, Contracts, Financing, Land tenure, Waste disposal, Sewage treatment, Operation and maintenance, Supervisory control (Power).
Identifiers: *Water systems, Bonds.

All cities are authorized to condemn property and property rights for the purpose of constructing, laying, repairing or extending sewers, water systems or drainage ditches. In order to protect the public health and assure the payment of sewer bonds, cities may require occupants of land abutting sewer systems to connect to such systems and be charged for the use thereof. Two cities may contract for one to use the sewer and water system of the other, or for the joint construction and use of such a system. Every city is authorized to own and operate a waterworks system and a sewerage system. A waterworks system includes supply sources, pumping facilities, purification works, storage facilities and a distribution system. A sewerage system includes a collecting system, intercepting and outfall sewers, pumping stations and treatment, purification and disposal plants. Every city acquiring a waterworks or sewerage system is required to establish a board to have supervision and control of construction and operation of such works. The board will advise the city regarding the necessity of the financing and acquisition of land for new works. The financing of works is provided for by rate collection, bond issuance and other means. (Keith-Florida)

SEWER DISTRICTS: ST. LOUIS COUNTY.

Mo Ann Stat secs 249.010 thru 249.420 (1959).

Descriptors: *Missouri, *Sewage districts, *Sanitary engineering, *Taxes, Construction, Maintenance, Sewerage, Public health, Sewers, Assessments, Judicial decisions, Human population, Boundaries (Property), Drainage, Surveys, Maps, Costs, Administrative agencies, Compensation, Interest, Debt, Financing, Contracts, Laterals, Sewage disposal, Legislation, Pollution.

The circuit court may establish a sewer district for the construction and maintenance of a sewer system in St. Louis County upon petition of, and approval by, the residents of the proposed district. After the filing of such petition, the judge shall appoint a sanitary engineer to establish boundaries, make surveys and maps, and prepare a plan for sewer construction in the proposed district. A general election shall be held to approve taxes to be levied, indebtedness to be incurred, and selection of the district trustees. If approved, the trustees may issue bonds and assess taxes to pay expenses of the district. The boundaries of this district may be extended. Qualifications for trustees, the method of their selection, and administrative procedure to be followed are provided. The trustees may: (1) employ an engineer to develop sewer plans; (2) construct and maintain all necessary sewer structures and systems; (3) make necessary contracts; (4) acquire property by condemnation or otherwise; (5) construct sewerage disposal plants; (6) employ and compensate necessary personnel; (7) establish subdistricts with lateral sewer systems; and (8) collect rent from property abutting said lateral sewers. (Dearing-Florida)
W70-03767

SANITARY DRAINAGE DISTRICTS-CITIES OVER 300,000 INHABITANTS AND ADJOINING COUNTIES.
Mo Ann Stat secs 248.010 thru 248.200 (1959).

Descriptors: *Missouri, *Drainage districts, *Sanitary engineering, *Sewers, Construction, Maintenance, Drainage systems, Channels, Administrative agencies, Judicial decisions, Civil engineering, Drains, Surveys, Maps, Expenses, Compensation, Outlets, Taxes, Assessments, Legislation, Legal aspects, Drainage programs, Sewage, Right-of-way, Easements, Condemnation, Contracts.
Identifiers: *Sanitary districts.

A sanitary district may be established and incorporated by the circuit court whenever the construction and maintenance of a channel or system of drains or sewers is needed for the drainage of any area. Three commissioners appointed by the court shall supervise the district. They shall formulate plans for the drainage system, and if approved by the voters in the district, the court shall order the district to be established. Districts may include more than one county. Selection procedures for a board of trustees of the district are provided. The board may divide the districts into independent subdistricts. The district may acquire rights-of-way or easements by requesting condemnation proceedings by the proper city or county authority. The board of trustees may let contracts for all proposed works. A special tax may be levied on lands within the district and bonds may be issued to pay district expenses. Sewers and special drains may be constructed and funded from special taxes on the areas benefited. The district shall be dissolved when the necessary drainage is completed. (Dearing-Florida)
W70-03768

LIQUIDATOR FOR SEWER DISTRICTS IN CERTAIN COUNTIES.

Mo Ann Stat secs 249.670 thru 249.700 (1959).

Descriptors: *Missouri, *Sewage districts, *Administration, *Decision making, Judicial decisions, Administrative agencies, Taxes, Costs, Government finance, Payment, Debt, Compensation, Legislation.

Whenever any sewer districts with a population greater than seven hundred thousand but less than seven hundred and fifty thousand is dissolved, the Governor shall appoint a liquidator of such sewer district. The liquidator shall have all powers and duties of the board of supervisors of the district subject to approval by the circuit court. The officers and supervisors of the district shall cease to have any further power or duties. The liquidator shall have the power to dispose of all property and effects of the district, contest any action against the district, and compromise any taxes or indebtedness of the district. (Dearing-Florida)
W70-03769

HEALTH AND SAFETY (PUBLIC WATER SUPPLY AND SEWER SYSTEM).
Tenn Code Ann secs 53-2001 thru 53-2016 (1966), secs 53-2017 thru 53-2022 (Supp 1969).

Descriptors: *Tennessee, *Water works, *Water supply, *Public utilities, Water distribution (Applied), Water utilization, Sewage, Pumping plants, Sanitary engineering, Sewage disposal, Sewage dis-

tricts, Sewage treatment, Environmental sanitation, Septic tanks, Drains, Engineering structures, Legislation, State governments, Regulation, Permits, Public health, Operation and maintenance.

The Department of Public Health controls and supervises construction and operation of public water supplies and sewerage systems. All cross-connections and interconnections between primary and auxiliary water supplies must be approved by the Department. The Department may order corrective action to be taken by the operator of any water supply or sewerage system that constitutes a health menace. Procedures are outlined for judicial review of Department orders. The Department is empowered to exercise general supervision over the construction and operation of individual sewage disposal systems for proposed housing subdivisions where public sewage systems are not available. This authority does not exist within city limits. Local health officers are directed to carry out the provisions of this act. Criminal penalties are prescribed for violation of the act. State grants can be made to municipalities for the construction of sewage treatment works. The Department may enter into contracts with municipalities for the construction of proposed water projects. A sewage treatment works account is established to fund authorized activities of the Department. (Barnett-Florida)

SOME EFFECTS OF SHADE COVER ON STREAM TEMPERATURE IN SOUTHEAST ALASKA,
Forest Service (USDA), Juneau, Alaska. Pacific Northwest Forest and Range Experiment Station.
William R. Meehan.
USDA Forest Serv Res Note PNW-113, 1970. 9 p, 1 fig, 4 tab, 6 ref.

Descriptors: *Water temperature, *Vegetation effects, *Aquatic environment, Microclimatology, Alaska, Riparian plants, Watershed management, Cutting management.
Identifiers: Streamside vegetation, Shade effects.

Water temperature differences measured with a precision resistance thermometer over 20-yard intervals show that on clear summer days, shade-producing streamside vegetation is important in cooling or maintaining coolness of small streams. The average temperature increase in unshaded reaches of streams in the Haines-Juneau area was 0.071 deg C. and in the Petersburg-Wrangell area it was 0.164 deg C. In shaded reaches the average temperature decrease was 0.060 deg C. and 0.081 deg C., respectively. Under overcast skies, the effects of shade were very small and the trend was for a slight temperature increase over 20-yard stream reaches--0.011 deg C. and 0.009 deg C., in the two areas. The reasons for the significantly different temperature responses in the two geographic areas are not yet known. (Helmers-Forest Service)
W70-03819

EXAMINATION INTO THE EFFECTIVENESS OF THE CONSTRUCTION GRANT PROGRAM FOR ABATING, CONTROLLING AND PREVENTING WATER POLLUTION.

Report to Congress, Nov 3, 1969. 164 p, 7 fig, 12 append.

Descriptors: *Systems analysis, *Water quality control, *Pollution abateness, *Planning, *Mathematical models, Decision making, Alternative costs, Waste water treatment, Water utilization scheduling.
Identifiers: Alternative schedules.

The study examined the effectiveness of the construction grant program administered by the Federal Water Pollution Control Administration for abating, controlling and preventing water pollution in the United States. The development and use of a systems analysis method, and its practicability in an actual waterway was discussed. A mathematical model was developed by Camp, Dresser and McKee and used to evaluate data on the Merrimack River for estimating the construction costs of water treatment facilities for various degrees of water quality. It was concluded that through the use of the systems analysis approach to planning and implementing water pollution programs (a) a least-cost construction plan to achieve water quality standards could be made, (b) more costly but perhaps desirable alternative schedules could be developed and (c) decision makers would be provided with more meaningful data as to enable them to achieve established objectives and the costs of providing various levels of water uses. (Thiuri-Cornell)

SIMULATION MODEL FOR FLOW AUGMENTATION COSTS,
Florida Univ., Gainesville; and Massachusetts Inst. of Tech., Cambridge.
Armando I. Perez, John C. Schaake, and Edwin E. Pyatt.
J Hydraul Div, Proceedings of ASCE, Vol 96, No HY1, p 131-142, Jan 1970. 1 fig, 6 ref, 2 append.

Descriptors: *Simulation analysis, *Sewage treatment, *Flow augmentation, *Optimization, *Regression analysis, Storage capacity, Costs, Reservoirs, Water quality, Streamflow, Computers.

A generalized mathematical model was developed to permit the simulation of the economic and physical interactions of sewage treatment and low flow augmentation, and subsequent evaluation from a water quality standpoint. An essential phase of the project, a study of low flow augmentation storage costs was analyzed. The main objective was to obtain optimum functional relationships between the storage volume required and those variables that were found to affect it. The results could then be integrated with regional cost curves to give generalized cost expressions. Initially, monthly streamflow and demand records were generated from historical data by a computer program. The operation of various reservoir sizes was simulated and the number of deficiencies during the time period considered were counted. After this process was repeated for several combinations of values of the variables, the desired regression, or the 'best fit', equation was derived which related storage volume required to these parameters. SEWERAGE - WATER WORKS.

Mo Ann Stat secs 250.010 thru 250.250 (1959).

Descriptors: *Missouri, *Public health, *Sewage districts, *Water pollution control, Water works, Legislation, Legal aspects, Cities, Construction, Maintenance, Treatment facilities, Waste disposal, Sewers, Water purification, Liquid wastes, Solid wastes, Industrial wastes, Domestic wastes, Administrative agencies, Costs, Assessments, Taxes, Financing, Rates, Planning, Leases, Pollution abatement, Water supply, Water quality.
Identifiers: *Bonds, *Sewer districts, Improvements.

Cities and sewer districts are authorized to acquire, construct, improve, extend, maintain and operate sewerage systems for the protection of the public health. 'Sewerage system' means storm water systems, sanitary systems, sewerage systems, sewerage treatment plants and collection, purification and disposal facilities. Two or more cities are authorized to operate combined waterworks and sewerage systems. Cities may delegate to their boards of public works the responsibility for and control of combined systems. The cost to any city or sewer district of acquiring, constructing, improving or extending a sewerage system or combined system will be financed through tax levies, assessments, general revenue funds or bond issuances. Cities and sewer districts are authorized to charge reasonable rates for the use of their sewerage systems. Cities may charge industrial establishments for the operation by the city of sewerage facilities to abate or reduce industrial water pollution. It is the purpose of this chapter to enable cities and sewer districts to protect the public health and welfare by preventing or abating water pollution and by supplying wholesome water. Cities and sewer districts are empowered to do all things necessary to carry out these purposes. (Keith-Florida)

THE FUTURE OF THE NORTH CAROLINA COASTAL AREA.

National Estuarine Pollution Study, The Future of the North Carolina Coastal Area, p 1-12 (1969).

Descriptors: *North Carolina, *Estuaries, *Water pollution, *Administration, Management, Water policy, Water resources development, Water zoning, Regulation, State governments, Aquatic habitats, Estuarine fisheries, Estuarine environment, Oceanography, Local governments, Federal government, Fish management, Project planning, Recreation, Impaired water quality, Pollutants, Legal aspects.

The responsibility for regulation of North Carolina's estuaries should rest with state and local governments. The federal government should provide guidance, advice, and services only where the problems are beyond the capability of the state. Some commentators would prefer federal control of estuaries. Planned zoning should be used to prevent pollution resulting from indiscriminate development and filling in estuarial areas. A comprehensive system of land and water management should be implemented. Burgeoning industry in estuarine areas should be regulated to prevent pollution, but unduly restrictive water quality standards might damage the state's economy. Pollution of estuaries injures the fish population. Recreational uses of waterways require clean water. Uniformity of laws controlling waste from pleasure craft is necessary. Tourism is a large factor in the economy of North Carolina. Research in environmental ecology is best conducted by universities. Studies should be made of: (1) the biological contributions of estuaries to continental shelf waters, (2) the environmental effects of pesticides, (3) the assimilation capacities of the sounds, (4) the biological effects of industrial and domestic wastes, and (5) a comparison of the water levels in estuaries and the sea. GENERAL SEWER SYSTEM.
Mo Ann Stat sec 88.801 (Supp 1970).

Descriptors: *Missouri, *Sewage disposal, *Municipal wastes, *Taxes, Assessments, Government finance, Sewage districts, Sewage treatment, Sewers, Environmental sanitation, Wastes, Waste water disposal, State governments, Legislation, Cities, Regulation.

All cities in this state containing more than ten thousand and less than thirty thousand inhabitants and possessing special charters are empowered to establish general sewer systems. There are four classes of sewer systems: public, district, joint district, and private. Public sewers shall be established along principal courses of drainage at such time, to such extent, of such dimensions and under such regulations as provided by municipal ordinance. The city may levy a 'special public sewer tax' over all taxable property within the city. (Dye-Florida)
W70-04033

PRIVATE SEWERS.
Mo Ann Stat secs 88.813 thru 88.817 (1952).

Descriptors: *Missouri, *Sewage disposal, *Municipal wastes, *Sewage districts, Assessments, Government finance, Sewage treatment, Sewers, Environmental sanitation, Wastes, Waste water disposal, State governments, Legislation, Legal aspects, Regulation, Cities, Condemnation.

Private sewers may be connected to public or district sewers and regulated by city ordinance. The city shall not assume the costs of construction, repair, or cleaning of private sewers. Expenses incurred for maintenance of district and joint district sewers are paid out of the general appropriation for that purpose. The city may condemn property necessary for the construction of any sewer. Where a sewer is laid on uncondemned property, the city may be compelled by mandamus or other appropriate action to exercise its right of condemnation. (Dye-Florida)
W70-04034

PRIVATE SEWERS.
Mo Ann Stat sec 64.300 (1966).

Descriptors: *Missouri, *Sewers, *Sewage, *Odor, Domestic wastes, Legislation, Sewage disposal, Sewage effluents, Ditches, Recreation, Recreation facilities, Condemnation, Closed conduits, Disposal, Open channels, Remedies, Regulation, Legal aspects.
Identifiers: Penalties (Criminal).

All sewers and ditches used for carrying raw sewage or effluent from land located near recreation areas in certain counties are required to be fully enclosed. If any such sewer or ditch emits offensive and unhealthy odors, it shall be considered a nuisance and condemned as such. The condemned sewers and ditches may not be used for carrying raw sewage and effluent until all causes of the odors are completely eliminated. Any person found guilty of using any open ditch or sewer after it has been condemned shall be guilty of maintaining a nuisance. A maximum penalty of $1,000 and one year's imprisonment is provided. (Schram-Florida)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

DETERMINATION OF OPTIMAL FLOOD PROTECTION LEVELS WITH SMALL EXCEEDANCE PROBABILITIES,
Carnegie-Mellon Univ., Pittsburgh, Pa.
Richard M. Shane, and Donald P. Gaver.
Water Resources Research, Vol 5, No 6, p 1223-1228, Dec 1969. 6 p, 1 fig, 2 tab, 4 ref, append.
NSF Grants GP-8824 and GK-1482.

Descriptors: *Probability, *Flooding, *Frequency analysis, *Statistical methods, Regression analysis, Markov processes, Forecasting, Economics, Cost-benefit analysis, Statistical models, Correlation analysis.
Identifiers: *Flood frequencies.

A technique for selecting flood protection levels that exceed mean flood intensities by a large amount is based on a probability model derived from the assumption that base flow floods occur at random with exponentially distributed magnitudes. It is a parametric approach involving the estimation of two statistical parameters by the method of maximum likelihood. The sensitivity of the results to errors made in choosing the correct flood intensity distribution is examined by computing the loss when the flood intensities are log normally distributed. This loss is shown to be small over a wide range of parameter values likely to be encountered. Through the use of a quadratic loss function it is shown that the expected loss is inversely proportional to the length of record. Furthermore if the existing level of protection exceeds the mean peak flood intensity by a large amount, then parameter estimation losses can be quite large, even when a record of considerable length is available. The quadratic loss function also demonstrates that the loss is due primarily to errors in estimating the expected flood intensity. (Knapp-USGS)

AN EXAMINATION OF LINEAR HOMOGENEITY OF TRADE AND PRODUCTION FUNCTIONS IN COUNTY LEONTIEF MATRICES,
Pennsylvania State Univ., University Park.
Wesley H. Long.
Journal of Regional Science, Vol 9, No 1, p 47-67, Apr 1969. 21 p, 1 fig, 11 tab, 10 ref.

Descriptors: *Leontief models, Regional analysis, Homogeneity, Forecasting, Regression analysis, Input-output analysis, Economics.
Identifiers: *Linear homogeneity, *Trade, *Production function, *Leontief matrices, *Leontief's assumptions, Leontief functions, Leontief coefficients, Regional economics, Bias, Impact analysis.

Leontief's simplifying assumptions about the nature of production functions have allowed the power of linear algebra to be applied to the empirical solution of various models concerning interdependence among producers in an economy. In regional economics the Leontief assumptions have been applied to trade functions, where matrices describe trade relations among industries in a region, as well as to production functions, where matrices describe technological relations among industries. In either case the inverse of the coefficient matrix is used to make forecasts and impact analyses. These projections are predicated on the linearity and homogeneity of the production or trade function. The purpose of this paper is to examine these two simplifying assumptions by means of a regression analysis of cross-section data for a limited number of expenditures made by various sectors of a county economy. Tests of these assumptions have been made before and the justification for the present investigation is that it approaches the question differently and that it is concerned with a small region. Input-output analysis has been used fairly extensively in the water area. Recently studies have used this method to study water resources in the Western States and this study may provide the basis for an input-output water study for small geographic areas. (Loeb-Rutgers)

A GENERALIZATION OF THE CES PRODUCTION FUNCTION,
Oklahoma State Univ., Stillwater; and Iowa State Univ., Ames.
Yao-chi Lu, and Lehman B. Fletcher.
The Review of Economics and Statistics, Vol 50, No 4, p 449-452, Nov 1968. 4 p, 7 ref.

Descriptors: *Return to scale.
Identifiers: *CES production function, *VES production function, Elasticity of substitution, Marginal rate of substitution, Cobb-Douglas function.

The main weakness of the CES (constant elasticity of substitution) production function seems to be the empirical starting point. The derivation of the CES function is based on the assumption that the partial regression coefficient of log K/L is equal to zero. The authors feel that the above assumption is not realistic. This position is supported by their empirical findings. The purposes of this paper are: (1) to derive a more general form of the production function that does not depend upon the above assumption and which has the property of a variable elasticity of substitution, (2) to examine the elasticity of substitution of the new function, and (3) to present some evidence of the desirability of using the new function. Production functions can be applied to water supply analysis and the CES and VES (variable elasticity of substitution) functions may prove to be useful specifications of water production and supply functions. LOCATIONAL EQUILIBRIA,
Michigan Univ., Ann Arbor.
Edward E. Leamer.
Journal of Regional Science, Vol 8, No 2, 229-242, Winter 1968. 14 p, 14 fig, 6 ref.

Descriptors: Demand, Supply, Costs.
Identifiers: *Locational equilibria, Transportation cost function, Objective function, Demand densities, Trade, Market areas, Cournot model.

A fixed demand distributed throughout a plane may be met by the establishment of supply points or sources at various locations. Innumerable situations of this type occur and examples are immediate: airports, warehouses, post offices, etc. This paper presents source location optima for two families of demand densities. In addition, the author develops a simple mathematical formula relating the transport cost to the number of optimally located sources. Extensions and applications of the formula are discussed. The author shows that economic borders which fracture an otherwise uniformly continuous demand do not cause enough distortion in the optimal allocation of sources to induce significant increases in transport costs. As such, this article might be helpful in locating water reservoirs with respect to actual or projected demand densities and conditions. (Loeb-Rutgers)

AN EXTENSION OF THE GENERALIZED WEBER PROBLEM,
Washington Univ., St Louis, Mo.
Leon Cooper.
Journal of Regional Science, Vol 8, No 2, p 181-197, Winter 1968. 17 p, 1 fig, 2 tab, 7 ref, 1 append.

Descriptors: Costs, Distance, Digital computers.
Identifiers: *Generalized Weber problem, Transport distance, Iteration, Local minima, Location studies.

Several papers have independently presented methods for solving the generalization of the Weber problem, i.e., finding a single point (origin or source) in two-dimensional Euclidean space which is the minimum transport distance and/or cost point for any number of destination points. A mathematical statement of the generalization of the simple Weber problem is given. In this paper the author is concerned with a modification of the problem to find the point (x,y) such that the sum of distances or costs proportioned to distances are a minimum. The modification concerns the fact that in realistic situations the cost of shipment or servicing may not be simply proportional to distance (with weights). In some situations it would be more appropriate to assume that the costs were proportional to distance raised to some power. This greater flexibility in realistically and accurately fitting cost data. Such an analysis might be applicable in the water area particularly in situations of designing efficient water pipe line services. (Loeb-Rutgers)

OPERATIONS RESEARCH,
Harvard Univ., Cambridge, Mass.
Robert Dorfman.
Surveys of Economic Theory, Resource Allocation, Vol III, p 29-74, Macmillan, London, England, 1966. 46 p, 5 tab, 40 ref.

Descriptors: *Operations research, Mathematical models, Linear programming, Systems analysis, Probability, Model studies.
Identifiers: Measure of merit, Information theory, Inventory models, Objective function.

The operations analyst, in contrast with the conventional business analyst, has a predilection for formulating his problems by means of formal mathematical models. By a model, the author means a symbolic description of a phenomenon in which its observable characteristics are deducted from simple explanatory first principles by manipulating symbols in accordance with the laws of some formal logic. Such analysts have a preference for symbolic, as opposed to verbal, modes of expression and reasoning. Operations research is not a descriptive science but a prescriptive one. A major part of the task of the operations analyst is to construct a 'measure of merit' for the operation he studies to accompany his formal description of it. The logical precision of the model enforces corresponding precision in expressing the objectives that the operation is intended to attain. The author discusses a number of aspects of the problem of model formulation. Then the problems of determining measures of merit or objective functions are examined. Operations research can be used advantageously in many sectors of the water area, examples would be water pricing, simulation models and demand forecasting. This article provides a general reference for the water researcher interested in using operations research methods. (See W70-03990). (Loeb-Rutgers)

LINEAR THEORY,
All Souls Coll., Oxford (England).
J. R. Hicks.
Surveys of Economic Theory, Resource Allocation, Vol III, p 75-113, Macmillan, London, England, 1966. 39 p, 4 fig.

Descriptors: Linear programming, Input-output analysis, Mathematical studies, Equations.
Identifiers: *Linear theory, Activity analysis, Game theory, Duality Theorem, Convexity.

The subject which the author discusses in this article concerns the group of techniques of linear programming, activity analysis, input-output, and theory of games. It is apparent, from the most casual inspection of these topics, that they are closely related. Further examination shows that they can be set around a recognizable core, which may be regarded as a restatement of a central part of conventional economic theory. It is the object of the author to isolate this core and to consider what there is that the economist, who has no intention of becoming a practitioner of the techniques, may learn from it. The phenomenon which is examined is the application to economics of a new kind of mathematics. This article has relevance to the water area in view of extensive use of these mathematical techniques in this sector. (See W70-03990). (Loeb-Rutgers)

6B. Evaluation Process

RELATIVE IMPORTANCE OF VARIABLES IN WATER RESOURCES PLANNING,
Geological Survey, Washington, D.C.; and Resources for the Future, Inc., Washington, D.C.
I. C. James, II, B. T. Bower, and N. C. Matalas.
Water Resources Research, Vol 5, No 6, p 1165-1173, Dec 1969. 9 p, 2 fig, 4 tab, 13 ref.

Descriptors: *Planning, *Water resources development, *Statistical models, Statistical methods, Non-structural alternatives, Simulation analysis, Forecasting, Water quality, Estuaries, Model studies, Mathematical models, Markov processes, Probability, Economics, Legal aspects, Social aspects, Political aspects, Synthetic hydrology, Water pollution, Water supply.
Identifiers: *Sensitivity analysis, *Potomac River Estuary.

Four variables involved in the water resources planning decision characterized by hydrology, modeling of dissolved oxygen behavior in an estuary, projection of economic development, and water quality objective, were tested for sensitivity in the evaluation of a water resources system's performance. The results were obtained assuming a 25% range in economic projection, 1 mg/liter range in the dissolved oxygen objective, two separately developed models of estuarial dissolved oxygen behavior, and 50- and 10-year sequences of hydrologic data. The results of simulations of system operation with the different values of the planning variables were subjected to a four-way analysis of variance to partition the variance attributable to each planning variable. For the system under consideration, the relative importance of the variables in descending order is: (1) economic development projection, (2) water quality objective, (3) dissolved oxygen modeling, and (4) hydrology. Data collections, Desalination, Planning, Management.
Identifiers: Socio-economic aspects.

The purpose of this annotated bibliography is to ease the task of those desiring to review the literature pertaining to the economic aspects of water. The bibliography includes, but is not limited to, the literature in the following areas of interest: (1) The supply of and demand for water of various qualities including the competitive uses for industry, domestic, and recreation; (2) methods and applications of cost/benefit analysis, including those involving multiple-purpose water projects; (3) economic impact of water resources and water development projects; and (4) methods of determining economic values of sport fisheries, wildlife, and other aquatic outdoor recreation resources, as well as material on the social values of water-based outdoor recreation. The abstracts prepared for this bibliography are brief, noncritical, and indicative in nature. Each abstract has been given an identifying number, and has been indexed not only in terms of the central theme of the article, but also in terms of the material which is presented in support of the central theme. Following each abstract, all of the index terms deemed relevant to the article have been listed. In the subject index for this publication, two objectives were considered: (1) a comprehensive index for the immediate users, and (2) a deeper index for possible future inclusion in a computerized coordinate index system. A COMPARATIVE ANALYSIS OF THE NET PRESENT VALUE AND THE BENEFIT-COST RATIO AS MEASURES OF THE ECONOMIC DESIRABILITY OF INVESTMENTS,
British Columbia Univ., Vancouver.
Bernhard Schwab, and Peter Lusztig.
Journal of Finance, Vol 24, No 3, p 507-516, June 1969. 10 p, 3 fig, 10 ref.

Descriptors: *Cost-benefit ratio, *Investment, Constraints, Risks.
Identifiers: *Netted present value, *Present value, Economic desirability, Aggregate benefit-cost ratio, Netted benefit-cost ratio, Utility analysis.

Recent contributors in managerial finance have largely been concerned with the more challenging issues of valuation and capital structure. As a consequence, several controversial but less provoking issues remain shelved and unresolved. This paper is essentially directed at one such issue, the merits of alternative criteria for measuring the economic desirability of investments (both individual investment propositions and aggregate investment portfolios). The particular issue is the comparison of the net present value with various benefit-cost ratios. While these measures are based on the same fundamental concept, recognizing the time value of money, and are, therefore, related to each other, they are different enough to yield contradictory results in a number of situations. It is the purpose of this article to analyze systematically all these various measures of economic desirability, defining the conditions under which they yield equivalent results and the conditions under which their results are contradictory, and as a consequence, to determine the validity of their application to the economic evaluation of investments. Such an analysis should lend itself to the evaluation of investments in the water area. (Loeb-Rutgers)
W70-03825

COPING WITH UNCERTAINTY IN THE MAKE OR BUY DECISION,
Marquette Univ., Milwaukee, Wis.
Lloyd D. Doney.
Management Accounting, Vol 50, No 2, p 31-34, Oct 1968. 4 p, 7 tab.

Descriptors: *Risks, *Decision making, Probability, Fixed costs, Costs, Industrial production.
Identifiers: *Make or buy decision, Decision cost, Probability weighing, Decision matrix.

The make or buy decision analysis is usually presented in an oversimplified manner in order that full attention may be given to the significant fact that decision-making most often requires a collection of figures that differ from those that are appropriate for purposes of income determination and inventory valuation. In pursuing this line of emphasis, the circumstances of the make or buy decision under consideration are usually void of any consideration of the uncertainty that typically surrounds the decision-making process in real situations. The purpose of this investigation is to add an uncertainty dimension to the typical make or buy decision analysis. A hypothetical example is given so as to demonstrate this extension of the make or buy decision analysis. This analysis might be applicable to the water area where uncertainty in both demand, supply and investment decisions is a prominent factor. (Loeb-Rutgers)
W70-03826

INVESTMENT RETURNS BEFORE AND AFTER TAX,
Michigan Univ., Ann Arbor.
Harry Benford.
The Engineering Economist, Vol 10, No 4, p 1-16, Summer 1965. 16 p.

Descriptors: *Profits, *Taxes, *Costs, Investment, Operating costs, Interest rate, Financing, Loans, Depreciation, Economics, Cost repayment, Capital.
Identifiers: *Corporations, *Rate of return, Disposal value, Equity capital, Fast write-off.

This article attempts to explain the influence of the corporate profits tax on levels of profitability and the annual cost of capital. This topic should be of interest to the water resource planner due to the corporate structure of many water utilities and the effects of the tax as felt throughout the entire economy, (i.e. through changes in the price of capital). The author considers a simple case where the depreciation period for taxes equals the life of the investment, the investment is all equity capital and there is a negligible disposal value. He then moves on to the case where the depreciation period for taxes may be shorter than the probable useful life of the investment and the investment is raised throughout a bank loan. The last case studied is that where the depreciation period exceeds the loan period. The author concludes with some numerical examples to illustrate the concepts developed. (Murphy-Rutgers)

MAXIMUM PROSPECTIVE VALUE CRITERION,
Stanford Univ., Calif.
R. V. Oakford, and G. J. Theusen.
Engineering Economist, Vol 13, No 3, p 141-164, Spring 1968. 24 p, 9 tab, 10 ref.

Descriptors: *Investment, *Engineering, *Economics, *Growth rate, *Costs, Budgeting, Decision making, Computers, Discount rate, Economic evaluation, Marginal utility, Dividends, Value, Time, Optimization, Capital, Data gathering revenue.
Identifiers: *Prospective value, *Opportunity costs, Capital budget, Expectations, Cash flows, Dispursements, Receipts, Incomplete information.

This article analyzes the logic of the capital budget decision in two different situations. In both cases the decision-maker has full knowledge of his current investment opportunities. In one case he also knows his future investment opportunities, while in the other he only knows his expectations about these future opportunities. The article presents a discussion of the capital growth (or discount) rate that should be used in determining whether a marginal increment of investment should be accepted or rejected. The discussion results in the presentation of a capital-budgeting decision criterion called the Maximum Prospective Value Criterion. This criterion is designed to select the investments that have maximum prospective value to the decision-maker, given the information he has at hand. This goal is a general one in public investment decisions including water resource projects. Accordingly, researchers in water investment decision analysis will be interested in this article. (Murphy-Rutgers)
W70-03828

ON SUBSIDIES TO SPEED THE RATE AT WHICH TECHNOLOGIES ARE DEVELOPED,
Office of the Secretary of the Treasury, Washington, D.C.
Laurance C. Rosenberg.
Engineering Economist, Vol 12, No 1, p 1-21, Fall 1966. 21 p, 1 tab, 3 fig, 9 ref.

Descriptors: *Government, *Research and development, *Water desalting, *Technology, Profits, Budgeting, Investment, Financing, Optimization, Correlation, Costs, Prices, Capital cost, Loans, Interest rate.
Identifiers: *Subsidies, *Isotechnology curves, Investment criteria, Social optimum, Rate of return.

The direct financing, by the U S Government, of the technology of water-desalting devices is largely responsible for its rapid development. This and other cases mentioned are areas where government sponsors R and D almost completely and the technology is almost wholly utilized by the private sector. This paper explores an R and D investment decision model with the aim of determining the impact on its variables of some possible subsidy methods that might be used to induce an increased rate of development of specific technologies by private industry. The author constructs a profit-maximizing model for R and D investments, using capital-budgeting theory as its basis. Its implication for subsidy methods of the government are discussed and the impact of these methods, when investment criteria other than the profit maximizing model is used, are mentioned. The importance of government subsidies in water resource development should make this article useful to the water resources investigator. (Murphy-Rutgers)

IS RESOURCE ECONOMICS UNORTHODOX,
Resources for the Future, Inc., Washington, D.C.
Orris C. Herfindahl.
Journal of Soil and Water Conservation, Vol 24, No 1, p 10-11, Jan-Feb 1969. 2 p.

Descriptors: Economics, Political aspects, Natural resources, Resource allocation, Demand, Cost-benefit analysis, Decision making.
Identifiers: *Resource economics.

The author comments on a paper by Sargent in the same journal and argues that the relevant economic and political theory is the same for all applied fields of economies, of which natural resources may be viewed as one. The author contends that the market is the prime resource allocating system for the economy including the natural resource area. However, the fact that the market will not solve all problems is admitted. Often, the pursuit of self-interest will yield less than desirable results. However, it would be wrong to blame the market system for these misallocations. Contrary to Sargent's assertion, demand can be studied and estimated and may possibly suggest procedures that will enable us to reap some of the results generated by market forces. The 'conventional' economist working on resource problems may sometimes err because he does not sufficiently understand the physical and biological relationships involved and because he is not accustomed to working with problems in which benefits and costs external to the decision making unit occupy so prominent a place. The remedy is

not to abandon conventional economics but to learn enough about the problem at hand to apply it. This problem is apparent in the water area where conventional economic theory must be supplemented in many instances by sociological and biological data to improve water resource allocation. (Loeb-Rutgers)

ON INDEPENDENCE POSTULATES CONCERNING CHOICE,
Philippines Univ., Manila.
Jose Encarnacion.
International Economic Review, Vol 10, No 2, p 134-140, June 1969. 7 p, 2 fig, 11 ref.

Descriptors: *Consumption, *Economic evaluation, *Uncertainty, Maximinzation, Probability, Mathematical studies, Decision making, Profits, Prices, Value, Marginal utility.
Identifiers: *Preference ordering, *Independence, *Utility function, Sure-thing principle, Strong independence axiom, Impossibility theorem, Lexicographic ordering.

This paper argues that the independence postulates assumed by Savage, Koopmans, and Arrow are not valid when choice is essentially multidimensional. Specifically, these postulates are violated by certain lexicographic preference orderings which are themselves consistent. The author shows that the 'sure-thing' principle used by Savage presupposes that choice is unidimensional, i.e., representable by a real-valued utility function. Koopmans employs a postulate similar to Savage's but the author shows that his conclusion regarding zones of impatience is not the only possible conclusion and the more correct one would be that the utility function is not real-valued. The binary choice condition used by Arrow is wrong in restricting group choice as a function only of individual choices among the alternatives themselves. Due to the importance of understanding consumer behavior as it applies to water demands this article should be of use to the water researcher interested in the basic theoretical foundations of demand study. (Murphy-Rutgers)

GENERALIZED PRODUCTION FUNCTIONS,
Chicago Univ., Ill.; and State Univ. of New York, Buffalo.
A. Zellner, and N. S. Revankar.
The Review of Economic Studies, Vol 36, No 106, p 241-250, Apr 1969. 10 p, 2 tab, 10 ref, 1 append.

Descriptors: Average costs, Return to scale.
Identifiers: *Generalized production function, Elasticity of substitution, Output, Average cost curves, Labor's share, Maximum likelihood estimate.

In this paper generalized production functions (GPF's) are introduced where the generalization referring to what is assumed about not only the elasticity of substitution but also the behavior of the returns to scale. That is, given a neo-classical production function with a given elasticity of substitution (constant or variable), it is shown how this function can be transformed to yield a neo-classical GPF with the same elasticity of substitution and with the returns to scale variable and satisfying a preassigned relationship to the output level. For example, a GPF may have a constant elasticity of substitution and returns to scale which diminish in a preassigned fashion with the level of output. This contrasts with many current production functions used in applied studies which assume the same returns to scale at all levels of output. Since returns to scale may be different at different scales of operation, GPF may be useful in analyzing data relating to production. Production functions are often estimated in the water research area and as such, the GPF analysis may prove to be applicable to water problems. (Loeb-Rutgers)

A COST MODEL FOR COASTAL SHIPPING, A NORWEGIAN EXAMPLE,
Institute of Transport Economy, Oslo (Norway).
B. Foss.
Journal of Transport Economics and Policy, Vol 3, No 2, p 195-221, May 1969. 27 p, 4 fig, 5 tab.

Descriptors: Ships, Costs, Competition, Return, Fuels, Oil, Maintenance, Claims, Insurance, Capital costs, Indirect costs, Investment.
Identifiers: *Cost model, *Coastal shipping, Air service, Road service, Passenger ships, Cargo ships, Cargo handling costs, Port dues.

The sea has always been a natural route for communications for Norway. However, the importance of sea transport is gradually being eroded. Extensive road building in the coastal districts is enabling bus service to replace the shorter shipping routes, while the longer ones are threatened by competition from the air. Coastal shipping includes scheduled services, ferries and tramp traders. This article analyzes the economics of the scheduled shipping services and develops cost-performance relationships for both construction and operating costs of modern ships. It also considers how far sea transport can hold its own against road and air competition. This discussion will be relevant to water areas such as the Great Lakes as well as the coastal United States. (Loeb-Rutgers)

THE IMPACT OF INDUSTRIAL LINKAGES ON GEOGRAPHIC ASSOCIATION,
North Carolina Univ., Chapel Hill.
Charles E. Richter.
Journal of Regional Science, Vol 9, No 1, p 19-28, Apr 1969. 10 p, 1 tab, 17 ref.

Descriptors: Employment, Correlation analysis, Statistical methods.
Identifiers: *Industrial linkages, *Geographical association, External economics, Industrial location, Coefficient of correlation.

The external economies associated with industrial linkages have frequently been cited as possible causes of economic agglomeration and the uneven geographic distribution of economic activities. It is often asserted that industries locate near their principal markets of sources of materials because high initial transport rates usually discourage intermediate locations. Also advantages in communications encourage important buyers and sellers to locate in geographic proximity. Nevertheless, because of the lack of data and the difficulty of separating out the linkage effect on industrial location, no studies have effectively measured the importance that industrial linkages may have on geographic association between industries. The purpose of this paper is twofold: (1) a new and better measure of geographic association is developed, and (2) the measurement is used to evaluate the importance of linkages on the locations of manufacturing activities. An extension of the topic of this paper might provide insights in the problem of industrial location and its relation to water supply and conditions. (Loeb-Rutgers)

THE DYNAMIC PROGRAMMING APPROACH TO WATER-RESOURCES DEVELOPMENT,
California Univ., Los Angeles.
Warren A. Hall, and Nathan Buras.
Journal of Geophysical Research, Vol 66, No 2, p 517-520, Feb 1961. 4 p, 11 ref.

Descriptors: *Economics, *Optimization, *Water resource development, *Dynamic programming, Benefits, Water resource allocation, Mathematical studies, Rivers, Multipurpose projects, River development, Water supply, Prices, Reservoirs, Computers, Irrigation, Flood control.
Identifiers: *Economic returns, Viable alternatives.

The author blames the present poor state of affairs in river development to the inability of those responsible to consider the large numbers of alternatives with precision. He proposes dynamic programming as a way in which calculations can be reduced to a form which is readily handled by a computer in a relatively short time and one in which optimum policy is computed for every possible level of resource development. In this paper dynamic programming is applied to the optimizing process to permit determination of the 'optimum' policy over a very broad range of alternatives. The solution arrived at provides the optimum allocation of the water resource. The author states that this method may be used on all tractable portions of the individual problems in order to increase the economic returns. (Murphy-Rutgers)
W70-03836

SOCIOECONOMIC STATUS: A RE-EXAMINATION OF ITS DIMENSIONS,
Columbia Univ., New York.
Jerome B. Gordon.
The Journal of Human Resources, Vol 4, No 3, p 343-359, Summer 1969. 17 p, 7 tab.

Descriptors: Regression analysis, Welfare, Costs, Performance, Age, Income, Employment, Labor supply.
Identifiers: *Socioeconomic status, Cobb-Douglas production function, Social welfare, Intensity of skill preparation, Educational attainment, Census SES score, Duncan SES score, GED/SVP code.

It is the author's contention that social scientists are going to be hard put to develop adequate measures of effectiveness or criteria for choosing amongst alternative programs dealing with maximizing social welfare and well-being, or minimizing the costs associated with their delivery. Criteria of choice or measures of effectiveness must be transformations of measures of performance, not the measures of performance themselves. Although one cannot obtain ideal measures of effectiveness, one is not prevented from developing and applying approximate measures. The purpose of this paper is to present some empirical work in the direction of devising a new index of socioeconomic status and its impact on weighting the components of such an index of socioeconomic status. Multiple regression analysis is used to develop a Cobb-Douglas production function for estimating socioeconomic status. Socioeconomic variables have proven to be significant in studies pertaining to the demand for outdoor recreation facilities and other water uses. As such, this article might prove helpful in further studies pertaining to this section of water analysis. (Loeb-Rutgers)
W70-03837

THE OPTIMALITY OF LOCAL SUBSIDIES IN REGIONAL DEVELOPMENT PROGRAMS,
West Virginia Univ., Morgantown.
Carl W. Hale.
The Quarterly Review of Economics and Business, Vol 9, No 3, p 35-50, Autumn 1969. 16 p.

Descriptors: *Optimization, *Regional analysis, *Economics, Interest rate, Taxes, Marginal cost, Financing, Capital investment, Government supports.
Identifiers: *Local subsidies, Unemployment, Minimum wage, Subsidization, Rate of discount.

The concept of local subsidies to private industry is examined. The author wishes to examine three assumptions: (1) that such subsidies act as a foil to institutional impediments to market adjustments; (2) that the subsidies actually attract new firms or branch plants to the community offering; and (3) that no national or regional repercussions of a serious nature result from such practices. The applicability of benefit-cost analysis in attempting to measure the rate of return of such subsidies, is also examined. The use of regional economic analysis in water development studies along with the applicability of the benefit-cost techniques to water resources make this article of interest to the water resource planner. The author shows that optimal

decisions made with regard to regional development programs cannot be made at the community level through the unrestricted use of local subsidies. (Murphy-Rutgers)

PRODUCTION, CONSUMPTION, AND EXTERNALITIES,
Resources for the Future, Inc., Washington, D.C.
R. V. Ayres, and A. V. Kneese.
American Economic Review, Vol LIX, No 3, p 282-297, June 1969. 16 p, 1 fig, 1 tab, 31 ref.

Descriptors: *Economic analysis, *Industrial production, Equilibrium, Pollution, Input-output analysis, Inventory, Natural resources, Water resource development, Taxes, Investment, Transportation, Sewage disposal, River flow, Wastes, Streams, Public health.
Identifiers: *Water residuals, *Production, *Consumption, *Welfare economics, *Externalities.

This article proposes that the externalities associated with the disposal of residuals resulting from the consumption and production processes have an economic significance which increases with economic development. Consequently, the ability of the ambient environment to receive and assimilate them in an important natural resource of increasing value. Such externalities cannot be properly dealt with by isolating environmental media such as water. Restrictions such as taxes are essential in an environmental quality management program, but must be used in conjunction with public investment programs, transportation systems, sewage disposal and river flow regulations. To attain this end, this article presents a model designed to develop improved measures of external costs and systematic methods of forecasting emissions of external-cost producing residuals, the technical and economic tradeoffs between them and the effects of the recycle on environmental quality. Due to its direct application to water this model has important implications for water research methods dealing with evaluations of water pollution control programs. (Murphy-Rutgers)
W70-03843

INSTITUTIONAL FACTORS AFFECTING LAND AND WATER DEVELOPMENT, LOWER RIO GRANDE VALLEY, TEXAS,
Texas A and M Univ., College Station.
Warren L. Trock.
Water Resources Research, Vol 5, No 6, p 1364-1366, Dec 1969. 3 p, 1 ref. OWRR Project No B-025-TEX.

Descriptors: *Water resources development, *Institutional constraints, *Water law, *Water rights, *Rio Grande, Land management, Water management (Applied), Political constraints.
Identifiers: Lower Rio Grande Valley (Tex).

Among the many institutional factors that complicate land and water development in the lower Rio Grande valley are (1) uncertainties in water rights, (2) a proliferation of special districts, (3) inappropriate water management policies among districts, and (4) numerous governmental entities involved in planning and administering water resources. It is recommended that the people of the valley urge and facilitate an early adjudication of rights. Improvements in irrigation and drainage could be achieved by reorganizing the special districts. A master district for the three-county are may be a logical alternative to the many districts that now exist. Rehabilitation of irrigation systems, including installation of water meters, will contribute to the management of water supplies. (Knapp-USGS)

STRATEGY FOR MICHIGAN WATER RESOURCES MANAGEMENT: A SYSTEMS APPROACH,
Technology Planning Center, Inc., Ann Arbor, Mich.
James C. Kellogg.
Technology Planning Center, Inc, Ann Arbor, Mich, 1966. 87 p, 7 fig, 10 ref, 3 append.

Descriptors: *Water resources development, *Systems analysis, *Models, *Michigan, *Decision making, *Water demand, Water supply, Interstate, Technology, Programs, Costs, Benefits.

The study presented a strategy for optimum management of Michigan State Water Management. Using a systems analysis approach the strategy was developed as an outline for a Comprehensive Master Plan (CMP). The outline was divided into four steps: (a) the roles and responsibilities of Michigan State in water management were defined as either regional, multi-state, inter-regional, interstate or intrastate; (b) elements of water resource management, i.e., demands for water resources, water resource supply, technology that could be applied to the water resources problem, and the management capabilities available, were defined; (c) a Comprehensive Master Plan model was established for Michigan water resource objectives; and (d) alternative programs were presented, providing as much information as possible on their costs and benefits to those who make state water resource decisions. BIOSTIMULATION AND TOXICITY CRITERIA AND APPLICATIONS IN DESIGN--PRESENT PRACTICE AND FUTURE POSSIBILITIES,
Engineering-Science, Inc., Oakland, Calif.
Philip N. Storrs.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 222-226.

Descriptors: *Eutrophication, *Toxicity, *Water quality, *Design criteria, *Planning, *Forecasting, Analytical techniques, Physiological ecology, Minnesota, Bioassays, Growth stages, California, Benthos, Nutrients, Agricultural wastes, Algae, Water pollution effects, Plankton, Municipal wastes, Industrial wastes, Fish.
Identifiers: *Biostimulation, *Design applications, *Water quality criteria, Growth response, National Water Quality Lab, Duluth (Minn), University of California, Berkeley (Calif), Community structure, San Francisco Bay-Delta Program, Relative toxicity, Species diversity indices, San Francisco Bay, Environmental stresses, Relative biostimulant content, Median lethal tolerance limits.

Problems of water quality management are becoming increasingly complex due to constantly changing criteria. Numbers of criteria increase as does possibility of expressing them quantitatively. The problem is also complicated by increasing diversity of water uses. Current research efforts in biotoxicity and biostimulation are directed toward understanding of mechanisms involved, and developing or improving control methods. That bioassays of toxicity suffer from defects is acknowledged and attempts to circumvent these deficiencies have included assessment of various sublethal organismic responses, development of longer tests over total life history of various organisms, and determination of effects on structure of biological communities. Recent studies have introduced the concept of Relative Toxicity (RT), defined as volume flow rate of a discharge divided by its 48-hour median lethal tolerance limit, developed by bioassays. Analogizing with studies of biotoxicity suggests a program of biostimulation study in specific receiving waters, which involves identification of potential biostimulant sources; bioassays of growth of indigenous algae under conditions simulating environment; development of parameter, Relative Biostimulant Content (RBC), analogous to RT; determining in situ growth and biomass of algal populations; sampling and calculating RBC of receiving waters; determining relationship between RBC and population changes. THE WATERSHED AS AN ENTITY FOR PLANNING,
Tennessee Valley Authority, Knoxville. Div. of Agricultural Relations.
Fletcher E. Riggs.
In: Economics of Watershed Planning, p 59-67, Iowa State University Press, Ames, 1961. 9 p, 1 fig.

Descriptors: *Watersheds, *Planning, Water resources, Tennessee River, River basins, Drainage, Benefits, Costs, Flood control.
Identifiers: *Watershed planning, Regional economic development, Physical characteristic, Watershed problems.

Watershed planning has been primarily concerned with narrow purposes of land and water resources development. In a few instances these objectives have been broader. The Tennessee River watershed has provided the geographic context for a broad program of regional economic development. However, the focus in this paper is on the usefulness of the watershed in planning for the development of land and water resources. The author discusses the physical characteristics of the watershed, watershed problems, and the entity for land and water resources planning. The author concludes that the form of organization for basin-wide planning and for unification of activities in the watershed should be of the river basin type. (See Vol 2, No 14, Field 6B, entry W69-05718). (Loeb-Rutgers)
W70-03987

COMMENT ON, 'THE WATERSHED AS AN ENTITY FOR PLANNING',
Kentucky Univ., Lexington.
John C. Redman.
In: Economics of Watershed Planning, p 68-69, Iowa State University Press, Ames, 1961. 2 p.

Descriptors: *Watersheds, *Planning, Flood control, Costs, Benefits, Size.
Identifiers: Optimum size, Public Law 566.

The question of determining the optimum size watershed is brought up by the author. The author further suggests the examination of the hypothesis that as a watershed becomes larger, it loses (or gains) some claim as the appropriate entity for planning. As watersheds increase in size, social, political, and economic institutions may become more important. If so, more concern should be expressed for other entities, such as a trade or market area. Watershed plans must be coordinated with market plans; often they must be planned simultaneously. Such an arrangement brings together a

group, with similar backgrounds and problems, who have common goals. The whole community should understand the proposal if the project is to be effective. The author suggests that Riggs should have mentioned the influence of purpose and the level of desired flood protection. Like Riggs, the author favors a river basin type of development but only under special conditions. Because of organizational problems, the author is inclined to think that the small watershed has more to contribute than Riggs had indicated. (See Vol 2, No 14, Field 6B, entry W69-05718). (Loeb-Rutgers)
W70-03988

COMMENT ON, 'MESHING WATERSHED DEVELOPMENT WITH RIVER BASIN DEVELOPMENT',
Michigan Univ., Ann Arbor.
Lyle E. Craine.
Economics of Watershed Planning, p 84-86, Iowa State University Press, Ames, 1961. 3 p.

Descriptors: *Watersheds, Planning, River basin, Cost-benefit analysis.
Identifiers: Guiding ideas, Waterservices, Water production planning, Meshing.

The author suggests several specific concepts which may provide guides in designing relationships between watershed development, river basin development, and planning. First, the integrity of the drainage basin as a development unit is inviolate only if the basin is viewed as a production facility for water services. Second, the problem is to determine the extent and methods of articulating water production planning with comprehensive planning, rather than to force one to absorb the other. Third, the extent and method of articulation will differ in different situations, and a major determinant will be the expressed need that motivates a drainage basin development. The author then postulates several types of situations. Fourth, the problem of meshing watershed and river basin development, like that of relating water development to comprehensive planning, also calls more for articulation than for integration. Fifth, the concepts of benefit-cost analysis must be extended beyond the calculus of efficiency. (See Vol 2, No 14, Field 6B, entry W67-05718). (Loeb-Rutgers)

SURVEYS OF ECONOMIC THEORY, RESOURCE ALLOCATION, VOLUME III.

London, England, Macmillan and Co Limited, 1966. 207 p.

Descriptors: *Resource allocation, Economics, Decision making, Operations research, Cost-benefit analysis.
Identifiers: *Economic theory, Linear theory, Household behavior.

The surveys printed within this volume have been produced by the American Economic Association and the Royal Economic Society. The purpose of such a volume is to make the literature pertaining to the advances in theories in economics more reasily available to students, research-workers and teachers. The topics included in this volume are: theories of decision making, operations research, linear theory, research on household behavior, and cost benefit analysis. These subjects have been found to be useful tools in the water area and this book provides the researcher with a useful summary and bibliography in the areas examined. (See also W70-03991 thru W70-03994). (Loeb-Rutgers)
W70-03990

THEORIES OF DECISION-MAKING IN ECONOMICS AND BEHAVIORAL SCIENCE,
Carnegie Inst. of Tech., Pittsburgh, Pa.
Herbert A. Simon.
Surveys of Economic Theory, Resource Allocation, Vol III, p 1-28, Macmillan, London, England, 1966. 28 p, 71 ref.

Descriptors: *Decision making, *Economics, *Psychological aspects, Behavior, Probability, Computers, Risks.
Identifiers: Behavioral science, Utility, Empirical studies, Normative applications, Binary choice experiment, Probabilistic preferences, Satisfying, Maximizing, Business behavior, Game theory, Bargaining, Expectations.

The role of psychology in the realm of economics is discussed. As the complexity of man's environment increases we need to know more and more about the mechanisms and processes that economic man uses to relate himself to that environment and achieve his goals. How close we wish to interweave economics with psychology depends on the range of questions we wish to answer and our assessment of how far we may trust the assumptions of static equilibrium as approximations. In both the theory of utility and its application to choice under uncertainty (as well as in consumer saving and spending) and in the macroeconomic sector (where one attempts to understand the process of making business decisions) notions of adaptive and satisfying behavior are challenging the classical picture of the maximizing entrepreneurs. Psychologists and economists have been applying a wide variety of approaches to the study of the formation of expectations. The author suggests that as economics finds it more and more necessary to understand and explain disequilibrium as well as equilibrium, it will find an increasing use for the digital computer for communication with psychology and sociology. The ideas of expectations and uncertainty play an important role in water demand and investment decisions. This article is relevant to the water area by reviewing the multidiscipline activity in areas traditionally considered economic in nature. (See W70-03990) (Loeb-Rutgers)
W70-03991

RESEARCH ON HOUSEHOLD BEHAVIOR,
Illinois Univ., Urbana.
Robert Ferber.
Surveys of Economic Theory, Resource Allocation, Vol III, p 114-154, Macmillan, London, England, 1966. 41 p, 170 ref.

Descriptors: Income analysis, Economics, Income, Expenditures, Decision making.
Identifiers: *Household behavior, Spending, Saving, Absolute income hypothesis, Relative income hypothesis, Socioeconomic characteristic, Expectations, Asset holdings.

The purpose of this paper is to survey the main empirical research of recent years on household behavior. Although the emphasis is on empirical work the principal theoretical developments are also reviewed. The article relates to consumer behavior at the microeconomic level. Although various parts of the discussion present the problems of aggregation and of macroeconomic relations, comprehensive coverage of these areas is outside the present article. Furthermore, the emphasis is on spending and saving behavior rather than on the income or other economic or non-economic behavior aspects of the consumer. At the same time this article transcends the usual boundaries of economics, to cover the growing importance of other disciplines in this area, particularly marketing, sociology and psychology. This article would be relevant to the water area for studies analyzing consumer demand for water. (See W70-03990). (Loeb-Rutgers)

WATER RESOURCES MANAGEMENT AND PUBLIC POLICY.
Washington Univ., Seattle.

Edited by Thomas H. Campbell and Robert O. Sylvester. Seattle, University of Washington Press, 1968. 253 p.

Descriptors: *Water quality, *Water resource development, Population, Pollution, Water supply, Economics, Waste disposal, Natural resources, Regional analysis, Fisheries, Management, Government, Water transfer, Cost-benefit analysis, Surface water, Economic efficiency, Economic feasibility, Legal aspects, Model studies, Hydrology, Aquifer, Lakes, Industrial wastes, Water law, Water resource planning.
Identifiers: Agricultural production, Land development, Public policy.

This book is an attempt to outline, for laymen, academicians, legislators, and the public, many of the relevant issues that should be considered in the management of water resources. It is based on papers prepared by the numerous contributors on the problems involved in water quality and water supply. Project analysis and agricultural demand for water in the West is discussed as well as the development of surface waters of California's Central Valley; using benefits and economic efficiency as the yardstick. The concept of benefit-cost is then examined in detail. Several papers emphasize the need for research and tell of some results on the Columbia River and the Pullman-Moscow aquifer. The methodology of establishing water-quality standards is examined, the economics of the problem discussed and an empirical example is provided. The techniques of receiving-water monitoring are presented, along with the industrial views about pollution. (See also W70-03996 thru W70-04000). (Murphy-Rutgers)

THE ECONOMICS OF AGRICULTURAL WATER USE,
Washington Univ., Seattle.
Gardner Brown.
Water Resources Management and Public Policy, Seattle, University of Washington Press, p 30-43, 1968. 14 p, 15 ref.

Descriptors: *Irrigation, Economic analysis, *Optimization, Cost-benefit analysis, Pricing, Government, Demand, Water supply, Water transfer, Economic efficiency, Bonds, Government supports, Social aspects, Water law, Marginal cost, Profits, Economic evaluation.
Identifiers: *Water agencies, *Externalities.

Water is another input or factor of production which the farmer, acting as the firm, employs to produce an output or combination of outputs. Some examples of the application of economic analysis are given, but the economists' assumptions underlying the analysis are not always fulfilled. An account of these complications and the steps which are being taken to overcome them is presented in the paper. The author then examines the policies of the Bureau of Reclamation as well as their consequences from the viewpoint of economic theory. A brief discription of the pricing policies associated with the California State Water Project is then provided and a comparison made between the practices of the Bureau of Reclamation and the California Department of Water Resources. The author concludes with an evaluation of the need for careful and imaginative economic analysis to estimate the magnitudes and distribution of costs and benefits associated with competing water policy choices. (See W70-03995) (Murphy-Rutgers)

BENEFIT-COST ANALYSIS: A CRITERION FOR SOCIAL INVESTMENT,
Stanford Univ., Calif.
Robert C. Lind.
Water Resources Management and Public Policy, Seattle, University of Washington Press, p 44-64, 1968. 21 p, 9 ref.

Descriptors: *Cost-benefit analysis, *Economic evaluation, *Social aspects, *Water resource development, Social welfare, Economic efficiency, Income, Regional analysis, Prices, Profits, Capital, Decision making, Discount rate, Economics, Irrigation, Government, Consumption, Interest rate, Flood control, Demand.
Identifiers: *Social investment, Time preference.

The general procedure of benefit-cost analysis is outlined and the rationale behind the procedure is explained. The desired measure of benefits and costs is discussed, as are the conditions under which market prices can be used in measuring benefits and costs. The relationship between the benefit-cost criterion and economic efficiency is brought out and the relation of the benefit-cost to profitability criterion is discussed. The special characteristics of social investment are then developed as are the difficulties that these characteristics create for the measurement of benefits and costs. The problem of incorporating risk in the decision rule is discussed in connection with the social rate of discount. The last section presents conditions under which benefit-cost analysis may be applied and points out several cases where market imperfections may complicate the problem of measuring costs and benefits. As an area of social investment where benefit-cost analysis is important, water resource development depends on the application of these principles and the author presents several examples of their application in the water area. (See W70-03995) (Murphy-Rutgers)
W70-03999

ECONOMIC ANALYSIS IN WATER QUALITY MANAGEMENT,
Washington Univ., Seattle.
James A. Crutchfield.
Water Resources Management and Public Policy, Seattle, University of Washington Press, p 129-138, 1968. 10 p.

Descriptors: *Waste disposal, *Economic analysis, *Cost minimization, Statistics, Water quality, Management, Economic efficiency, Demand, Water supply, Pollution, Costs, Benefits, Risks, Government, Decision making, Economic feasibility.
Identifiers: *Private costs, *Social costs, Uncertainty.

The principals underlying optimal and suboptimal systems of water-quality management is discussed. Examination is also conducted on the effects of the divergence of private and social costs and benefits in water use as well as the complications introduced by technological economies of scale in waste disposal. The contribution of economic analysis to water quality management in the handling of risk and uncertainty is discussed along with the problem of the extent to which the uses impaired by water-quality degradation are of the types most difficult to measure in economic terms. These difficulties, coupled with the wide areas of incomplete knowledge of highly variable physical parameters, suggest that water-quality management must in practice be limited to suboptimal systems designed to minimize aggregate waste-disposal costs subject to one or more constraints. WATER DEVELOPMENT FUND.

Mo Ann Stat secs 256.280 thru 256.370 (Supp 1970).

Descriptors: *Missouri, *Water resources development, *Water allocation (Policy), *Water management (Applied), Municipal water, Legal aspects, Legislation, Industrial water, Water storage, Water supply, Water resources, Reservoirs, Public utilities, Federal government, Administrative agencies, Water distribution (Applied), Water conservation, Water utilization, Project planning, Local governments.

The Missouri Water Development Fund is created for the purpose of financing the storage of the municipal and industrial water supply in public works projects and in works constructed with federal assistance. The Water Resources Board is responsible for proper distribution and allocation of the state-owned water supply. The Water Resources Board may sell or sublet water from storage. The Board may, with approval of the General Assembly, sell or sublet water from the municipal and industrial water supply to special-benefit users at cost. The Water Resources Board, acting on behalf of the state, must protect public interests in federal reservoirs. (Powell-Florida)

THE WATER SUPPLY SYSTEM UP TO A.D. 2001,
Manchester Business School (England).
Douglas Wood.
Journal of Industrial Economics, Vol XVIII, No 1, p 64-75, Nov 1969. 12 p, 3 tab.

Descriptors: *Water supply, *Water demand, *Costs, *Cost minimization, *Economic feasibility, *Demand, *Joint costs, Nuclear energy, Technology, Cost-benefit analysis, Electrical power costs, Economics, Water purification, Reservoirs, Water distribution, Pricing.
Identifiers: *Barrage, *Joint production, *Opportunity costs, *Social costs.

The article attempts to deal with the prospective water supply deficit for the year 2000. Although the example used in this study is the English water problem, the techniques and problems studied are of general significance for the water resource planner. The determinants of the domestic, industrial and agricultural demand are explained and estimates made. A number of ways of fulfilling this demand are explained along with their feasibility from a cost-benefit point of view. It appears that, when considering social costs and benefits, a barrage has a clear advantage over any conventional scheme. The problems associated with joint production of electricity and water are studied with special concentration on allocation of costs. The only valid economic technique is to use the opportunity cost of securing an equivalent production from an alternative source. This method of cost allocation is studied and conclusions are reached regarding the most economically feasible method of meeting water demand. (Murphy-Rutgers)
W70-03842

RETURNS TO SCALE AND COST CURVES,
Washington Univ., Seattle.
Lowell Bassett.
The Southern Economic Journal, Vol XXXVI, No 2, p 189-191, Oct 1969. 3 p, 1 fig.

Descriptors: *Returns to scale, *Costs, *Input-output analysis, Economics, Cost minimization, Prices, Average costs, Mathematical studies, Productivity, Economies of scale.
Identifiers: *Production functions, Indifference curves, Homogeneous functions.

The article attempts to clarify some of the confusion about the relationship between returns to scale and per unit economic costs. Increasing returns to scale implies that average cost is decreasing; however, constant returns permit either constant or decreasing per unit costs while the condition of decreasing returns is consistent with increasing, constant or decreasing average costs. Thus, it is shown that knowledge of the slope of the average cost curve is not sufficient justification for saying anything about returns to scale for the general class of production functions. Owing to the importance of production functions and costs analysis in water resource development, this article should prove useful to the water resource planner. (Murphy-Rutgers)
W70-03844

6D. Water Demand

LARGE VOLUME - LONG DISTANCE FRESH WATER TRANSFERRAL AS AN ALTERNATE TO DESALINATION,
Hudson Inst., Croton-on-Hudson, N.Y. Economic Development Studies Section.
Basil Candela, Ronald Dagon, John Karlik, and Robert Panero.
Hudson Institute, Croton-on-Hudson, NY, 1968. 52 p, 22 tab, 6 fig. HI-923/2-P.

Descriptors: *Arid lands, *Southwest U.S., *Water transfer, Desalination, *Mississippi River, Costs, Economic feasibility, Aqueducts, Pumping plants, Reservoirs, Tunnels, Oklahoma, Texas, New Mexico, Arizona, Colorado River Basin, Dams, Water demand, Evaporation.
Identifiers: *Arkansas River.

A preliminary evaluation was made of the transfer of Mississippi and Arkansas River water from 800 to 1600 miles to the southwestern U.S. as an alternative to desalination. The system described would use about 10% of the Mississippi flow transferred by pumping stations, reservoirs, tunnels and aqueducts to Texas, Oklahoma, New Mexico, Arizona, and the lower Colorado River use areas. It is concluded that such water transfer could be done at a cost of 5 to 12 cents per thousand gallons. This is substantially lower than estimated desalination costs of 20 to 30 cents per 1000 gallons plus costs of delivery. The arid areas of the Southwest could be dependably and permanently watered by a transfer system such as proposed for an investment of 5 to 12 billion dollars. The desirability of investing in such a large scale system would be dependent upon whether the Southwest could develop a demand for such a volume of water. (Crouse-Arizona)

THE WATER-RESOURCE COMMUNICATIONS GAP,
William S. Foster.
The American City Vol LXXXIV, No 10, p 83-86, Oct 1969. 4 p, 9 ref.

Descriptors: *Water purification, *Economics, *Pollution, Aeration, Biological treatment, Government supports, Water supply, Water demand, Desalination, Piping, Water storage population, Management, Costs, Farm wastes, Measurement, Computers.
Identifiers: *Mechanical chemical, Agricultural pollution, Metering, Water reuse, Chemical pollution.

The author predicts a huge increase in the amount of water demand in urban areas based on population predictions. He considers various aspects of the prospective problem along with the economic, esthetic, and safety factors. The economic feasibility of desalting sea water is discussed as well as the changes required in above ground storage, piping and metering practices. He stresses the necessity for improved water quality and describes some of the dangers of agricultural pollution. The article concludes with a discussion of the low initial but high operating costs of the mechanical-chemical water purification plants and the necessity of making the public aware of the problem. THE TIDELANDS CONTROVERSY AND LOUISIANA'S EXPERIENCE IN THE DISPUTE,
J. Gremillion.
In: 1963 Tulane Tidelands Inst, p 77-105, Claitor's Book Store (1963) Baton Rouge, La.

Descriptors: *Louisiana, *Submerged Lands Act, *Tidal waters, *Continental shelf, Federal government, State governments, Coasts, Relative rights, Leases, Judicial decisions, Legislation, Legal aspects, High water mark, Low water mark, Oil fields, Boundary disputes, Gulf of Mexico, California, Texas, Mississippi, Alabama, Florida, Treaties, Littoral.
Identifiers: Tidal lands, Made lands.

This report by the Attorney General of Louisiana examines the history of the tidelands controversy up to May 15, 1962. The controversy is described in chronological sequence beginning with Senate Joint Resolution 208, 75th Congress 1st Sess, which although ultimately defeated, proposed to declare the bed of the sea within three miles of the shore of the United States to be property of the federal government. Both the litigation and legislation involved in the controversy are outlined with emphasis upon the Submerged Land Act of 1953. The report discusses: (1) federal leasing in the contested areas; (2) the placing of lease revenue in escrow by the United States and Louisiana; (3) made-land problems; (4) the effect of the Geneva Convention; (5) equal boundary legislation; and (6) the work of the 1962 Coast Line Committee. A glossary defines: tidelands, littoral state, lands beneath navigable waters, made-lands, coast line, boundaries, continental shelf, inherent sovereignty, paramount rights, baseline, and marine league. Reference is also made to the Norwegian Fisheries Case and to the Outer Continental Shelf Lands Act. Emphasis is placed upon the Louisiana situation. (Marsee-Florida)

SHAPING THE LAW OF WEATHER CONTROL,
V. Ball.
Yale L J, Vol 58, No 2, p 213-244, Jan 1949. 32 p, 131 ref.

Descriptors: *Weather modification, *Legal aspects, *Political aspects, *Artificial precipitation, Cloud seeding, Climatology, Cloud physics, Conservation, Droughts, Federal government, State governments, Meteorology, Rain, Storms, Weather, Water shortage, Water supply, Weather forecasting, Flood control, Hurricanes, Hail, Lightening, Snowfall.

In analyzing the legal problems involved in artificial modification or control of the weather, this article discusses: (1) scientific advances in weather modification and their possible application; (2) storm modification including thunderstorms, hail, lightening, snowstorms and hurricanes; (3) water storage and drought alleviation; (4) prevention of freezing rain, sleet and glaze; (5) cloud and fog dispersal; (6) forest fires; (7) flood control; (8) military uses; (9) classes of legal disputes arising from weather modification; (10) criminal prosecution and similar statutory penalties; (11) tort liability; (12) discovery, proof and causation; (13) government conduct in the area; (14) security restrictions on weather experiments; (15) claims of property in weather phenomena; and (16) water rights. A program for action for solution of the legal problems relating to weather control and experimentation deals with: (1) temporary prevention of irresponsible activity; (2) government-sponsored activity; (3) government authority; (4) government liability and waiver of immunity; and (5) authority to indemnify government contractors for losses incurred by liability for damages. (Marsee-Florida)

MINERAL RIGHTS VERSUS WATER RIGHTS,
Edward W. Clyde.
Nat Res Lawyer, Vol 2, No 4, p 299-328, Nov 1969. 30 p, 99 ref.

Descriptors: *Water management (Applied), *Utah, *Mineralogy, *Preferences (Water rights), Prior appropriation, Dewatering, Mine water, Mine drainage, Mining, Coal mines, Mineral industry, Strip mines, Land subsidence, Prescriptive rights, Hydrologic cycle, Irrigation, Land subsidence, Water rights, Water allocation (Policy), Natural flow doctrine, Competing uses, Equitable apportionment, Overlying proprietor, Water reuse, Water salvage, Water pollution, Legal aspects, Oil, Natural gas.

In a time of increasing technological progress, the law must change to meet the needs of the evolving society. Today, increased individual use by industry of our natural resources is prescribed by the law that has grown out of the needs of our society. The individual must bend to the will, i.e. the law, of the majority. In the area of water use and the mining of coal, oil, and minerals, a balance between the individual's use and the needs of the general public is necessary. An extensive review of case law in the western United States examines the law of the country which balances the rights of the individual versus the individual, the individual versus industry and the individual versus society. The major emphasis is on the mining industry and its use of percolating, ground and surface waters termed therein as the private right to develop land versus private water rights. The right of eminent domain to acquire rights of way to put water to beneficial use is examined. Other problems in the general area of competing uses of water are discussed. (Barnett-Florida)

REGULATION OF FERRY OPERATIONS.
Ohio Rev Code Ann secs 4583.01 thru 4583.17 (Page 1965).

Descriptors: *Ohio, *Boats, *Boating regulations, *Transportation, Legal aspects, Streams, Navigation, Regulation, Navigable waters, Riparian rights, Riparian land, Legislation, State governments, Rates, Permits, Control, Standards, Operation.

Licenses must be procured by individuals who desire to operate and maintain ferries within the state. Persons owning land on both sides of a stream at the proposed location of a ferry have the exclusive right to operate the ferry at that site. Maximum rates for transporting persons and property by ferry are established by the court. Minimum daily service requirements for ferry operation are set forth. Penalties are provided for ferrymen who fail to meet these operation requirements or who charge excessive rates. (Casey-Florida)

DUTIES OF DIRECTOR OF PUBLIC WORKS REGARDING SWAMP LANDS.
Ohio Rev Code Ann sec 155.06 (Page 1969).

Descriptors: *Ohio, *Swamps, *Land tenure, *Real property, Legislation, Wetlands, Surveys, Mapping, State governments, Administrative agencies, Federal government, Legal aspects, Patents, State jurisdiction, Marshes, Maps, Proprietary power.

The Director of Public Works is required to obtain scrip and patents for all lands belonging to the state. The Director must make a record of all swamp, marsh, and overflow lands to which the state has or should have title and attempt to perfect title to such lands which might belong to the state. He is directed to collect for the state all money due from the federal government for lands sold or purchased within the state by the United States or its agents. The Director is to survey all state lands, have plats made and file them with the state auditor, and record the title to such lands in the proper county. The Governor may impose additional duties upon the Director concerning claims against the federal government or lands belonging to the state. (Schram-Florida)

COUNTY FISHING LAKES AND RECREATION GROUNDS.
Tenn Code Ann secs 11-801 thru 11-803 (1956).

Descriptors: *Tennessee, *Recreation, *Lakes, *Recreation facilities, Legislation, Eminent domain, Condemnation, Compensation, Local governments, Construction, Real property, Fishing, Sport fishing, Legal aspects, Wildlife management, Public lands, Public benefits, Damages, Assessments, Payment, Resource development, Area redevelopment.

Any county court may acquire by gift, purchase, or condemnation any natural lakes or lands suitable for the construction of lakes. The county may hold fee simple title to the land and may acquire it under the laws of eminent domain. Before any natural lake or lands adapted for the construction of lakes is condemned, an engineer's plat must be made and filed in the county register. After such filing the county court may acquire the property which shall be dedicated to the public use under the game and fish laws of the state. All compensation and damages for property acquired for these purposes shall be a direct charge upon the general county fund and shall be paid when properly assessed under the laws of eminent domain. (Schram-Florida)

BRIDGES.

Mo Ann Stat secs 234.100 thru 234.200 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Bridges, *Right-of-way, *Financing, Administrative agencies, Government finance, Legislation, Legal aspects, Navigable waters, Streams, Condemnation, Eminent domain, Projects, Local governments, Construction, Maintenance, Assessments, Highways, Civil engineering, Bridge construction.

Any Missouri city adjoining a navigable stream and separated by such stream from a Missouri county and the county court of such county may unite in purchasing a right-of-way over any bridge crossing such stream. The city and county may unite for construction of a proposed bridge across a navigable stream. The financing and assessment of costs incurred by purchasing such rights-of-way are regulated. Condemnation proceedings to secure a public access to such bridge are governed. A toll bridge connecting two counties is permitted when the bridge cannot be built, reconstructed, or maintained at county expense due to the lack of funds or power to raise the funds. The building or reconstruction of a toll bridge to be located wholly within one county is regulated. A toll bridge is part of the Missouri highway system. The Missouri State Highway Commission is authorized to join with the state highway commission of another state in contracting for a toll bridge to connect the two states. (Powell-Florida)
W70-03750

BRIDGES.
Mo Ann Stat secs 234.210 thru 234.350 (1952).

Descriptors: *Missouri, *Bridges, *Local governments, *Bridge construction, Legislation, Easements, Right-of-way, Condemnation, Financing, Real property, Eminent domain, Highways, Administrative agencies, Supervisory control (Power), Construction costs, Loans, Interest, Assessments, Costs, Maintenance costs, Government finance, Tunnels, Tunnel construction.
Identifiers: *Toll bridges.

Any political or civil subdivision of the state may acquire, construct, and operate toll bridges, within or adjacent to its jurisdiction, and over any waters in or forming the boundary of the state. These state agencies may acquire, by purchase or eminent domain, all necessary land, rights-of-way, easements, and materials for constructing, improving, or maintaining toll bridges. The State Highway Commission, when in the best interests of the state, may contribute up to thirty percent of the construction costs of these bridges and may maintain such bridges as a part of the state highway system. Qualifications and procedures for financing the toll bridges are detailed. Cities operating under special charter are authorized to acquire or construct bridges and viaducts and maintain them for the public use. For this purpose lands, easements, rights-of-way, and other property rights may be purchased or acquired by condemnation. First class cities and cities of over one hundred thousand population may construct bridges and tunnels for public use. (Schram-Florida)
W70-03751

TENNESSEE-MISSOURI BRIDGE COMMISSION.

Mo Ann Stat secs 234.360 thru 234.420 (1952).

Descriptors: *Missouri, *Bridge construction, *Interstate compacts, *Interstate commissions, Bridges, Tennessee, Legislation, Financing, Planning, Maintenance, Repairing, Compensation, Condemnation, Supervisory control (Power), Cost repayment, Real property, Maintenance costs, Construction costs, Costs, Bridge construction, Mississippi River, Administrative agencies, Easements.
Identifiers: *Tolls, Toll bridges, Ferries.

The Governor, with the advice and consent of the Senate, will appoint three commissioners to enter into a compact with Tennessee. The Tennessee-Missouri Bridge Commission is created with the following powers and duties: (1) to plan, construct, maintain and operate a bridge across the Mississippi River at or near Caruthersville, Missouri; (2) to purchase, maintain and operate any or all ferries across the Mississippi River within twenty-five miles of the bridge; (3) to contract and acquire property by condemnation or otherwise; (4) to issue bonds for the payment of the costs of the bridge, ferries, and necessary property on the security of the revenues derived from the operation of the bridge and ferries; (5) to establish and charge tolls for transit over such bridge and ferries; and (6) to perform all other necessary and incidental functions. Toll rates will be charged to provide funds sufficient to pay for maintenance, repairs, and operation of the bridge, and to pay the principal and interest on outstanding bonds. The administrative composition of the Commission is provided for. Upon the retirement of all bonds and the conveyance of title to the bridge to the states of Missouri and Tennessee, the Commission will be dissolved. (Schram-Florida)
W70-03752

MISSOURI--ILLINOIS BRIDGE COMMISSION.

Mo Ann Stat secs 234.500 thru 234.570 (Supp 1970).

Descriptors: *Missouri, *Interstate commissions, *Supervisory control (Power), *Bridge construction, Administrative agencies, Federal government, State governments, Structures, Financing, Mississippi River, Real property, Condemnation, Easements, Legislation, Regulation, Planning, Illinois, Operation and maintenance, Interstate compacts, Interstate rivers, Bridges.
Identifiers: Penalties (Civil), Ferries, Tolls.

The states of Missouri and Illinois establish by compact an Illinois-Missouri Bridge Commission to plan, construct and maintain a bridge across the Mississippi River between the two states. The Commission may purchase, maintain, and operate all ferries within fifteen miles of the site selected for the bridge. It may acquire real property necessary for construction of the bridge. It may issue bonds to finance the bridge and charge tolls for transit over the bridge. When the bonds have been retired, each state shall own that part of the bridge within its borders, and thereafter the bridge shall be toll free. The organization of the Commission is described. The compact is to be submitted to the United States Congress for approval. The Commission shall be dissolved upon retirement of all bonds and conveyance of title to the bridge to the two states. (Duss-Florida)

FERRIES AND WHARVES.

Mo Ann Stat secs 237.010 thru 237.240 (1952).

Descriptors: *Missouri, *Docks, *Boats, *Permits, Boating regulations, Rates, Legislation, Boating, Cities, Local governments, Ships, Legal aspects, Transportation, Leases.
Identifiers: *Ferries, *Licenses.

A license is required in order to keep a commercial ferry. Procedures for the application, issuance, continuation and revocation of ferry licenses are provided. Ferriage rates are fixed by the county court. Any city, town, or other municipal corporation may lease to any owner of boats, steamboats, or vessels any portion of the city or town wharf or landing for the purpose of maintaining wharf boats to accommodate steamboats and merchants in the reception and discharge of freights. (Powell-Florida)
W70-03755

ISLANDS AND ABANDONED RIVER BEDS.

Mo Ann Stat secs 241.290 thru 241.340 (1952).

Descriptors: *Missouri, *Islands, *Beds, *Ownership of beds, Dry beds, Local governments, Legislation, Lake beds, River beds, Navigable waters, Streambeds, Meanders, Compensation, Boundaries (Property), Surveys, Land reclamation, Public lands, Swamps, Mapping, Real property, Overflow, Federal reclamation law, Legal aspects, Reclamation, Land forming.
Identifiers: Counties.

Unless otherwise appropriated, all state lands formed by the recession of waters from old lake and river beds or by the formation of islands in the navigable waters of the state are transferred to the respective counties in which they are located. These lands are to be held for school purposes. All state lands hereafter found in the above manner shall also be transferred to the counties for school purposes. All counties in which such lands are situated may survey and sell them in the same manner as reclaimed swamp lands. The proceeds of such sales shall become a part of the swamp land school funds of the counties. In surveying these lands, the surveyor shall: (1) connect the survey with some United States survey corner; (2) meander islands and such beds as may abut on a navigable river or lake; and (3) subdivide such lands into section and quarter sections. (Schram-Florida)
W70-03759

TOWN OF PALM BEACH V CARTER (PROHIBITION OF SURFING WITHIN TOWN LIMITS FOUND CONSTITUTIONAL).

229 So 2d 3-5 (4th DCA Fla 1969).

Descriptors: *Recreation, *Surf-boarding, *Water sports, *Beaches, Attitudes, Swimming, Public health, Safety, Local governments, Surf, Shores, Legislation, Judicial decisions, Legal aspects, Cities, Motivation.

The defendant was convicted in municipal court for violating an ordinance prohibiting operation of a surfboard adjacent to any beach within the town limits. The circuit court reversed the conviction, declaring the ordinance to be an unconstitutional exercise of the municipality's police power. The district court reinstated the municipal court's conviction. The district court stated that the constitutionality of the ordinance depended upon whether or not it had a natural relation to the health, morals, safety, or general welfare of the public. Finding that the ordinance was designed to make the public beaches safe and was prompted by the town's decision that surfing had become hazardous to bathers, the court concluded that the ordinance was a reasonable exercise of the police power. (Schram-Florida)
W70-03764

UNITED STATES V 967.905 ACRES OF LAND (CONDEMNEES DEMAND COMPENSATION FOR BARGES ON LAKE SURROUNDED BY CONDEMNED LAND).
305 F Supp 83-93 (D Minn 1969).

Descriptors: *Minnesota, *Eminent domain, *Condemnation, *Compensation, State governments, Federal government, Federal jurisdiction, Federal reservations, Public lands, Real property, Condemnation value, Fishing, Lake shores, Lakes, Legislation, Foreign countries, Conservation, Judicial decisions, Legal aspects, Boats, State jurisdiction.
Identifiers: Canada.

The United States took certain land by eminent domain to establish a wilderness area. The condemnees contended that they should be compensated for three cabin barges which had been used in the operation of condemnees' fishing business and which could not be practically removed from the condemned land. The district court held that the condemnees were entitled to compensation for the barges. Applying Minnesota's law of eminent domain, the court found that personal property attached to the land is considered a fixture and therefore a part of the land. The barges were found to be adapted solely for condemnees' fishing operation and not practically removable from the lake bordering the condemned realty. Because the government had condemned all the land surrounding the lake rendering the barges inaccessible, and because the peculiar nature of the barges made abandonment necessary, condemnation of the land constituted a substantial, direct, and immediate taking of the barges. (Schram-Florida)
W70-03765

FORDS AND PUBLIC BRIDGES (CLEARING OF FORDS AND BUILDING OF BRIDGES).

Tenn Code Ann secs 54-1101, 54-1103, 54-1107, 54-1109, 54-1113, 54-1125, 54-1128 (1968).

Descriptors: *Tennessee, *Bridges, *Bridge construction, *Local governments, Rivers, Streams, Swamps, Cost allocation, Roads, Timber, Legislation, Legal aspects, Construction costs.
Identifiers: *County courts, *Fords.

County courts may clear out fords of rivers where public roads cross. Magistrates of each district shall report to the county court which fords they think should be cleared. Methods of clearing fords are described. Two counties divided by a river may agree to jointly construct and pay for a bridge over such river. County courts have the power to construct bridges over streams or rivers running through the counties, provided such bridges shall be located near a public highway. County courts may construct free bridges within the corporate limits of county seats. Joint county and city bridges are authorized. (Duss-Florida)
W70-03773

ESTABLISHMENT OF FREE FERRIES.

Tenn Code Ann secs 54-1201 thru 54-1203, 54-1206 (1968).

Descriptors: *Tennessee, *Streams, *Public benefits, *Condemnation, Navigable rivers, Boats, Rivers, Navigable waters, Banks, Roads, Regulation, Joint costs, Financing, Legislation, Cost allocation, Non-navigable waters, Operation and maintenance, Road construction, Legal aspects.
Identifiers: *Ferries, Landings.

All counties may, through the county court, establish, equip, and operate free public ferries over any streams running through or bounding such counties. Counties have the power to condemn land for approaches to the ferries and for landings at the river banks. Such condemnation shall conform to the condemnation procedures for county roads. Two or more counties may cooperate in establishing ferries across navigable or unnavigable streams bordering such counties and share the costs of the construction among themselves. County courts have the power to appropriate money for the establishment of ferries and ferry roads on any navigable stream and for the construction of necessary roads across river bottom lands and up and down river banks to such ferries. (Duss-Florida)
W70-03774

HIGHWAYS, BRIDGES AND FERRIES (PRIVATE AND LOCAL IMPROVEMENTS).

Tenn Code Ann secs 54-1701 thru 54-1732 (1968).

Descriptors: *Tennessee, *Bridges, *Boats, *Bridge construction, Legal aspects, Civil engineering, Mill dams, Legislation, Engineering structures, Riparian rights, Streams, Navigable waters, Construction, Maintenance, Banks, Bank erosion, Riparian land, Bank stabilization, Sedimentation, Sediment control.
Identifiers: *Ferry, Ferry boats, Obstruction to navigation.

The county court authorizes private and local improvements on toll bridges, causeways across bottoms, fish traps, milldams, and ferries. A bridge, milldam, fish trap or other improvement obstructing a navigable stream is prohibited. A petitioner in order to construct a toll bridge, milldam, or other obstruction across any river or watercourse must own or have consent of the owner of land on both sides of the watercourse. Provisions cover proposed improvements on and construction of toll bridges across a stream dividing counties. The county court authorizes the erection of ferries. Where banks are owned by different persons, each owner may keep a ferry and must repair both banks. Banks or approaches to public ferries on all streams must be graded and macadamized as prescribed. After any high water the owner or keeper of a ferry must wash or shovel sediment back with the fall of the stream. Ferryboat construction is regulated. Every person licensed to keep a ferry or toll bridge must be bonded. (Powell-Florida)
W70-03775

FISH AND GAME.

Tenn Code Ann secs 51-201 thru 51-235 (1966), as amended, (Supp 1969), secs 51-236, 51-237 (Supp 1969).

Descriptors: *Tennessee, *Fishing, *Permits, *Fish conservation, Fish management, Legislation, Legal aspects, Regulation, Fishing gear, Baits, Sport fishing, Commercial fishing, Recreation, Water utilization, Fish, Brook trout, Brown trout, Rainbow trout, Administrative agencies, Minnows, Fish stocking, Ponds, Lakes, Reservoirs, Fisheries, Fish hatcheries.

Taking fish without a license is illegal. Children under sixteen and military personnel on furlough are not required to purchase a sport fishing license. License exemptions are extended to persons fishing in their resident county and to owners and tenants of farm lands and their dependent children. Certain persons are entitled to a free sport fishing license. A commercial fisherman is any person who takes or who aids and assists another in taking fish or other aquatic life from Tennessee waters for pay or the purpose of sale, barter, or exchange. Wholesale fish dealers are defined and regulated. Minnow bait dealers are regulated. Persons operating a commercial or private lake, pond, or reservoir must be licensed. Fish stocking is a Tennessee state prerogative. Persons taking or attempting to take brook, rainbow, or brown trout must have a trout license in addition to the fishing license. A catch-out pond is an artificially impounded body of water in which artificially propagated fish or rough fish are held available for anglers and purchasers. Fish farming is the rearing of artificially propagated, non-bait fish for the purpose of sale. (Powell-Florida)
W70-03776

HUNTING AND FISHING REGULATIONS.
Tenn Code Ann secs 51-401 thru 51-442 (1966), as amended, (Supp 1969).

Descriptors: *Tennessee, *Fishing, *Fish conservation, *Regulation, Legal aspects, Legislation, Administrative agencies, Suckers, Fish management, Bait fishing, Commercial fishing, Sport fishing, Baits, Fish, Fishing gear, Recreation, Sport fish, Fish stocking, Freshwater fish, Lakes, Streams, Nets, Minnows, Aquatic animals, Electrofishing.
Identifiers: *Game fish, *Grabbling.

Fishing is lawful in any lake or stream when the supply of fish adequately allows their taking without danger of extinction or depletion. The state Game and Fish Commission sets the creel, size, and

bag limits, and manner and means of taking fish during the open season. Open season on private lakes is set by the operator. Game fish are defined by species and common names. The sale and taking for sale of game fish is regulated. Fishing in Reelfoot Lake is regulated. Shooting into Tennessee waters for the purpose of taking fish is illegal. Seines are forbidden except in private waters, in waters which are replenished by annual or periodic overflows from listed waters or other waters designated by the Commission. Grabbling, the taking of fish by hand, is prohibited. The use of nets, seines, snag lines, drag lines, grab hooks, baskets, or any other form of fishing is regulated in designated areas. The taking, transporting, and sale of minnows for bait is controlled. The taking of fish, mussels, and other aquatic animal life other than game fish is required. The use of dynamite, electricity, explosives, chemicals, lime or poison in taking fish is prohibited. There is a restricted season on all species of sucker and red horse fish. (Powell-Florida)
W70-03777

FISH AND GAME (ENFORCEMENT OF GAME AND FISH LAWS).

Tenn Code Ann secs 51-701 thru 51-717 (1966).

Descriptors: *Tennessee, *Regulation, *Legal aspects, *Wildlife conservation, Legislation, State governments, Administrative agencies, Administration, Trapping, Hunting, Fishing, Judicial decisions, Wildlife, Frogs, Game birds, Habitat improvement, Wildlife management, Permits, Equipment.
Identifiers: Penalties (Criminal), Confiscation.

The Fish and Game Law provides administrative, procedural and judicial guidelines for the enforcement of its mandates. The law is enforced by the officers of the Game and Fish Commission. Penalties for violations are prescribed. Violators will be prosecuted before a justice of the peace and if found guilty will have a right of appeal to the circuit court of the county. A mistake of fact by the violator shall be no defense. Game taken illegally and illegal equipment shall be impounded and upon conviction declared contraband. Contraband shall be sold at public sale, the proceeds of which shall go to the Fish and Game Fund. All property used in violation of sections 51-425 to 51-427 of this act is declared contraband, and is subject to seizure and public sale. Claimants to such property must adhere to procedural guidelines herein requiring a hearing, posting of bond and, upon adverse ruling by the Commission Director, a review by the circuit court. Remedies provided herein are exclusionary to all others. A monthly report of all fines and forfeitures must be filed by the circuit court. The grand juries of each county shall have inquisitional powers into offenses alleged under this act. (Barnett-Florida)
W70-03778

LIABILITY OF LANDOWNER TO PERSONS USING LAND.

Tenn Code Ann secs 51-801 thru 51-805 (1966).

Descriptors: *Tennessee, *Recreation, *Land use, *Land tenure, Legislation, State governments, Regulation, Boating, Camping, Swimming, Water sports, Access routes, Hunting, Reasonable use, Camp sites, Permits, Real property, Channels, Legal aspects, Relative rights, Remedies, Damages.

A landowner is defined as the legal title holder, lessee, or occupant of any land or premises. 'Land' or 'premises' includes all real property, waters, private ways, and any timber or structures located thereon. The landowner has no duty of care to keep his land safe for entry or use by others for hunting, fishing, camping and like activities, nor is he required to give warning of hazardous conditions existing on such land. In granting permission to use his land, a landowner extends no assurances that the land is safe or that he will assume responsibility for any injury incurred. A person given permission to use the land does not acquire the status of invitee by virtue of such permission. Willful or malicious failure by the landowner to guard or warn against a dangerous condition will render him liable for injury notwithstanding this section. The landowner may be liable for damages if the injury is incurred by one who pays consideration for permission to engage in hunting, fishing, or sightseeing, or if one granted permission to use the land by the landowner causes injury to a third party on such land. OCEAN MINERALS AND THE LAW,
Hollis M. Dole.
Nat Res Lawyer, Vol 2, No 4, p 352-359, Nov 1969. 8 p.

Descriptors: *Mining, *Oceans, *Exploitation, *Placer mining, Legal aspects, Federal jurisdiction, Exploration, Oceanography, Geology, Marine geology, Continental shelf, Oil, Natural resources, Oil fields, Oil industry, State jurisdiction, State governments, Water resources development, Beds, Leases, Mineral industry.

Improved technology and depletion of mineral resources located on land have refocused attention on the seas as sources of minerals. Ocean minerals include materials dissolved or suspended in water, materials in rocks beneath the ocean, and metallic mineral deposits concentrated by oceanographic processes. The latter raise the greatest legal problems concerning operation of extraction facilities and leasing of mineral rights. The development of near-shore placers, which are accumulations of heavy minerals caused by water movements, will lead to development of offshore mineral resources. Laws must be enacted to allow near-shore placer mining or no further technological development will be possible. Most states have ignored the problem, relying on existing onshore mining legislation. This legislation is now inadequate because it applies to outdated methods of ocean floor mining. The Coastal States conference on a Multiple Use Approach to Offshore Mining Law discussed relevant legislation, but its findings are not yet published. Under the Outer Continental Shelf Lands Act the federal government is authorized to lease mineral rights in the ocean bottom. This authority should be exercised in a manner designed to encourage development of placer mining. (Dye-Florida)

WASTEWATER RATES AND SERVICE CHARGES IN GREAT BRITAIN,
West Hertfordshire Main Drainage Authority, Rickmansworth (England).
Richard Wood.
Journal Water Pollution Control Federation, Vol 41, No 12, p 1987-2001, Dec 1969. 14 p, 3 fig, 4 tab, 14 ref.

Descriptors: *Waste treatment, *Assessments, *Rates, *Pricing, *Taxes, Sewers, Cities, Costs, Prices, Economics, Water rates, Value, Industrial wastes, Water management (Applied).
Identifiers: *Great Britain, Service charges, Sewer charges, London.

Local government services in Great Britain are financed by levying rates on property owners. Local communities bear the full costs of wastewater treatment. Assessments of the rateable value of each property are based on the theoretical rent of the property. Wastewater treatment plants are themselves rateable, but sewers and pumping stations are not. Industrial waste charges are related to the costs of treating domestic wastewaters and are derived from formulae set up on a volume/strength/solids basis. These formulae vary with attempts to assess the 'treatability' of an industrial waste. (Knapp-USGS)

GRAYSON V COMM'RS OF BOSSIER LEVEE DISTRICT (COMPENSATION FOR LANDOWNERS FOR LEVEE DISTRICT DAMAGES).

229 So 2d 139-147 (2d Cir La 1969).

Descriptors: *Louisiana, *Judicial decisions, *Eminent domain, *Compensation, Levees, Drainage, Drainage districts, Riparian land, Flood protection, Channels, Channel improvement, Legislation, Navigable rivers, Severance, Flood control, Real property, Legal aspects, Condemnation, Damages, Bank stability, Dredging, Administrative agencies, Swamps, Bayous.
Identifiers: *Levee districts.

Plaintiff landowners brought an action against the Levee Board for damages resulting from the enlargement of a drainage channel. After receiving a judgment for one-half of the value of their land occupied by the Levee District, the plaintiffs appealed, complaining of an inadequate award of damages. The main issue on appeal was the nature of the plaintiffs' land. The defendants claimed that it was riparian. According to a constitutional provision compensation should be limited to the assessed value of the land. The court held that for the land to be riparian, it must have fronted on a navigable river when the land was first separated from the sovereign. Finding that the land in question was not riparian when separated from the public domain, the court held that the constitutional limitation was not applicable. The fact that the plaintiffs also owned another tract which was riparian was held to be immaterial. In addition to damages to the land, the court held that the plaintiffs were entitled to recover for the destruction of pecan trees on their land as well as for their expenses for spreading the spoil dirt that was piled on their land by the Levee District. LEGAL ACTIONS RELATING TO WATERCRAFT.

Ohio Rev Code Ann secs 4585.01 thru 4585.15 (Page 1965).

Descriptors: *Ohio, *Boats, *Damages, Legislation, Regulation, Contracts, Transportation, Bodies of water, Docks, Admiralty, Navigation, Construction, Legal aspects, Navigable waters, Remedies.
Identifiers: Penalties (Criminal).

Watercraft operating within the state are liable for injuries caused to persons or property by the watercraft, or by the captain or his agents. Such liability constitutes a lien on the watercraft. Liability may also attach for debts contracted for construction or maintenance of the craft. Claimants in any action for debt may proceed against the owner of the watercraft, the master who contracted the debt, or against the watercraft itself. It is unlawful to injure or destroy a watercraft of another. Criminal penalties for violations of the statute are provided. (Casey-Florida)
W70-03915

NAVIGATION (ERECTION OF AIDS TO NAVIGATION).

Ohio Rev Code Ann secs 4581.01 thru 4581.12 (Page 1965).

Descriptors: *Ohio, *Buoys, *Navigation, *Ohio River, Legislation, Legal aspects, Navigable waters, Transportation, Rivers, Lakes, Canals, Harbors, Ships, Boats, Recreation, Beaches, Swimming, Docks, Regulation, Permits, Coasts.
Identifiers: *Navigational aids, *Licenses.

Anyone interested in the navigation of a navigable water may erect and maintain on such waters buoys, lamps, or lanterns to facilitate navigation or to protect bathing areas. Watercraft are prohibited from entering these marked areas except in an emergency. Wharf boat owners on the Ohio River must remain open at all hours to accomodate travelers and handle freight. Licenses are required for those peddling stock in watercraft or intending to reside on a watercraft. (Casey-Florida)

WATER ADMINISTRATION - A SUGGESTED INSTITUTIONAL MODEL,
Clayton K. Yeutter.
University of Nebraska, Dept Agricultural Economics Rep No 46, p 1-30, Dec 1968. 30 p, 54 ref.

Descriptors: *Planning, *Water resources development, *Administration, *Water allocation (Policy), Future planning, Creativity, Governments, Administrative agencies, Marketing, Multiple-purpose projects, Research and development, Water districts, Hydrologic aspects, Model studies, Theoretical analysis, Water rights, Local governments, Water distribution (Policy), Competing uses.

If water law is to be effective, it must be preventive and not just curative. The author acknowledges the need for general guidelines for preventive water law and provides an institutional model designed to furnish these guidelines. At the top of the model is a Water Resources Board which would develop a comprehensive plan for the state, make broad policy decisions, deal with state-wide water law problems, and coordinate local activities. Local organizations, such as streamflow, groundwater, and reservoir districts would try to make water rights as measurable and transferable as possible. This model is designed to be an economically middle of the road program combining both free market allocation and agency water allocation. This means that as far as possible the free market would determine water allocation in proportion to the demanding interests. However, those interests not capable of expressing their demands in the market place would be protected by the agencies. The goal is to protect all interests through private and public regulation and to maintain a program sufficiently flexible to meet changing interests and demands. (See also W70-04011 and W70-04012). (Darragh-Florida)
W70-04010

WATER ADMINISTRATION - A SUGGESTED INSTITUTIONAL MODEL,
Clayton K. Yeutter.
University of Nebraska, Dep Agricultural Economics Rep No 46, p 2-6, Dec 1968. 5 p.

Descriptors: *Planning, *Water resources development, *Administration, *Water allocation (Policy), Future planning, Creativity, Governments, Administrative agencies, Marketing, Multiple purpose projects, Research and development, Water districts, Hydrologic aspects, Model studies, Theoretical analysis, Water rights, Local governments, Water distribution (Policy), Competing uses.

The institutional model presented here exemplifies a 'middle of the road' political-economic-administrative philosophy. It is designed to provide a system by which the concepts of market allocation and agency allocation for water use and planning can be combined so as to work effectively together. The intent of such a model is to demonstrate that the two concepts are not necessarily mutually exclusive. Here the market place will be allowed to control the allocation and use of the water supply, but there will be an agency framework available to resolve problems that the market place is not adequately equiped to handle. This model returns many of the transfer decisions to the users to be resolved by them in an atmosphere that will show which uses are most economically feasible. The trends of water planning toward more agency control have often resulted in non-economical distribution which should be avoided if possible. (See W70-04010). (Darragh-Florida)
W70-04011

WATER ADMINISTRATION - A SUGGESTED INSTITUTIONAL MODEL,
Clayton K. Yeutter.
University of Nebraska, Dept Agricultural Economics Rep No 46, p 7-17, Dec 1968. 11 p.

Descriptors: *Planning, *Water resources development, *Administration, *Water allocation (Policy), Streamflow, Ground water, Reservoirs, Future planning, Creativity, Governments, Administrative agencies, Marketing, Multiple purpose projects, Research and development, Water districts, Hydrologic aspects, Model studies, Theoretical analysis, Water rights, Local governments, Water distribution (Policy), Competing uses.

The institutional model presented is pyramidal in disign. At the peak is the Water Resources Board which is designed to promulgate and implement statewide water policy and planning. This function may necessitate sub-agencies under the Board to coordinate state and local activities, but the Board alone shall be responsible for state wide planning. At the base of the pyramid will be the local orginizations including perhaps streamflow, ground water, and reservoir districts. Local agencies can perform the task of local coordination of statewide projects. The local agency or district is also better able to communicate to the local residents the need for such planning and cooperation. (See W70-04010). (Darragh-Florida)

FLORIDA'S LAKES (PROBLEMS IN A WATER PARADISE),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 1-82, Spring 1960, 82 p, 381 ref, append.

Descriptors: *Florida, *Lakes, *Water law, *Legal aspects, Boundaries (Property), Public rights, Riparian rights, Fishing, Swimming, Relative rights, Navigable waters, Non-navigable waters, Boating, Access routes, Recreation, Consumptive use, Non-consumptive use, Meanders, Hunting, Piers, Landfills, Ownership of beds, Legislation, Judicial decisions, State governments.
Identifiers: Rights of commercial users.

This is the third in a series of articles on Florida water law discussing: (1) navigability and public rights; (2) rights attributable to navigable lakes; and (3) rights attributable to non-navigable lakes. Headings one and two contain subdivisions. Subdivisions under the first heading deal with: (1) early common law developments; (2) American definitions of navigability; (3) the relationship between meandering and navigability; (4) Florida's trust doctrine; (5) possible statutory extension of navigability; (6) additional possibilities for the recognition of public rights; (7) possible use of Spanish civil law to bolster public rights; and (8) access to non-navigable lakes by invitation of riparians. Subdivisions under heading two deal with: (1) rights of riparian owners; (2) rights of the public; and (3) rights of commercial users. As they relate to the subdivisions under heading two, the following are also discussed: (1) non-consumptive uses; (2) consumptive uses; (3) access and navigation; (4) fishing, swimming and hunting; (5) wharf and fill; (6) view; (7) lake levels; (8) passage along the shore; and (9) boating. An appendix sets forth the location, by county, township, and range, of Florida's meandered lakes. (See W70-04014 thru W70-04019). (Marsee-Florida)
W70-04013

FLORIDA'S LAKES (NAVIGABILITY AND PUBLIC RIGHTS),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 1-4, Spring 1960, 4 p, 16 ref, append.

Descriptors: *Florida, *Lakes, *Watercourses (Legal), *Public rights, Navigable waters, Ponds, Non-navigable waters, Legal aspects, State governments, Ownership of beds, Water law, Bodies of water, Standing waters, Surface waters, Bogs, Swamps, Lake beds, Navigation, Civil law, Federal government, Lakes.
Identifiers: English common law.

Lawyers and hydrologists tend to distinguish a natural lake or pond from a natural watercourse on the basis that water in a watercourse has a continuous motion, whereas in a lake or pond the water is substantially at rest. Although roughly accurate, this is an oversimplification. More accurately, a lake is essentially a close or self-contained system whereas watercourses are open systems serving as conveyors of surplus water from land to sea. The difference between a lake and pond is one of size. This article will attempt to trace the extent to which the law of lakes and ponds has turned on these differences. Florida's approach to navigability and public rights has been influenced both by common law developments and the Spanish civil law background of the state. Both will be examined. English common law granted or denied private and public rights in natural bodies of water on the basis of whether the water was navigable or non-navigable. The question of navigability was one of law, and although American courts adopted the concept of navigability, they have redefined the criteria. Different jurisdictions have developed varying definitions of navigability. (See W70-04013). (Marsee-Florida)
W70-04014

FLORIDA'S LAKES (TESTS OF NAVIGABILITY),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 4-15, Spring 1960. 11 p, 54 ref, append.

Descriptors: *Florida, *Lakes, *Public rights, *Navigable waters, Non-navigable waters, Legal aspects, Judicial decisions, State governments, Federal government, Lake beds, Navigation, Public lands, Ownership of beds, Water law, Bodies of water, Legislation, Surface waters, Recreation demand, Recreation.
Identifiers: Trust doctrine.

The federal test of navigability uses the criterion of the commerical utility of the body of water in question; it is a test of navigability in fact and allows inclusion of artifically improved waterways. Florida differs by requiring waters to be navigable in their natural state but has to date applied a commercially oriented criterion similar to the federal one. Florida courts have not yet expressly decided whether navigability embraces navigation for purely recreational purposes. Immediately following the acquisition of Florida by the United States, federally employed surveyors meandered those lakes they judged navigable. However, due to the difficulty of meandering swampy shorelines, relatively few lakes were ultimately meandered. The fact that a lake was meandered is accepted by Florida courts as evidence of navigability and therefore of public ownership, but the failure to meander a lake has been held to not conclusively evidence that it is not navigable. Navigability in fact is again the test; therefore, non-meandered lakes may be available for public use. Florida has adopted the trust doctrine and takes the position that the state holds title to lands under navigable waters in trust for the people. (See W70-04013). (Marsee-Florida)
W70-04015

FLORIDA'S LAKES (RIGHTS IN LAKES),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 15-22, Spring 1960. 7 p, 30 ref, append.

Descriptors: *Florida, *Lakes, *Public rights, *Recreation demand, Navigable waters, Non-navigable waters, Legal aspects, Civil law, Judicial decisions, Legislation, State governments, Riparian land, Riparian rights, Riparian waters, Lake beds, Recreation, Navigation, Public lands, Ownership of beds, Water law, Bodies of water, Surface waters.

In addition to the possibility of a judicial broadening of the definition of navigability, Florida might also bolster public rights of recreation by: (1) statutorily extending the concept of navigability; (2) creating special development and water conservation districts; (3) establishing a dedication of an easement for public use in non-meandered lakes; (4) granting special tax treatment to riparians who permit the public to gain access to water over their lands; and (5) utilizing Spanish civil law. Spanish civil law, unlike common law, saw nothing inconsistent in the sovereign's conveying the bottoms of certain lakes to private individuals while at the same time preserving the right of the public to traverse the water. Because of the civil law background of Florida, the Florida courts might be willing to recognize these Spanish doctrines as aids in sustaining the recognition of public rights in public waters. (See W70-04013). (Marsee-Florida)
W70-04016

FLORIDA'S LAKES (RIGHTS ATTRIBUTABLE TO NAVIGABLE LAKES),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 22-55, Spring 1960. 34 p, 165 ref, append.

Descriptors: *Florida, *Riparian rights, *Consumptive use, *Non-consumptive use, Riparian water, Public rights, Judicial decisions, Water rights, Navigation, Recreation, Withdrawal, Access routes, Fishing, Swimming, Hunting, Landfill, Water levels, Piers, Domestic water, Industrial water, Agriculture, Municipal water, Water supply, Lakes, High water mark.
Identifiers: View.

In Florida, as in most Eastern jurisdictions, riparian rights are property. To be entitled to such rights, an owner must prove his ownership of the land to the high water mark. One question is the location of that mark. Riparian rights in a navigable lake can be considered under two headings: consumptive uses and non-consumptive uses. Non-consumptive used include access and navigation, fishing, swimming, hunting, wharf and fill, view, and lake level control. These rights are discussed in light of Florida case and statutory law. Due to the abundance of easily tapped grownd water sources, Florida's lakes and streams have not been looked upon as a source of water supply by major consumptive users; both agricultural and industrial. Florida's water law with respect to consumptive uses has generally developed within the riparian system. Early cases put primary emphasis upon riparian rights of use for domestic purposes. Reasonableness of the use was not a consideration. Today, the state of Florida law with respect to withdrawal for consumptive uses is clear. Florida cases are here examined and a municipality's right, as a riparian owner, to withdraw water to supply its inhabitants is discussed. (See W70-04013). (Marsee-Florida)
W70-04017

FLORIDA'S LAKES (RIGHTS OF THE PUBLIC),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 55-63, Spring 1960. 9 p, 47 ref, append.

Descriptors: *Florida, *Public rights, *Non-consumptive use, *Navigable waters, Lakes, Riparian rights, Judicial decisions, Eminent domain, Legislation, Navigation, Recreation, Fishing, Hunting, Boating, Access routes, Parks, Shores, Regulation, Recreation demand, Lake beds, Relative rights, Swimming, Legal aspects, State governments, High water mark.
Identifiers: View.

The establishment of navigability is presently the foundation of public rights in Florida's lakes; however, the nature and extent of such rights have received very little judicial or legislative consideration. The mere fact that a lake is navigable does not guarantee public access to it. Courts generally agree that members of the public have no right to cross private property to reach navigable waters. The use of legislation or eminent domain may possibly be a means of establishing such public access. As to rights of passage and recreation along the shore of a navigable lake, since Florida holds that the riparian owner owns only to the high water mark, it may be that the public will have a right to the land between the high and low water marks. Once on a navigable lake in Florida, a member of the public has a right to use it for boating, swimming, fishing, and hunting, all subject to regulation. The right of the public to scenic enjoyment of navigable waters has not been discussed by Florida courts. Even if recognized, however, the right will have to be weighed against other public interests. (See W70-04013). (Marsee-Florida)
W70-04018

FLORIDA'S LAKES (RIGHTS OF COMMERCIAL USERS),
F. Maloney, and S. Plager.
U Fla L Rev, Vol 13, No 1, p 53-73, Spring 1960. 11 p, 62 ref, append.

Descriptors: *Florida, *Consumptive use, *Non-consumptive use, *Non-navigable waters, Commercial fishing, Boating, Hunting, Public rights, Relative rights, Judicial decisions, Legislation, Legal aspects, State governments, Lakes, Land tenure, riparian rights, recreation demand, Regulation, Leases, Lake beds, Access routes, Trees, Crustaceans, Ownership of beds.
Identifiers: Minerals, Sponges.

Non-consumptive commercial uses of Florida's navigable lakes fall into two categories: commercial navigation, and commercial fishing and hunting. Subject to regulation of unreasonable uses, a riparian owner may for commercial purposes make access to navigable lakes available to the public, and members of the public may engage in commercial fishing. Consumptive commercial uses of navigable lakes include: consumptive use of the water; and uses that are consumptive of mineral deposits underlying the lake or of substances on the bed, such as sponges, crustaceans, or cypress trees. As relates to consumptive use of things on or under lake beds, Florida has legislatively authorized the sale of minerals and timber under navigable waters, as well as the sale or leasing of the right to drill for petroleum and gas. A determination that a lake is non-navigable generally excludes the public from the use of the lake. Such lake may be owned by one or more individuals who may control it as any other piece of realty. The relative rights of such multiple owners of the lake are discussed as well as the state's right to regulate such lake. (See W70-04013). (Marsee-Florida)
W70-04019

WATER SUPPLY DISTRICTS.

Mo Ann Stat secs 247.010 thru 247.220 (1959), as amended, (Supp 1970).

Descriptors: *Missouri, *Water districts, *Water supply, *Water management (Applied), Legal aspects, Legislation, Water works, Water resources development, Water allocation (Policy), Water distribution (Applied), Sanitary engineering, Public utilities, Water rates, Condemnation, Water utilization, Eminent domain, Administrative agencies, Administration, Conduits, Environmental sanitation, Civil engineering, Construction, Maintenance.

Public water supply districts, as Missouri political corporations, promote public health and sanitation and provide conveniences in the use of water, namely ample quantity and pure and wholesome quality. Procedures for the formation of a public water supply district are enumerated. Each district is authorized to purchase or otherwise acquire water for the necessities of the district; to build, acquire by purchase or otherwise enlarge, improve, extend and maintain a system of waterworks; and to acquire private property by condemnation. The water supply district sells and distributes water to the inhabitants of the district and to consumers outside the district and fixes rates for the sale of water. A board of directors manages the business and affairs of the district. The organization and operation of the board is regulated. Methods of financing district projects are enumerated. The district has the right to lay its mains in public highways, roads, streets, and alleys in the district. The procedure for condemnation of property is designated. The district which is dependent upon purchases of water to supply its needs may sell and convey part or all of its water mains, plant, real estate, or equipment to any water corporation. The procedure for dissolution of a public water supply district is enumerated. (Powell-Florida)
W70-04022

SEWER DISTRICTS (CONSTRUCTION OF SEWERS IN UNINCORPORATED JURISDICTIONS).
Mo Ann Stat secs 249.430 thru 249.667 (1959), as amended, (Supp 1970).

Descriptors: *Missouri, *Public utility districts, *Sewage districts, *Sewers, Legal aspects, Legislation, Construction, Maintenance, Local governments, Engineering structures, Sewage disposal, Administrative agencies, Condemnation, Eminent domain, Right-of-way, Assessments, Project planning, Jurisdiction, Construction costs, Cost allocation, Operation and maintenance, Financing, Cost-benefit theory.

A majority of the landowners residing in an unincorporated area may petition the county court to establish a sewer district and provide for construction of sewers therein. The county court may designate the county highway engineer to serve as sewer engineer. The sewer engineer is responsible for advising the county court in matters relating to the establishment and maintenance of a sewer district. Sewers may be constructed to serve more than one sewer district when the county court deems this necessary. The court may condemn land or other property to secure rights-of-way for sewer construction, or for construction of other improvements. Provisions are set forth for the apportionment of costs among landowners within the district. Upon the recommendation of the sewer engineer, the county court may levy special assessments for the operation, maintenance, and repair of sewers within the district. Procedures for dissolutionment of a district are provided. (Powell-Florida)
W70-04023

CLASS TWO COUNTIES - SEWER DISTRICTS.
Mo Ann Stat secs 249.760 thru 249.810 (1959).

Descriptors: *Missouri, *Sewage districts, *Sewage treatment, *Sewage disposal, Legislation, Legal aspects, Land tenure, Boundaries (Property), Contracts, Regulation, Ditches, Utilities, Jurisdiction, Construction, Condemnation, Rates, Maintenance, Financing, Outlets, Repairing, Taxes, Estimated costs, Local governments, Pollution abatement.
Identifiers: *Sewer districts, Bonds.

Any contiguous area lying within a second class county may be incorporated as a sewer district upon the filing of a petition with the circuit court by a majority of the property owners in such area. The petition will give the reasons a sewage treatment facility and sewer system are needed. The incorporation process is outlined. Sewer districts shall have the power to: (1) elect a board of supervisors to manage district affairs; (2) contract and acquire property; (3) lay sewer lines in public roadways; (4) furnish sewage disposal outlets and construct, acquire, improve, operate, maintain and administer disposal systems, sewage treatment plants,

mains, laterals, drains and other appurtenances incidental thereto; (5) authorize the use of their facilities by other governmental subdivisions so far as the facilities' capacities are sufficient beyond the needs of the district; and (6) be parties to joint cooperative projects. The board of supervisors will establish rates for the use of the sewer districts' facilities. District administration and dissolution are provided for. The methods of financing through taxation and bond issuance are outlined. (Keith-Florida)
W70-04024

FISH AND GAME (THE WILDLIFE AND FORESTRY LAW).

Mo Ann Stat secs 252.010 thru 252.230 (1959).

Descriptors: *Missouri, *Fish management, *Fish conservation, *Water pollution effects, Legislation, Legal aspects, Wildlife, Fish, Aquatic life, Regulation, Administrative agencies, Permits, Wildlife management, Wildlife conservation, Rivers, Streams, Dams, Nets, Weirs, Fish barriers, Fish ladders, Fish passages, Pollutants, Explosives, Water pollution, Fishkill, Fish hatcheries, Supervisory control (Power).
Identifiers: *Penalties (Criminal).

Wildlife includes all wild birds, mammals, fish and aquatic life. No wildlife will be taken except in the manner, to the extent and at the times permitted by the Conservation Commission. Commission agents may search creels, containers, gamebags, autos and boats which the agents have reason to believe contain unlawfully transported or possessed wildlife. Persons owning or operating dams will erect and maintain a fishway or other device which will enable fish to have free passage through such dams. If such devices are impractical, the Commission may require the establishment of hatcheries to stock the waters above and below the dams. It is unlawful for any person to place any seine, screen, net, weir, fish dam, or other obstruction across any watercourse to obstruct the free passage of fish. It is unlawful for any person to cause any deleterious substance or explosive to be placed into any waters in quantities sufficient to injure or kill fish. Criminal penalties are provided for violation of any of the provisions of this chapter. (Keith-Florida)
W70-04026

LEASES OF FEDERAL RESERVOIR LANDS FOR RESORT PURPOSES.

Mo Ann Stat secs 253.290 thru 253.320, as amended, (Supp 1970).

Descriptors: *Missouri, *Administrative agencies, *Leases, *Land development, Operation and maintenance, Federal government, Construction materials, Construction, Conservation, Architecture, Design, Land management, Land use, Legal aspects, Legislation, Reservoirs, Recreation facilities, Parks.

The Missouri Park Board may grant leases for the development of resort facilities on federal reservoir lands which have been purchased by the state. Leases may not exceed fifty years in duration. Leases are to be granted only on the basis of competitive bidding. The Board retains the right to enter leased lands at all times. The Board may control the quality of construction materials used in the facilities and may regulate the fees charged to the public for use of the facilities. Lessees must maintain and conserve the lands and keep accurate records of their operations. Lessees may execute construction mortgages, subject to the Board's approval. (Duss-Florida)
W70-04027

WATER RESOURCES BOARD.
Mo Ann Stat secs 256.180 thru 256.260 (1959), as amended, (Supp 1970).

Descriptors: *Missouri, *Administrative agencies, *Water resources, *Water resources development, Surveys, Data collection, Investigations, Grants, Bodies of water, Federal government, Regulation, Legislation, Water management, Water utilization, Real property, Legal aspects.

A Water Resources Board is hereby created. It is the duty of the Water Resources Board to develop a long-range, comprehensive, state-wide program for the conservation, development, management, and use of state water resources. The Board is to collect data and make surveys, investigations, and recommendations concerning water resources and their relation to social and economic needs. The Board will act as a clearing house for water resources data collected by other agencies. It may enter upon any lands or waters for investigative purposes. The Board may cooperate with the United States or any federal or state agency. The Board must employ an engineer experienced in water resources as its executive director. The Governor may delegate additional authority to the Board. (Duss-Florida)
W70-04028

WATER CONSERVANCY DISTRICTS.
Mo Ann Stat secs 257.320 thru 257.490 (1959).

Descriptors: *Missouri, *Water districts, *Water conservation, *Taxes, Government finance, Administrative agencies, Water management (Applied), Legal aspects, Legislation, Financing, Economics, Administration, River basins.

The types of funds which may be used by a conservancy district and the use of money acquired as aid from a public agency are described. Tangible property within the district may be taxed. General obligation bonds may be issued by the board of trustees of a river basin conservancy district. The procedures for disincorporation of a conservancy district are enumerated. (Powell-Florida)
W70-04031

BOUNDARIES BY WATERCOURSES.
Mo Ann Stat sec 46.010 (1966).

Descriptors: *Missouri, *Watercourses (Legal), *Boundaries (Property), *Channels, Legislation, Surveys, Local governments, Legal aspects, Water law, Jurisdiction.
Identifiers: Counties.

Whenever a county is bounded by a watercourse the boundary shall be construed to be the middle of the main channel of the watercourse. Range, township, and sectional lines shall be construed as conforming to the established surveys. (Schram-Florida)
W70-04039

TAXATION OF BRIDGE AND PUBLIC UTILITY COMPANIES.

Mo Ann Stat secs 153.030, 153.040 (1952).

Descriptors: *Missouri, *Taxes, *Bridges, *Public utilities, Legislation, Assessments, Tax rate, Railroads, Cities, Local governments, Electric power, Real property, Pipelines, Payment, Utilities, Navigable waters, Streams.
Identifiers: *Toll bridges.

All private bridges over streams dividing this state from other states, all toll bridges across navigable streams, and all property owned by public utility companies are subject to taxation for state, county, municipal, and other local purposes to the same extent as the property of private persons. Taxes on these properties shall be levied and collected in the same manner as provided for the taxation of railroad property. Details of the taxation procedures are provided. In cases where a part of any bridge is in this state and a part in another state, only the portion of the bridge in this state shall be subject to assessment and taxation. (Schram-Florida)

NATIONAL RIVERS AND HARBORS CONGRESS SUPPORTS A COMPREHENSIVE WATER RESOURCES DEVELOPMENT PROGRAM,
William J. Hull.
Congressional Record, 91st Cong, 1st Sess, Sept 22, 1969.

Descriptors: *Water resources development, *Project planning, *Federal project policy, *Legislation, Cost-benefit analysis, Economics, Water Resources Planning Act, Project purposes, Planning, Project benefits, River basin development, Navigation, Flood control, Low-flow augmentation, Dams, Water management (Applied), Reservoir operation, Water requirements, Administration, Multiple-purpose projects.
Identifiers: Water resource objectives, Project evaluation.

Senator Birch Bayh states that an imperative need exists for an accelerated program of comprehensive water resource development to meet the rising water requirements of increasing population and an expanding economy. Existing criteria for the evaluation of water resource development projects are needlessly restrictive. Most water resources projects produce benefits which are often overlooked, and most projects are multi-purpose whether so recognized or not. Congress should develop national water resource goals and objectives based on economic grounds and value judgments. It is argued that a river basin approach to water resource planning should be adopted by Congress and that existing procedures whereby improvements are authorized on a project-by-project basis should be changed. This multi-purpose basin approach should apply to the whole process by which water resources projects are initiated and developed. (Caldwell-Florida)

ADMINISTRATIVE ARRANGEMENTS FOR WATER RESOURCES DEVELOPMENT IN MONTANA,
Montana State Univ., Bozeman.
Richard Sheridan.
Montana University Joint Water Resources Research Center, (1969). 3 p OWRR Project B-004-MONT.

Descriptors: *Administrative agencies, *Political aspects, *Resource development.
Identifiers: *Politico-administrative, *Water and land resources, *Restructuring, *Efficient administrative arrangement.

This study deals with the nature of the politico-administrative aspects of resources development in Montana, with particular emphasis on water resources. An extensive bibliography has been prepared relating to the general source materials about Montana's water and land resources. A review was also made of the formal organization for natural resources administration in all of the fifty states. Finally, an analysis was made of the needed restructuring of the administrative agencies within Montana to provide an efficient administrative arrangement for water resources development.

6F. Nonstructural Alternatives

AN ACTIVITY ANALYSIS OF NON-STRUCTURAL PLAIN MANAGEMENT ALTERNATIVES: CHAPTER IV,
Wisconsin Univ., Madison. Water Resources Center.
John C. Day.
Wisconsin Water Resources Center, Madison, Final Report (Partial), p 54-111, 1969. 58 p, 20 tab, 7 ref. OWRR Project B-002-WIS.

Descriptors: *Linear programming, *Management, *Flood plains, *Floodproofing, Land development, Models, Rent, Zoning, Landfills.
Identifiers: Site elevation.

A linear programming solution to a flood plain management problem was developed. The objective was to choose the appropriate land activities for a presently vacant tract of land lying in a flood hazard location. Two basic residential models were designed allowing for two different degrees of site elevation through the use of a land fill. Along with the programming models, an extensive 'side-calculation', employing the regression estimates of rents, the expected flood losses for all residential land use-location combinations and estimated costs for elevation and floodproofing, identified the set of activities that yielded positive rent. The solution was placed at the disposal of the flood plain manager a residential development plan that served as a guide for zoning, subdivision control, and building code regulations. A PROPERTY OF THE RANGE OF PARTIAL SUMS,
Geological Survey, Washington, D.C.
N. C. Matalas, and C. S. Huzzen.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 33, p 252-257, 1967. 6 p, 1 tab, 8 ref.

Descriptors: *Time series analysis, *Markov processes, *Statistical methods, Probability, Stochastic processes, Time lag, Runoff forecasting, Streamflow forecasting.

Under the assumption that time series are generated by lag-one Markov processes, an investigation was made of the degree to which serial dependence and skewness affects the ratio of the range of cumulative departures from the sample mean to the sample standard deviation. From a large number of generated sequences, the mean value of k was determined for various values of N, lag-one serial correlation, p (1), and skewness. For all values of N and p (1), skewness had no effect. Within the range of values of N and p (1) for annual sequences of river discharge, the average of values agrees with that found in observed sequences. This indicates that a lag-one Markov process may be a good approximation to the generating process of sequences of annual river discharge and that apparent long-term movements in these sequences are chance events. EXTENSION OF RAINFALL RECORDS BY INTERSTATION CORRELATION,
Stanford Univ., Calif. Dept. of Civil Engineering.
Molina Medardo.
Available for $2.00 per copy, from Stanford University, School of Engineering, Stanford, California 94305. Technical Report No 123, Dec 1969. 128 p, 24 fig, 16 tab.

Descriptors: *Precipitation, *Hydrologic data, *Correlation analysis, California.
Identifiers: Guatemala, Venezuela, Interstate correlation.

The feasibility of extending short precipitation records by correlation with nearby stations having longer records is explored. Analysis is made for annual, monthly, and daily data. Linear regression analysis is used with a random term to allow for departures from the mean relation. Data from California, Guatemala, Venezuela are used in the study. The study indicates that an initial period of record of about 15 years is adequate to establish the correlation required and that extension to stations up to 60 miles from the base station is possible when regional variability of rainfall is high and that even longer distances are possible where regional variability is relatively low. Technique is specifically designed to be of value in developing countries where few long-record rainfall stations exist. (Linsley-Stanford)

7B. Data Acquisition

GAMMA-RAY SPECTROSCOPY AS A TOOL FOR A RAPID INVESTIGATION OF DETRITIC CORES,
Centre National de la Recherche Scientifique, Gif-sur-Yvette (France). Centre des Faibles Radioactivities.
Lydie Chenouard, and Claude Lalow.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1477-1483, Dec 1969. 7 p, 5 fig, 3 tab, 12 ref.

Descriptors: *Gamma rays, *Spectroscopy, *Analytical technique, *Sediments, *Detritus, Cores, Stratigraphy, Climatic zones, Potassium, Particle size, Radium radioisotopes, Sedimentation rates, Geochemistry.
Identifiers: Gamma-ray spectrometry.

The nondestructive gamma-ray spectroscopy of a sedimentary core was used to identify five great zones of variation of potassium and thorium content in Atlantic continental shelf sediments. A sedimentological and paleoclimatic study shows that those variations correspond to climatic fluctuations. It is then concluded that nondestructive gamma-ray spectroscopy may be a valuable tool for a rapid investigation of sedimentary cores. (Gabriel-USGS)

THE INFRA-RED DETERMINATION OF QUARTZ IN SEDIMENTS AND SEDIMENTARY ROCKS,
Liverpool Univ. (England). Dept. of Oceanography.
R. Chester, and R. N. Green.
Chemical Geology, Vol 3, No 3, p 199-212, Sept 1968. 14 p, 8 fig, 2 tab, 13 ref.

Descriptors: *Quartz, *Infrared radiation, *Analytical techniques, *Sediments, Sedimentary rocks, Spectrophotometry, Rock properties, Particle size, Sampling, Laboratory tests, Methodology.
Identifiers: *Infrared technique, *Quartz adsorption band, Potassium bromide discs.

An infrared technique is described for use in making rapid, accurate determination of quartz. Quartz is an important component of many sediments and sedimentary formations, and information on its destribution is necessary for interpretation of ecological, mineralogical and geochemical conditions of deposition. The technique described utilizes introduction of sediment samples to the spectrophotometer in a solid form as KBr discs, and is made quantitative by controlling the volume of material in each disc. Quartz content of 16 sedimentary rocks and synthetic standards were analyzed by the technique; results are in good agreement with those obtained by chemical and X-ray methods. (Lang-USGS)

COLOR PHOTOGRAPHS FOR WATER RESOURCES STUDIES,
Geological Survey, Washington, D.C.
William J. Schneider.
Photogrammetric Engineering, p 257-262, Mar 1968. 6 p, 8 plate.

Descriptors: *Aerial photography, *Water resources, *Surveys, *Investigations, Water temperature, Water pollution sources, Vegetation effects, Topography, Land use, Water quality, Hydrogeology.
Identifiers: Color aerial photography, Infrared.

Air-photo interpretation is very well suited to water resources studies where limited observations of hydrologic data must be extended to regional characteristics for large areas. It is also useful in monitoring the hydrologic regimen of an area to detect possible changes. Color aerial photography is generally superior to black-and-white photography for these water resources investigations. Depth penetration through water, and excellent discrimination of water indicators, such as vegetation, are its main assets. Meaningful interpretation of the photography depends on adequate ground control data. Experiences of the Water Resources Division, U.S. Geological Survey, indicate that the best interpretation is done by professional personnel--engineers, geologists, and water chemists intimately associated with a particular water resources project for which the photography has been obtained. DESIGN OF A NEUTRON SCATTERING WATER CONTENT GAGE FOR SOILS,
Illinois Univ., Urbana.
Kenneth Preiss.
In: Isotope Techinques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 22-27, 1967. 6 p, 5 fig, 7 ref.

Descriptors: *Nuclear moisture meters, *Calibrations, *Neutron absorption, *Soil moisture meters, *Radiosotopes, Gamma rays, Radioactivity techniques, Gages, Cadmium radioisotopes, Fluctuation, Organic matter.
Identifiers: *Neutron scattering, Beryllium, Plutonium 239, Actinium 227, Americium 241.

Errors in the reading of a neutron scattering water content gage due to the chemical composition of the soil and to statistical fluctuations in the source emission rate are discussed. The effect of each cause of error may be minimized by correct design of the apparatus. The collision processes that may occur between neutrons and the atoms of a soil are described. It is shown that trace quantities of particular elements in the soil can reduce the reading, but a simple cadmium cover around the detector will eliminate their effect. Equations are given relating error in water content reading with the ordinate and slope of the calibration curve. Using these equations, it is shown that the time required to attain a given standard error in water content reading depends upon the distance between source and detector; a source to detector distance exists which gives a least time for a given error. (Carstea-USGS)
W70-03686

DEVELOPMENT OF A RADIOISOTOPE GAGE FOR MONITORING SEDIMENT CONCENTRATION IN RIVERS AND STREAMS,
Panametrics, Inc., Waltham, Mass.
Bach Sellers, Charles A. Ziegler, and John Papadopoulos.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 3-10, 1967. 8 p, 5 fig, 1 tab, 1 ref.

Descriptors: *Radioactivity techniques, *Sediment discharge, *Suspended load, *Monitoring, Gages, Streams, Rivers, Water control, Water conservation, X-rays, Cadmium radioisotopes, Instrumentation.
Identifiers: Sediment concentration gaging.

A radioisotope gage has been developed to satisfy the need for a self-powered, continuous monitoring system of sediment concentrations in rivers and streams. This gage uses X-rays from Cd 109. Basically the gage records the ratio of X-ray transmission through water containing suspended sediment and a reference cell containing distilled water. The instrument is capable of recording at 15 minute intervals over a period of 7 1/2 days with an accuracy better than 20% for sediment concentrations ranging from 1,000 to 50,000 ppm. The radioisotope gage has been field tested and it is being delivered to member agencies of the U.S. Inter-Agency Sedimentation Project for extended test and evaluation over a one-year period. MINIMIZING NUCLEAR SOIL DENSITY AND MOISTURE CONTENT GAGE ERRORS,
North Carolina State Univ., Raleigh.
Robin P. Gardner.
Highw Res Rec, No 290, p 1-8, 1969. 8 p, 15 ref.

Descriptors: *Nuclear moisture meters, Neutron counters, *Errors, Variability, Soil density, Soil mechanics, Soil moisture, Gamma rays, *Soil moisture meters, Moisture content, Calibrations, Bibliographies, Measuring instruments, Mathematical analysis, Mathematical models, Moisture meters.
Identifiers: *Nuclear density meters, Neutron moderation method, Control equipment, Accuracy, Testing equipment.

Sources of error in nuclear soil density gages are identified as sensitivity to variations in sample composition, poor calibration techniques, and sensitivity to surface heterogeneities. Errors associated with nuclear moisture content gages are identified as sensitivity to soil composition, sensitivity to soil density, and poor calibration techniques. Several approaches are evaluated for minimizing these sources of error, including mathematical analyses of the nuclear gaging principles, the calibration model method, and the dual-gage principle for nuclear density gages. The primary source of error for the gamma-ray density gage was sensitivity to soil composition. Mathematical model studies of the gamma-ray density gage indicated that changes in any single gage design parameter minimized errors caused by variations in soil composition only at the expense of increasing errors caused by surface heterogeneities. Mathematical analysis of neutron soil moisture gages has had limited success. The calibration model method shows promise for minimizing sources of error for the neutron moisture gages and the dual-gage principle for the gamma-ray density gages. (USBR)

APPLICATION OF PORE PRESSURE MEASUREMENTS TO SHEAR STRENGTH OF COHESIVE SOILS,
Bureau of Reclamation, Denver, Colo.
H. J. Gibbs, and C. T. Coffey.
Bur Reclam Rep No Em-761, June 1969. 56 p, 38 fig, 3 tab, 10 ref, 3 append.

Descriptors: *Pore air pressures, *Negative pore pressure, *Pore water pressures, Capillarity, Effective stress, Soil compression tests, Soil tests, *Test procedures, Triaxial shear, Shear strength, *Pore pressure, Research and development, Cohesive soils, Laboratory tests, Soil strength, Soil engineering, Soil mechanics, Triaxial compression.
Identifiers: Triaxial tests, Soil suction, Undrained tests, Exposed end plate method, Unsaturated soils, Testing equipment.

An accurate method of measuring pore pressure in soils is necessary for determining stress when designing soil structures. The Bureau of Reclamation has made the following advances in measuring negative pore pressures: (1) The exposed end plate method of measuring the initial negative pore pressure of soils. Negative pore pressure can be determined on a routine laboratory testing basis without damaging the specimens for further testing. (2) Measuring capillary pressure throughout the volume change range as the undrained (sealed) specimens are compressed from initial negative pore pressure to the point where the capillary pressure becomes zero at saturation. Results of this test conducted on one of a series of specimens, together with results of the exposed end plate test on each specimen of the series are applied in the analysis of soil strength from shear test results. (3) Improved accuracy in measuring pore air pressure by separating the water film in the soil from the end plate measuring device and controlling the end plate so that water is not drawn into or from the soil. Variable soil stress conditions that would be introduced by changing soil moisture conditions are eliminated. (USBR)

A. Nir.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 109-116, 1967. 8 p, 5 fig, 10 ref.

Descriptors: *Radioisotopes, *Radioactivity techniques, *Tracking techniques, Radioactive dating, Underground storage, Dispersion, Research and development, Groundwater movement, Hydrology, Hydrologic cycle, Hydrogeology.
Identifiers: Isotopes in groundwater hydrology.

A survey of development of isotope methods in hydrology reveals that the initial high hopes have been only partly fulfilled. Only a few defined areas of specific and local application have been advanced, such as determination of point velocity, aquifer storativity, hydrodynamic dispersion coefficients, and transit times through age determination. A critical evaluation of present methods of isotope data interpretation to groundwater analysis indicates that the assumptions made and the results obtained are often not compatible with the problems and approaches of the practicing hydrologists. Modifications of this approach may, however, enable comparison of isotope survey results with those obtained by other conventional methods. More basic contribution of isotope methods to hydrology seems feasible in view of this analysis and of the state of experimental techniques. It first requires, however, a more concerted effort in selected hydrological basins where diverse isotope and conventional methods could be applied and evaluated in close cooperation between hydrologists and the physical (isotope) scientists. The international hydrological decade offers a suitable opportunity for such an undertaking on a regional scale. (Carstea-USGS)

THE USE OF REMOTE SENSING IN WATER RESOURCE MANAGEMENT,
Stanford Research Inst., Menlo Park, Calif.
Robin I. Welch.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 227-242. 8 fig, 3 tab, 3 ref.

Descriptors: *Remote sensing, *Water resources, *Water management (Applied), Synoptic analysis, Analytical techniques, Marine plants, Planning, Water pollution, Aquatic environments, Aerial photography, Light quality, Dye releases, Oysters, Fluorometry, California, Silting.
Identifiers: Data acquisition, Marine resources, Freshwater resources, Multiband aerial photography, Underwater photography, Infrared photography, Kelp inventories, Oil pollution, Water movement, Humboldt Bay (Calif), San Diego Bay (Calif), Rhodamine B, Rhodamine WT, Russian River (Calif), Austin Creek (Calif), Lake Tahoe (Calif), University of California (Davis).

Because problems of water quality management are diverse and complex, data must be utilized from many sources, ranging from synoptic aerial surveys by remote sensing to painstaking laboratory analysis. Remote sensing acquires information about an object which is not in intimate contact with the information-gathering device. Application of remote sensing techniques, principally photographic, to various marine and freshwater resources in California are described, including mapping of water movements, detection of general pollutants, detection of oil pollution, and inventory of kelp beds. Extensive information tabulated in the report includes photographic specifications for various applications, film-filter combinations for detection of rhodamine and pollutants in San Diego Bay, and relative utility of spectral bands in multiband detection of oil pollution. Benefits of remote sensing include: improved analysis and inventory of aquatic environments; more effective monitoring of selected water masses; comprehensive evaluation of aquatic communities and associated terrestrial resources; timely evaluation of pollutional sources and effects; and improved data acquisition on resource development for maximal benefit and minimal environmental damage. Image interpretation requires careful comparison with ground truth in a given area before meaningful extrapolations to new situations can be made. (See Vol 3, No 7, Field 5C, entry W70-02775). ESTIMATION OF THE PARAMETERS OF GUMBEL'S THIRD ASYMPTOTIC DISTRIBUTION BY DIFFERENT METHODS,
Michigan Univ., Ann Arbor; and Georgia Inst. of Tech., Atlanta.
Rolf A. Deininger, and James D. Westfield.
Water Resources Research, Vol 5, No 6, p 1238-1243, Dec 1969. 6 p, 1 fig, 5 ref.

Descriptors: *Statistical methods, *Probability, *Forecasting, *Droughts, Digital computers, Estimating, Least squares method, Frequency analysis.
Identifiers: Gumbel's method, Fibonacci search.

Estimation of the parameters of Gumbel's third asympototic distribution of the smallest value has been accomplished in the past by the following methods: (1) the method of moments; (2) using an order statistic on the characteristic drought; and (3) using the smallest observed drought. These three methods are compared with a fourth method that uses sequential least squares and a Fibonacci search. Based on estimates of the parameters of 44 rivers in the United States, it appears that methods 1, 2, and 3 do not give a satisfactory estimate of the smallest frought in a large number of cases. The method of using an order statistic was the least successful. The use of the least squares and Fibonacci search approach gave more acceptable estimates than the other methods. (Knapp-USGS)

AN ANALYSIS OF RUNS OF PRECIPITATION EVENTS,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
Edward H. Wiser.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 34, p 258-267, 1967. 10 p, 4 fig, 2 tab, 7 ref.

Descriptors: *Precipitation (Atmospheric), *Forecasting, *Statistical methods, *Markov processes, Stochastic processes, Probability, Monte Carlo method, Mathematical models.
Identifiers: Runs of data.

Simulation of precipitation records requires information about patterns of events. One useful characteristic is the number of runs of events or nonevents of any length. Equations presently available for standard models apply for an infinite series of draws, and data must be obtained carefully in order to fit the models. Exact equations are presented for the number of runs in a specified duration for a wide class of models, including the Bernoulli and Markov models as special cases. Equations are given for the number of runs of any length, for the total number of runs, and for the total number of events. The effects of analyzing runs over a limited time period is readily obtained. Examples are given of analyses of hourly events, showing the marked effect of persistence over short time periods. The inadequacy of standard models in describing the data is clearly demonstrated, and another model is used which more adequately accounts for the effect of persistence. (Knapp-USGS)

ADAPTIVE FILTERS FOR TREND EXTRAPOLATION OF RUNOFF RECORDS,
Deutsche Akademie der Wissenschaften zu Berlin (East Germany). Inst. for Physical Hydrography.
Otto Czepa.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 50, p 384-388, 1967. 5 p, 1 fig, 1 ref.

Descriptors: *Streamflow forecasting, *Time series analysis, Statistical methods, Probability, Data processing, Frequency analysis.
Identifiers: Data filters, Moving average methods.

To estimate the oscillatory fluctuations of a time series with a given constant period (e.g. the seasonal with a period of P = 12 mon) we would want to limit frequencies. Exponentially weighted moving averages are filters which will give a reasonably good approximation for this purpose. The gain factor of weighted moving average filters and recursion formulas for numerical smoothing and extrapolation are discussed. (Knapp-USGS)

DETERMINING AND MAPPING THE AVERAGE HYDROLOGIC RESPONSE OF EASTERN UNITED STATES,
Franklin Coll. of Arts and Sciences, Athens, Ga.
James F. Woodruff, and John D. Hewlett.
Available from the Clearinghouse as PB-189 524, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Franklin College of Arts and Sciences and School of Forest Resources, University of Georgia, Athens, Georgia. Dec 1969. 33 p. OWRR Project A-013-GA.

Descriptors: *Hydrologic mapping, *Hydrologic properties, *Direct runoff, *Synoptic analysis, *Hypsometric analysis, *Terrain analysis, Streamflow, Storm runoff, Base flow, Peak flow, Hydrologic data, Hydrologic cycle, Hydrograph analysis, Regression analysis, Watersheds, Precipitation data, Gaging stations, Topography, Maps.

An attempt was made to predict the average annual basin hydrologic response of ungaged watersheds in the East by regression against 15 planimetric, hypsometric and land use factors available on 90 test basins varying in size from 2 to 100 square miles. Using topographic, hydrologic, and precipitation data available regression coefficients developed relating response to basin factors proved entirely non-significant Studies revealed that the part of a basin's annual precipitation that will become flood waters cannot be predicted from available morphometric data on basins because response is controlled chiefly by porous mantle factors not measurable on normal data sources A hydrologic response map of Eastern United States plotted directly from streamflow and precipitation records for 201 basins ranging up to 200 square miles indicated that the average basin response corresponded with the main geological provinces of the East. By revealing specific regions of high flood-producing potential, the map proves that the synoptic response ratio is a meaningful parameter. The authors suggest that the best way to map response may be to measure precipitation and streamflow by cheap, short-term methods traditionally regected as uneconomical. The report contains 16 references. (Conway-Georgia Tech)

COMPUTER STUDIES OF FINITE-AMPLITUDE WATER WAVES,
Stanford Univ., Calif. Dept. of Civil Engineering.
Robert K. C. Chan, Robert L. Street, and Theodor Strelkoff.
Available from the Clearinghouse as PB-189 522, $3.00 in paper copy, $0.65 in microfiche. Technical Report No 104, June, 1969. 97 p, 4 tab, 39 fig, 36 ref. ONR Contract Nonr 225 (71) NR 062-320 and National Science Foundation Grant GK 2506. OWRR Project B-037-CAL.

Descriptors: *Waves (Water), *Digital computer.
Identifiers: *Solitary wave, *Finite differences.

Two numerical techniques are utilized to study the motion of two-dimensional, finite-amplitude water waves by using an electronic digital computer. The nonlinear properties of water waves are of primary interest. The first part of the work introduces the Stanford-University-Modified MAC (SUMMAC) code which is proposed as a valid tool for analyzing incompressible, viscous flows with a free surface under transient conditions. The method is applied to the study of the solitary wave run-up on a vertical wall. The results are compared with the available experimental data and give a much better prediction of the wave run-up than the existing analytic theory. In the second part, Newton's process of successive corrections is applied to solve steady-state potential flows with free surface and gravity. A specific application to the analysis of solitary waves is made and all the wave characteristics are in excellent agreement with experiments.

TUNNELLING METHODS IN HUNGARY,
Technical Univ., of Budapest (Hungary).
C. J. Szechy.
Tunnels Tunnelling, Vol 1, No 3, p 131-133, Sept-Oct, 1969. 3 p, 7 fig.

Descriptors: *Tunnel construction, *Tunneling, Tunnel linings, Tunnels, Geologic formations, Geology, Foreign construction, Alinements, Waterproofing, *Engineering geology, Geologic investigations, Underground structures.
Identifiers: Tunnel inverts, Tunnel supports, Hungary, Budapest (Hungary), *Subways, Subsurface openings.

While the general location of a tunnel is governed by direct traffic and transportation demands, the exact location and method of construction are subject to geological circumstances. How far the geological picture, combined with the possibilities of a relatively free access from the surface, may influence the construction method is illustrated with a description of the special construction features

used in building the east-west line of the new Budapest underground railway. A wide range of tunneling methods was used. Special combined techniques were necessary in constructing deep-level stations, shield-chambers, ventilation shafts, and other adjoining underground facilities. (USBR)

DISTRIBUTION OF CONCENTRATED LOADS ON ORTHOTROPIC BRIDGE DECKS,
Dundee Univ. (Scotland).
A. R. Cusens, and R. P. Pama.
Struct Eng, Vol 47, No 9, p 377-385, Sept 1969. 9 p, 11 fig, 10 ref.

Descriptors: *Bridges, Plates, Slabs, *Load distribution, Computer programs, Equations, Mathematical analysis, Series (Mathematics), Stress distribution, *Bridge design, Structural analysis, Structural engineering, Experimental data.
Identifiers: *Orthotropic bridges, *Concentrated loading, Computeraided design, Comparative studies, *Bridge decks.

A general method based on a series solution of the orthotropic plate equation is presented for analyzing the distribution of concentrated loads in right orthotropic bridge decks. The method is compared to the widely adopted Guyon-Massonnet quasi-slab analysis devised before digital computers were used in structural design and necessarily embodied a number of approximations and limitations. The method is valid over a wider range than the Guyon-Massonnet analysis, and experimental evidence indicates better accuracy, particularly in computing longitudinal moments.

DRAINAGE MASTER PLAN FOR THE CITY OF FORT WORTH PUBLIC WORKS DEPARTMENT, STORM DRAINAGE CRITERIA AND DESIGN MANUAL.
Knowlton-Ratliff-English, Fort Worth, Tex.

Fort Worth, Knowlton-Ratliff-English, Consulting Engineers, 1967. 74 p, 25 tab, 63 fig, 14 ref.

Descriptors: *Drainage engineering, *Design criteria, *Drainage programs, *Drainage practices, *Storm runoff, *Surface drainage, *Storm drains, *Flood control, Rainfall-runoff relationships, Hydrology, Hydraulic structures, Hydraulics, Intakes, Open channels, Storage, Culverts.
Identifiers: *Fort Worth, *Drainage master plan, *Gutter flows, Nomographs, Coding.

The purpose of this drainage manual is to establish standard criteria, principles, procedures, and practices for the design of storm drainage facilities within the City of Fort Worth, Texas. The manual constitutes the first phase of the development of a master plan for storm drainage to guide the design and construction of storm sewers and channels in the City and its anticipated growth area. The manual is presented in nine sections that give logical development to the solution of storm drainage problems. The introductory section covers definitions and abbreviations, code designation of drainage system elements and the degree of protection afforded. Other sections cover: determination of design discharge; flow in gutters; storm drain inlets; flow in storm drains; closed storm drainage systems; design of open channels; design of culverts; and appendices which include a glossary of terms, bibliography, and tables and suggested computation forms. Many nomographs are included to facilitate solutions to various engineering computations involved in drainage design. Tables are included presenting suggested values of design parameters for various conditions and circumstances. Relationships between rainfall and runoff, and the use of the Rational and Unit Hydrograph methods of runoff computation are included. (See also W70-03815 thru W70-03818). (Poertner-Chicago)
W70-03814

SECTION I, INTRODUCTION; SECTION II, DETERMINATION OF DESIGN DISCHARGE; SECTION IX, APPENDIX.
Knowlton-Ratliff-English, Fort Worth, Tex.

In: Drainage Master Plan for the City of Fort Worth Public Works Department, Storm Drainage Criteria and Design Manual, Knowlton-Ratliff-English Consulting Engineers, Fort Worth, 1967. 19 p, 9 tab, 5 fig.

Descriptors: *Drainage engineering, *Design criteria, *Watersheds, *Time of concentration, *Runoff coefficient, *Rainfall-runoff relationships, *Hydrology, Surface drainage, Storm runoff, Bibliographies.
Identifiers: *Fort Worth, *Drainage master plan, *Glossary of drainage terms, Drainage computation forms.

Section I is an introduction explaining the purpose and arrangement of the manual. Division of the urban area into defined watersheds, drainage areas, and drainage sub-areas and a system of coding these elements of the drainage system are also presented. Section II, entitled 'Determination of Design Discharge sets forth six conditions which should govern the design of a storm drainage system. This section also treats methods for determining the amounts and rates of runoff using the Rational Method and the Unit Hydrograph Method. The Rational Method is specified for watershed areas up to 1,000 acres. Above this area, computations using both methods are specified and the greater discharge is to be used for design of the elements of the system. The use of planimetric-topographic maps of the area is recommended for determining the size and shape of watersheds. Typical runoff coefficients and graphs of rainfall intensity vs. duration and frequency are included as being representative of the Fort Worth area. A nomograph for computing 'time of concentration' is presented. Section IX constitutes an appendix which includes a glossary of terms, bibliography, and forms for use in making engineering computations. (See W70-03814). (Poertner-Chicago)
W70-03815

SECTION III, FLOW IN GUTTERS; SECTION IV, STORM DRAIN INLETS.
Knowlton-Ratliff-English, Fort Worth, Tex.

In: Drainage Master Plan for the City of Fort Worth Public Works Department, Storm Drainage Criteria and Design Manual, Knowlton-Ratliff-English, Consulting Engineers, Fort Worth, 1967. 56 p, 38 fig.

Descriptors: *Gutter flows, *Intakes, *Drainage engineering, *Storm runoff, *Surface drainage, *Hydraulic structures, Hydraulics, Drainage engineering, Design criteria, Drainage practices, Storm drains.
Identifiers: *Fort Worth, *Gutter flows, *Street flows, *Inlets, *Inlet design, *Inlet capacity, Nomographs, Drainage design computations, Computation aids.

Section III presents information, a nomograph, and curves to facilitate making computations required in designing the various hydraulic properties of street gutters and roadway ditches. The nomograph and curves greatly simplify the otherwise complicated solutions for depth of flow of drainage runoff in gutters and the lateral spread of the water into traffic lanes. The nomograph and figures, which are graphical solutions of Manning's Equation for uniform flow, are developed for streets of different widths and roughness coefficients, and for streets with straight cross slopes and others with various size parabolic crowns. Section IV presents sketches, criteria and examples to illustrate design procedures, standards and techniques for determining hydraulic capacities and required dimensions of storm drain inlets. Three major classifications of inlets are treated; namely, (1) inlets in sumps, (2) inlets on grade without gutter depression, and (3) inlets on grade with gutter depression. Curves and computation forms are included to simplify solutions of the complicated mathematical formulas. (See W70-03814). (Poertner-Chicago)
W70-03816

SECTION V, FLOW IN STORM DRAINS AND THEIR APPURTENANCES; SECTION VI, DESIGN OF CLOSED STORM DRAINAGE SYSTEM; SECTION VII, DESIGN OF OPEN CHANNELS.
Knowlton-Ratliff-English, Fort Worth, Tex.

In: Drainage Master Plan for the City of Fort Worth Public Works Department, Storm Drainage Criteria and Design Manual, Knowlton-Ratliff-English, Consulting Engineers, Fort Worth, 1967. 29 p, 7 tab, 6 fig.

Descriptors: *Drainage engineering, *Design criteria, *Hydraulic design, *Pipe flow, *Closed conduit flow, *Storm drains, *Open channel flow, Hydraulics, Channel flow, Concrete pipes, Metal pipes, Hydraulic structures, Drainage systems, Mannings equation, Joints, Head loss, Hydraulic gradient, Roughness coefficient.
Identifiers: *Fort Worth, *Drainage systems design, Drainage master plan.

Section V presents criteria, procedures, formulas and roughness coefficients for use in designing the hydraulic elements of storm drains and appurtenances to storm drainage systems. A minimum mean flow velocity of 2.5 ft. per sec. is specified, as are minimum grades for various sizes of concrete pipe and corrugated metal pipe. Charts for facilitating hydraulic computations based upon the Continuity Equation and Manning Formula are included. Tables of design coefficients are included for calculating head losses at inlets, manholes, junctions, bends, obstructions and size changes. The hydraulic grade line is required to be 2 ft. or more below ground or streets. Section VI presents the overall drainage system design procedure, step-by-step, applying the criteria, techniques, formulas, coefficients and charts presented in the preceding sections of the manual. Section VII presented criteria, formulas, roughness coefficients and procedures for designing the hydraulic elements of lined and unlined open channels, rectangular and trapezoidal in cross-section, and natural ditches. The Manning Formula is the basis of design. (See W70-03814). (Poertner-Chicago)
W70-03817

SECTION VIII, DESIGN OF CULVERTS.
Knowlton-Ratliff-English, Fort Worth, Tex.

In: Drainage Master Plan for the City of Fort Worth Public Works Department, Storm Drainage Criteria and Design Manual, Knowlton-Ratliff-English, Consulting Engineers, Fort Worth, 1967. 34 p, 3 tab, 14 fig.

Descriptors: *Culverts, *Drainage engineering, *Drains, *Outlet works, *Hydraulic design, *Storm drains, *Storm runoff, *Surface drainage, *Design criteria, Hydraulic structures, Pipes, Roads, Hydraulics, Drainage practices, Concrete pipes, Metal pipes, Head loss, Roughness coefficient.
Identifiers: *Fort Worth, *Highway culvert design, *Highway drainage, Box culverts, Pipe culverts, Culvert sizing, Nomographs.

Section VIII defines the functions of drainage culverts, presents design criteria, establishes the method of flow determination and sets forth design formulas, coefficients and procedures for sizing various types of culverts. It is specified that the quantity of flow shall be determined by the Rational Method or the Unit Hydrograph Method. All designs are to be based on a 50 year storm frequency. 'Entrance loss' coefficients are specified for culverts constructed of concrete pipe, corrugated metal pipe and concrete box-sections--all with varying headwall end wall, and wingwall designs. Formulas are specified for hydraulic computations under various culvert flow depths and various degrees of submergence at the entrance and inlet.

Seven examples of culvert sizing computations are presented. Nomographs are included for use in simplifying computations associated with the hydraulic design of culverts. Their use is illustrated in conjunction with the presentation of the design examples. (See W70-03814). (Poertner-Chicago)

NUMERICAL SIMULATION OF WITHDRAWAL FROM A STRATIFIED RESERVOIR,
Oregon State Univ., Corvallis, Oreg.
H. T. Mercier, M. D. Terry, and L. S. Slotta.
ASCE National Water Resources Engr Meeting, Memphis, Tenn, Jan 26-30, 1970. 16 p, 5 fig.

Descriptors: *Mathematical models, *Density currents, Density stratification, Numerical analysis, Computer models, Reservoirs, Density.

Modifications are presented to the MAC method for the flow of a non-homogeneous, viscous, incompressible fluid and summaries are compiled for numerical investigations of withdrawal from a density stratified reservoir. The equations of motion were developed from the system of the partial differential equations of incompressibility, continuity and the Navier-Stokes equation. Those equations were solved numerically by finite difference techniques. The research procedure was to simulate a reservoir and investigate the effects of viscosity variation, density stratification, and the presence of a submerged ridge on the flow pattern. Both the continuous and the two-layered models were used. The computation was made on a CDC 6600 computer. (Novotny-Vanderbilt)

BEHAVIOR OF BUOYANT JET IN CALM FLUID,
Hydraulics Research Station, Wallingford (England).
Habib O. Anwar.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 95, No HY4, Proc Paper 6688, p 1289-1303, July 1969. 10 fig, 13 ref.

Descriptors: *Jets, *Outlet, *Hydraulics models, *Mixing, *Buoyancy, Diffusion, Turbulence.

The investigation studied the turbulent mixing that occurs when sewage is discharged into the sea from a deeply submerged outlet, which is the case when the buoyancy forces dominate the largest part of the rising plume. The investigation was carried out by discharging freshwater from circular nozzles of 1/2 inch and 1 inch diameter, into a quiescent ambient fluid of greater density. The ambient fluid was salt solution of uniform density. The density at points in the plume was determined by measuring the concentration of the solution using an electrical conductivity probe. Conclusions were (1) it was found that the density distribution across the plume is almost Gaussian, (2) the motion in the rising plume is similar to convection over a heated source when the nozzle densimetric Froude number is low, and (3) it has been found that the results are similar to those given by Fan and Abraham and also satisfactory agreement has been found between calculations and experimental results. These calculations were made neglecting initial jet momentum and treating the plume as purely buoyant. Comparison with results of work by Frenkel and Cummings proved unsatisfactory. (Guerrero-Vanderbilt)

DIFFUSION AND ENTRAINMENT IN TWO-LAYER FLOW,
Norges Tekniske Hoegskole, Trondheim. River and Harbor Lab.
T. Carstens.
Journal of the Waterways and Harbors Division, Proceedings of the ASCE, Vol 96, No WW1, Proc Paper 7081, p 97-104, Feb 1970.

Descriptors: *Water pollution, *Salinity, *Turbulence, *Diffusion, Harbors.
Identifiers: *Entrainment.

A layer of freshwater overriding a pool of seawater may extract salt from the pool of two mechanisms: (1) Diffusion; and (2) entrainment. While diffusion is a two-way transport by which equal volumes are exchanging places, entrainment is a one-way, advectival type of transport. The rates of the two vertical transports depend on the turbulence in the surface layer and in the pool. The more turbulent water mass will erode the less turbulent one and entrain it. On two occasions fluxes of water and salt past two vertical cross sections of the surface layer were measured in a fjord. In one case there was only about 10% entrainment between the two sections, in the other about 100%. (Guerrero-Vanderbilt)
W70-03728

UNIFIED VIEW OF DIFFUSION AND DISPERSION,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Edward R. Holley.
Journal of the Hydraulics Division, Proceedings of the ASCE, Vol 95, No HY2, Proc Paper 6462, p 621-631, Mar 1969.

Descriptors: *Dispersion, *Diffusion, *Convection, Mixing.
Identifiers: Diffusion coefficient, Dispersion coefficient, Longitudinal dispersion.

The similarities among the various types of diffusion and dispersion are discussed. Diffusion and dispersion are basically convective transport mechanisms. The method chosen for representing the convection in a mass balance equation is the determining factor in deciding whether diffusion or dispersion must be included in the conservation equation for a given flow. This principle is illustrated for molecular diffusion, turbulent diffusion, and longitudinal dispersion. In a given flow, the relative importance of diffusion or dispersion in different transport problems depends on the steepness of the concentration gradient. It is proposed that the term 'diffusion' be reserved for transport that is associated primarily with time-averaged velocity fluctuations and that 'dispersion' be used for transport associated primarily with the spatial average of velocity variations. (Guerrero-Vanderbilt)
W70-03729

MOTION OF TWO DIMENSIONAL STARTING PLUME,
Waterloo Univ. (Ontario). Dept. of Mechanical Engineering; and New South Wales Univ., Kensington (Australia).
Gee Tsang, and Ian R. Wood.
Journal of the Engineering Mechanics Division, Proceedings of the ASCE, Vol 94, No EM6, Proc Paper 6321, p 1547-1561, Dec 1968. 10 ref, 6 fig.

Descriptors: *Dimensional analysis, *Density, *Stratified flow, Velocity, Buoyancy.
Identifiers: *Plumes.

A motion study was made of a two dimensional starting plume with the emphasis on looking for a stream function for the surrounding fluid. Dimensional analysis is used to show that the shape and velocity distribution of the plume when expressed in a dimensionless form is a constant and that the ratio of the velocity of the leading edge to the third power of the flux of density difference times the gravitational constant from the line source is a constant, C. Experiments in which velocities were measured with neutrally buoyant particles were carried out showing that the plume consisted of a cylindrical cap and a wedge shaped tail and that the ratio of the radius of the cylinder to the total length of the plume, n, was approximately one third. The value of C was 1.20 with a standard deviation of 0.03. A model in which the cap is treated as a solid moving cylinder was used to obtain a relationship between C and the rate of spread. A distribution of doublets, sources, and sinks was found which defined the flow field outside the vorticity-containing region. (Guerrero-Vanderbilt)
W70-03731

JET INDUCED CIRCULATION AND DIFFUSION,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
Constantin Iamandi, and Hunter Rouse.
Journal of the Hydraulics Division, ASCE, Vol 95, No HY2, Proc Paper 6446, p 589-601, Mar 1969. 8 fig, 6 ref.

Descriptors: *Bubbles, *Diffusion, *Circulation, *Jets, Turbulent flow.

Patterns of mean flow and turbulence for various jet boundary configurations were determined. Tests were conducted in an air duct to determine the patterns of mean flow and turbulence produced by a jet emerging along an edge of the duct parallel to one of the duct walls. The parameters that have been varied include the relative proportions of the duct and a nondimensional grouping of the momentum characteristics of the jet. It has been concluded that: (1) Submerged jets provide an alternative (and even more adaptable) means of maintaining the pattern of flow for which a bubble screen is often utilized; (2) the generalized characteristics of the measured mean-flow and turbulence fields are subject to use in design over a considerable range of scales and operational conditions; and (3) until such time as similar studies have been carried out for bubble screens, an approximate method is at hand for comparing their effectiveness in terms of the information for jets presented herein. (Guerrero-Vanderbilt)

WATER-HAMMER ATTENUATION WITH A TAPERED LINE,
Youngstown State Univ., Ohio; Carnegie-Mellon Univ., Pittsburgh, Pa.
F. J. Tarantine, and W. T. Rouleau.
Trans Amer Soc Mech Eng, Ser D--J Basic Eng, Vol 91, No 3, p 341-352, Sept 1969. 12 p, 15 fig, 11 ref, 3 disc.

Descriptors: *Water hammer, Surges, Hydraulics, *Attenuation, *Valves, Pressure, Theoretical analysis, Experimental data, *Closing, Time, Sonic waves, Velocity, Mathematical models, *Tapers, Vibrations, Reynolds number.
Identifiers: Surge waves, Test results, Wave propagation.

Pressure attenuation that can be obtained through application of a rigid tapered section located immediately upstream of a quick-closing valve or other surge-generating device was investigated. The model used was an inviscid liquid flowing through a rigid, tapered tube terminated by either a very long, uniform line or a finite-length line and reservoir. An outline of a theoretical method for solving the problem and some practical solutions are presented. A description of the experimental procedure used to validate the analytical approach and assumptions used in the analysis are given. Results of experimental determinations are compared with theoretical water-hammer calculations. Inserting a tapered section at the valve end of a long, uniform line delayed the normal pressure rise associated with water hammer. Because of the time delay, a tapered section at the valve can reduce effectively the pressure surge resulting from quick closing-reopening or opening-reclosing of the valve. (USBR)

8C. Hydraulic Machinery

UNIT SPACING OF HYDROELECTRIC MACHINES,
English Electric Co. Ltd., Whetstone.
E. G. Taylor.
Water Power, Vol 21, No 10, p 377-380, Oct 1969. 4 p, 5 fig, 6 ref.

Descriptors: *Hydroelectric plants, *Structural design, Velocity, Dimensions, *Francis turbines, *Hydraulic turbines, Pressure head, Specific speed, *Electric generators, Graphical analysis, Hydroelectric power, Turbine runners, Foreign research, Design, Spiral cases, Stators, *Powerhouses.
Identifiers: *Spacing, Great Britain, Turbine head covers.

Designing a hydroelectric installation requires preliminary information concerning the generator and turbine. Some problems arising are: (1) the required value of fly-wheel effect--the energy constant and related speed rise and pressure rise; (2) the ability of turbine head cover to pass in one piece through the generator stator bore; and (3) dimensions of the generator air housing and spiral casing to determine whether the generator or the spiral casing dimensions fix the unit spacing. Equations are expressed as curves so that by knowing the power required and the rated head of the unit, generator and turbine dimensions and unit spacing can be solved graphically. The graphs given were derived for Francis turbines; similar graphs can be constructed for other types of turbines by using this method. From the various graphs, generator and turbine dimensions are derived; applying these dimensions to a unit spacing graph provides dimensions for the hydroelectric powerplant design. (USBR)

COMPARISON OF PILE LOAD-TEST-SKIN-FRICTION VALUES AND LABORATORY STRENGTH TESTS,
Saskatchewan Univ., Saskatoon; and Sir George Williams Univ., Montreal (Quebec).
W. G. Watt, P. J. Kurfurst, and Z. P. Zeman.
Can Geotech J, Vol 6, No 3, p 339-352, Aug 1969. 14 p, 11 fig, 1 tab, 7 ref.

Descriptors: *Piles (Foundations), Pile friction, Foreign research, Pile bearing capacities, Pile foundations, Concrete piles, Direct shear, Skin friction, *Laboratory tests, Van shear tests, Shear strength, Soil tests, Soil engineering, Soil mechanics, Test procedures, *Friction piles, *Field tests.
Identifiers: *Pile tests, *Cast-in-place piles, Loading tests, Test piles, *Comparative studies, Saskatchewan (Canada), In situ tests.

Three full-scale bored, cast-in-place concrete piles constructed to give no-tip resistance were loaded to failure using the equilibrium method of loading. Each pile was 24 in. in diameter, but of different length, stopping in turn in strata of partly saturated highly plastic clay, saturated silty clay, and till. Ultimate skin friction values were calculated and compared to direct shear tests and laboratory and field vane tests, giving values of undrained shear strength. Large variations were present in shear strength results even at the same depth in adjacent holes. Comparison of vane tests on soil samples and on the surface of the bored hole showed the disturbance caused by drilling to be negligible for these soils. Results from an interfacial friction device lowered into the hole indicated that the skin friction increased with lateral stress and that the lateral pressure on the concreted piles at the time of testing was less than 10 psi. (USBR)

Identifiers: Exchangeable sodium percentage, *Piping (Erosion), Flagstaff Gully Dam (Tasmania), Australia, Peptization.

Deflocculation of the sodium-rich clay core may have contributed substantially to the piping failure of Flagstaff Gully Dam in Tasmania, shortly after first filling. Conditions for such a failure exist when water of low salinity flows through a clay soil having a high exchangeable sodium percentage at a velocity exceeding the swelling rate of the soil, resulting in salt leaching, deflocculation, and removal of soil at an ever-accelerating rate. When flow velocity is less than the swelling rate, salt leaching occurs at an ever-diminishing rate, flow channels seal off gradually by swelling, and the soil is progressively stabilized against seepage. Conclusions from observations of installations to monitor the reconstructed embankment of Flagstaff Gully Dam are presented. Initial installations showed that the potential hazard of clay deflocculation was present and could become acute in a short time. Additional installations showed that a low rate of permeability precluded an immediate hazard and ensured long-term core stability. Dissipation of construction pore pressures is extremely slow and final equilibrium will not be reached for at least 15 yr after construction. (USBR)

ON THE EFFECTIVENESS OF SAND DRAINS,
Harvard Univ., Cambridge, Mass.
L. Casagrande, and S. Poulos.
Can Geotech J, Vol 6, No 3, p 287-326, Aug 1969. 40 p, 39 fig, 22 ref.

Descriptors: Drains, Drainage wells, Soil mechanics, Drainage, Soil physical properties, Soil properties, Soil strength, Consolidation, *Foundations, Peat, Relief wells, Effects, Settlement (Structural), Clays, Organic soils, Shear strength, Permeability, Pore pressure, Bibliographies, *Vertical drains, Field tests, *Sand drains.
Identifiers: Drain holes, Drain spacing, Soil characteristics, In situ tests, Comparative studies, Secondary consolidation, Compressible soils.

Detrimental effects of driving sand drains in sensitive soils are discussed. Several case records of the behavior of embankments on such soils are analyzed. If careful foundation investigation indicates the desirability of increasing the rate of primary consolidation, non-displacement sand drains should be installed with minimum disturbance to the surrounding soil. Sand drains of any type are of little or no value in soils exhibiting substantial secondary settlements. Proper design of nondisplacement sand drains systems must be based on a careful study of an adequate number of undisturbed soil specimens in the partly dried condition and on in situ horizontal permeability tests, in addition to the classification, strength, and consolidation tests normally performed. Identifiers: Pressure transducers, Unsaturated soils, Undrained tests, Triaxial tests, Drained tests, Great Britain.

Principles involved and methods used for making field measurements of pore pressure in saturated and unsaturated soils are discussed. Topics are suggested on which discussion and additional data would be useful for interpreting and assessing accuracy and long-term reliability of field measuring systems. Three classes of laboratory problems in measuring pore pressures are discussed: (1) undrained tests--pore pressure is uniform throughout the sample, but varies with time; (2) consolidation tests and pore pressure dissipation tests--controlled boundary drainage results in pore pressure gradients in the sample; and (3) model tests--undrained pore pressure is nonuniform. 8E. Rock Mechanics and Geology

GEOLOGY OF FLAMING GORGE DAM AND RESERVOIR,
Bureau of Reclamation, Salt Lake City, Utah.
J. Neil Murdock.
Intermount Ass Geol, 16th Annu Field Conf, p 23-32, 1969. 10 p, 3 fig, 4 ref.

Descriptors: *Engineering geology, *Geologic investigations, Drill holes, Dam foundations, *Damsites, Concrete dams, Arch dams, Shales, *Foundation investigations, Abutments, Seepage, Keyways, Diversion tunnels, Cutoffs, Anchors, Grouting, Grout curtains, Landslides, Reservoirs, Reservoir sites, Rock foundations.
Identifiers: Percolation tests, Seepage control, Flaming Gorge Dam (Utah), Flaming Gorge Reservoir (Utah).

The geology of Flaming Gorge Dam and Reservoir is described and some related problems in design and construction are discussed. Preliminary exploration indicated that the general quality of the rock was excellent, but because of faults, joints, and clay seams, extensive geological investigations and mapping were required to obtain sufficient information for the final design of the dam and appurtenant structures. Diamond drill coring, seismic studies, and drill hole percolation tests were performed. Some problems anticipated were seepage, extra excavation to reach sound rock, and pinning of certain areas to prevent possible movement. The seepage problem was relatively minor, requiring extension of the main cutoff grout curtain deeper

into both abutments. Abutment rock was pinned to assure stability and to prevent rockfalls. Shale seams in the keyway areas were treated by placing concrete cutoff walls in the shale beds at the heel and toe of the dam. As the reservoir was filled for the first time, several small slumps occurred in slopes along the sides of the reservoirs. One movement of a large block of rock presented a potential hazard to boaters and is under careful observation. At the present time, the landslide areas are not considered hazardous. (USBR)

THE PROBLEMS ON TUNNEL EXPLORATION,
Bureau of Reclamation, Denver, Colo.
Charles E. Hall.
Proc 7th Annu Eng Geol Soils Eng Symp, p 3-8, Moscow, Idaho, Apr 1969. 6 p.

Descriptors: *Engineering geology, Geologic investigations, Subsurface investigations, *Tunnels, Tunnel construction, Tunneling machines, Bids, Tunnel design, *Geologic mapping, Geologic control, Geophysics, Contract administration, Claims (Contracts), Exploration, Reconnaissance surveys, Helicopters, Alinements.
Identifiers: Geologic defects, Geophysical prospecting, Seismic refraction.

In recent tunnel projects, design engineers have been requesting detailed geologic information and interpretation of the effects of geologic structure on construction. Bureau of Reclamation programs now call for surface geologic mapping on a scale of 2000 ft to the inch for 4 or 5 mi either side of the alinement, and detailed mapping along the alinement on a scale of 400 ft to the inch. Field mapping is best performed on aerial photographs and then projected to either a planimetric base or a topographic base. Concentrating on engineering rock properties to place the engineering characteristics of a particular rock directly on the geologic map is most desirable, rather than to concentrate on classical geologic properties and names of formations. Detailed alinement mapping is followed by geophysical investigations and confirmed by drilling wherever time, money, and access permit. Access problems on tunnel investigations in relatively inaccessible areas are discussed, and experiences with helicopters are cited. When exploration and design are completed, there is the problem of what to put into the gidding documents for potential bidders; a private opinion is given that owners should provide the factual information and the geological interpretations upon which the design is based. (USBR)

ROCK CUTTING RESEARCH FOR THE DESIGN AND OPERATION OF TUNNELLING MACHINES,
Newcastle-upon-Tyne Univ. (England).
F. F. Roxborough.
Tunnels Tunnelling, Vol 1, No 3, p 125-128, Sept-Oct 1969. 4 p, 8 fig, 8 ref.

Descriptors: Tunnel construction, Rock mechanics, Mining engineering, *Rock excavation, Construction, *Tunneling machines, Experimental data, Compressive strength, Mechanical properties, Research and development, Temperature, Water cooling, *Foreign research, Test procedures, Cutting, Instrumentation, Rocks.
Identifiers: Rock density, Great Britain, Tool design, Test results.

The need for machines capable of driving tunnels in rock has long been recognized by mining engineers. The ease with which coal shearing machines are able to cut through rock intrusions encouraged engineers to explore the possibility of applying the same milling principle to rock cutting machines. Most mechanical rock cutting techniques require the penetration of a wedge into a rock surface, chipping fragments having volumes exceeding that of the tool or wedge. Rock cutting research has lagged behind machine development and application. The untenable situation exists in which machines are being further developed without any appreciation of rock cutting mechanics. Knowledge of the performance characteristics of a cutting tool in rock is essential in designing an efficient cutting system. The University of Newcastle upon Tyne, Great Britain, is undertaking research into the mechanical durability of tool materials for operation in a wide range of rock types from quartz-free limestones to granite. A simple method for assessing the machineability of rock is presented. The principles of full face cutting and of peripheral drum cutting are discussed. (USBR)
W70-03793

A MATHEMATICAL MODEL FOR PIT SLOPE STABILITY,
Arizona Univ., Tucson.
D. J. Hammel.
Quart Colo Sch Mines, Vol 64, No 3, p 53-69, July 1969. 17 p, 11 fig, 4 tab, 1 ref.

Descriptors: Rock mechanics, Engineering geology, *Rockslides, Slopes, Rock excavation, *Slope stability, Quarries, *Quarrying, Mathematical analysis, *Pits, Cut slopes, Regression analysis, Statistical analysis, Correlation analysis, Correlation techniques, Mathematical models.
Identifiers: *Rock slope stability, Variables, Open pit mining.

When a clope failure occurs in construction and mining industries, an engineer is usually called in to determine the cause of the slide. To prevent damages and loss of life from rock slides, rock slope movement must be analyzed prior to failure. A method is given for determining the variables that affect slope movement in an unstable slope and the effect of these variables on slope movement. A sample application of the method is given for an open-pit copper mine in Arizona. First, a case history was developed for an unstable pit slope and then a statistical model of slope movement was developed by multiple correlation and regression analysis. Correlation coefficients were evaluated to select the statistically significant independent variables. Regression analysis predicts slope movement from known values of the independent variables. The best equation for predicting slope movement contained terms for precipitation, mining rate at the toes of the slope, amount of water added to a leach dump near the slope, and water pumped from the pit. Predicted rates of slope movement agreed closely with actual measured values. The statistical model developed is applicable to this particular unstable slope. (USBR)
W70-03794

8F. Concrete

FIELD AND LABORATORY STUDIES OF THE SULPHATE RESISTANCE ON CONCRETE,
Portland Cement Association, Skokie, Ill
G. J. Verbeck
Portland Cement Ass Res Dep Bull 227, p 113-124, Apr 1967. 15 p, 9 fig, 3 tab, 4 ref

Descriptors: *Portland cements, Cements, *Concrete mixes, Field tests, Concretes, *Concrete technology, Concrete testing, Air entrainment, Soil environment, Exposure, Environmental tests, *Durability, Deterioration, Sea water.
Identifiers: *Sulfate-resisting cements, *Sulfate attack, Concrete deterioration, Cement chemistry, Cement content, Concrete properties.

Studies of the sulfate resistance of concrete, conducted by the Portland Cement Association, are part of a long-time study of cement performance in concrete and involve field exposure tests of concrete to sulfate soils and sea water. Field exposure in sulfate soils shows the importance of the tricalcium aluminate content of cement, and the cement content and air content of the concrete. Observed sulfate resistances are compared with the tricalcium aluminate content estimated by 4 different methods. Studies of concrete in warm sea water show that concrete made with cement having a calculated tricalcium aluminate content below 11.2% has performed without deterioration through 25 yr of exposure. High tricalcium aluminate contents may provide some benefit against corrosion of steel when concrete cover is minimal. (USBR)
W70-03796

8G. Materials

FIELD TESTS OF ALUMINUM ORTHOTROPIC BRIDGE DECK,
Aluminum Co. of America, New Kensington, Pa. Alcoa Research Labs.
Maurice L. Sharp.
Proc Amer Soc Civ Eng, J Struct Div, Vol 95, No ST11, p 2463-2476, Nov 1969. 14 p, 16 fig, 3 tab, 3 ref, append.

Descriptors: Aluminum, *Bridges, Deflection, *Field tests, Structural behavior, Loads (Forces), Plates, Static tests, Stress, Stress analysis, Structural members, Structural engineering, Testing, Test procedures.
Identifiers: *Orthotropic bridges, *Bridge decks, Dynamic response, Dynamic loads, Dynamic tests, Loading tests, Static behavior.

Field tests to determine stresses and deflections of an orthotropic aluminum bridge deck caused by a 20-ton truck load are presented. A typical deck panel having a 3/8-in.-thick polyester resin-silica sand wearing surface was instrumented with electrical resistance strain gages and dial gages. Stresses and deflections were determined for 18 different static positions of the truck on the panel. Test values were lower but generally in good agreement with those calculated by AISC design procedures. Dynamic stresses were evaluated for truck speeds up to 20 mph and were about the same as corresponding stresses caused by static load. No measurable vibration of the deck occurred during or after passage of the truck. Lack of significant dynamic effects possibly was caused by a relatively high natural frequency of the deck and damping characteristics of the polyester resin. Transverse stresses in the deck plate with the wearing surface were about 80% of values in a plate without the wearing surface. (USBR)

W70-03734 08B

DIGITAL COMPUTER
COMPUTER STUDIES OF FINITE-AMPLITUDE WATER WAVES,
W70-04009 07C

DIGITAL COMPUTERS
ELECTRICAL ANALOGUES AND DIGITAL COMPUTERS FOR ESTIMATING UNSATURATED WATER FLOW IN SOILS,
W70-03882 02G

DIMENSIONAL ANALYSIS
MOTION OF TWO DIMENSIONAL STARTING PLUMP,
W70-03731 08B

DIPLOGASTERID
DIPLOGASTERID AND RHABDITID NEMATODES IN A WASTEWATER TREATMENT PLANT,
W70-03925 05D

DIRECT RUNOFF
DETERMINING AND MAPPING THE AVERAGE HYDROLOGIC RESPONSE OF EASTERN UNITED STATES,
W70-04008 07C

DISCHARGE MEASUREMENT
AN ERROR MODEL FOR A SINGLE DISCHARGE MEASUREMENT,
W70-03700 02E

DISCHARGE(WATER)
REDUCTION OF ANNUAL RIVER FLOWS TO LONGER PERIODS (RUSSIAN),
W70-03681 02E

CALCULATION OF MAXIMUM DISCHARGES OF CRIMEAN RIVERS (RUSSIAN),
W70-03682 02E

RUNOFF VOLUME AND MAXIMUM DISCHARGES OF SPRING FLOODS APPLIED TO THE UNSTUDIED RIVERS OF KALININGRADSK REGION (RUSSIAN),
W70-03683 02E

AN ERROR MODEL FOR A SINGLE DISCHARGE MEASUREMENT,
W70-03700 02E

DISPERSANT
RELATIVE TOXICITIES AND DISPERSING EVALUATIONS OF ELEVEN OIL DISPERSING PRODUCTS,
W70-03913 05C

DISPERSION
UNIFIED VIEW OF DIFFUSION AND DISPERSION,
W70-03729 08B

RELATIVE TOXICITIES AND DISPERSING EVALUATIONS OF ELEVEN OIL DISPERSING PRODUCTS,
W70-03913 05C

A BREAKTHROUGH IN THE TRACER STUDIES OF SEDIMENTATION TANKS,
W70-03922 05D

DISSOLVED OXYGEN
COMPARISON STUDIES OF WINKLER VS. OXYGEN SENSOR,
W70-03876 05A

USES OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES CHAPTER IV,
W70-03934 05B

DISSOLVED SOLIDS
COMMUNITIES OF OVER 1,000 POPULATION WITH WATER CONTAINING IN EXCESS OF 1,000 PPM OF TOTAL DISSOLVED SOLIDS,
W70-03664 07C

MECHANICS OF THE MOVEMENT OF MOISTURE AND CHEMICAL SUBSTANCES IN SOILS,
W70-03881 02G

DISTILLATION
FRACTIONATION OF TRITIUM AND DEUTERIUM IN SOIL WATER,
W70-03897 02G

DISTRIBUTION
DISTRIBUTION, CHARACTERIZATION, AND NUTRITION OF MARINE MICROORGANISMS FROM THE ALGAE POLYSIPHONIA LANOSA AND ASCOPHYLLUM NODOSUM,
W70-03952 05C

DIURNAL
DIEL AND SEASONAL VARIATIONS IN PHYSIOCHEMICAL LIMNOLOGY, SPEED RIVER, ONTARIO,
W70-03861 02K

DOCKS
FERRIES AND WHARVES.
W70-03755 06E

CITY OF PORT RICHEY V ADAMEK (CONSTRUCTION OF A DOCK EXTENDING INTO A NAVIGABLE RIVER).

HYDRAULIC STRUCTURES
SECTION III, FLOW IN GUTTERS SECTION IV, STORM DRAIN INLETS.
W70-03816 08A

HYDRAULIC TRANSPORTATION
BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES VOLUME III - TECHNICAL ASPECTS OF PIPELINING OF WASTE MATERIALS,
W70-04007 05E

HYDRAULIC TURBINES
UNIT SPACING OF HYDROELECTRIC MACHINES,
W70-03783 08C

HYDRAULICS
BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES VOLUME III - TECHNICAL ASPECTS OF PIPELINING OF WASTE MATERIALS,
W70-04007 05E

HYDRAULICS MODELS
BEHAVIOR OF BUOYANT JET IN CALM FLUID,
W70-03724 08B

HYDROELECTRIC PLANTS
UNIT SPACING OF HYDROELECTRIC MACHINES,
W70-03783 08C

HYDROGEOLOGY
FORMATION AND GEOLOGICAL ROLE OF GROUNDWATERS,
W70-03679 02F

HYDROLOGIC BUDGET
ABOUT THE ANALYTICAL METHOD FOR THE COMPILATION OF THE WATER BALANCE IN AGRICULTURE,
W70-03901 02D

SELECTED ANALYTICAL METHODS FOR WELL AND AQUIFER EVALUATION,
W70-03943 04B

HYDROLOGIC CYCLE
A NUMERICAL MODEL FOR THE HYDROLOGIC TRANSPORT OF RADIOACTIVE AEROSOLS FROM PRECIPITATION TO WATER SUPPLIES,
W70-03698 02A

SUNSPOTS AND HYDROLOGIC TIME SERIES,
W70-03712 02A

WATER TRACING IN THE HYDROLOGIC CYCLE,
W70-03900 02A

HYDROLOGIC DATA
CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO GROUNDWATER STATIONS,
W70-03658 02F

CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO AREAL INVESTIGATIONS AND MISCELLANEOUS ACTIVITIES,
W70-03663 02E

ABOUT THE ANALYTICAL METHOD FOR THE COMPILATION OF THE WATER BALANCE IN AGRICULTURE,
W70-03901 02D

EXTENSION OF RAINFALL RECORDS BY INTERSTATION CORRELATION,
W70-03932 07A

HYDROLOGIC MAPPING
DETERMINING AND MAPPING THE AVERAGE HYDROLOGIC RESPONSE OF EASTERN UNITED STATES,
W70-04008 07C

HYDROLOGIC PROPERTIES
LARGE-SCALE UTILIZATION OF TRITIUM IN HYDROLOGIC STUDIES,
W70-03894 02A

DETERMINING AND MAPPING THE AVERAGE HYDROLOGIC RESPONSE OF EASTERN UNITED STATES,
W70-04008 07C

HYDROLOGIC TIME SERIES
SUNSPOTS AND HYDROLOGIC TIME SERIES,
W70-03712 02A

HYDROLOGY
SECTION I, INTRODUCTION SECTION II, DETERMINATION OF DESIGN DISCHARGE SECTION IX, APPENDIX.
W70-03815 08A

HYDROLOGIC EFFECTS OF RAINFALL AUGMENTATION,
W70-03931 02A

HYPSOMETRIC ANALYSIS
DETERMINING AND MAPPING THE AVERAGE HYDROLOGIC RESPONSE OF EASTERN UNITED STATES,
W70-04008 07C

HYSTERESIS
FIELD MEASUREMENT AND USE OF SOIL-WATER PROPERTIES,
W70-03675 02G

ICE BREAKUP
FRACTURE OF LAKE AND SEA ICE,
W70-03651 02C

ILLINOIS
SELECTED ANALYTICAL METHODS FOR WELL AND AQUIFER EVALUATION,
W70-03943 04B

IMPACT TEMPERATURE
EVAPORATIVE COOLING OF HEATED IRRIGATION WATER BY SPRINKLER APPLICATION,
W70-03718 05D

IMPROVEMENTS
POWERS UNDER CITY MANAGER CHARTER.
W70-03749 06E

INDEPENDENCE

ON INDEPENDENCE POSTULATES CONCERNING CHOICE,
W70-03832 06B

INDIA
VAPOR LOSSES THROUGH SOIL MULCH AT DIFFERENT WIND VELOCITIES,
W70-03808 02G

INDICATORS
THE MYXOBACTERIA TYPE QUOTIENT AS AN INDICATOR OF EUTROPHICATION FOR SURFACE WATERS (IN GERMAN),
W70-03963 02H

INDUSTRIAL LINKAGES
THE IMPACT OF INDUSTRIAL LINKAGES ON GEOGRAPHIC ASSOCIATION,
W70-03835 06B

INDUSTRIAL PRODUCTION
PRODUCTION, CONSUMPTION, AND EXTERNALITIES,
W70-03843 06B

INDUSTRIAL WASTES
MANAGEMENT OF INDUSTRIAL EFFLUENT DISPOSAL IN BRITAIN,
W70-03877 05D

BIODEGRADABILITY AND TREATABILITY OF COMBINED NYLON AND MUNICIPAL WASTES,
W70-03926 05D

INFILTRATION
INFILTRATION INDUCED SOIL INSTABILITIES,
W70-03648 02G

RUNOFF INDUCEMENT IN ARID LANDS,
W70-03809 03B

COMPARISON OF COMPUTED AND MEASURED MOISTURE REDISTRIBUTION FOLLOWING INFILTRATION,
W70-03853 02G

INFILTRATION RATES AS AFFECTED BY DESERT VEGETATION,
W70-03864 02G

THE EFFECT OF SOIL MOISTURE ON INFILTRATION AS RELATED TO RUNOFF AND RECHARGE,
W70-03884 02G

INFRARED RADIATION
THE INFRA-RED DETERMINATION OF QUARTZ IN SEDIMENTS AND SEDIMENTARY ROCKS,
W70-03678 07B

INFRARED TECHNIQUE
THE INFRA-RED DETERMINATION OF QUARTZ IN SEDIMENTS AND SEDIMENTARY ROCKS,
W70-03678 07B

INLET CAPACITY
SECTION III, FLOW IN GUTTERS SECTION IV, STORM DRAIN INLETS.
W70-03816 08A

INLET DESIGN
SECTION III, FLOW IN GUTTERS SECTION IV, STORM DRAIN INLETS.
W70-03816 08A

INLETS
SECTION III, FLOW IN GUTTERS SECTION IV, STORM DRAIN INLETS.
W70-03816 08A

INORGANIC COMPOUNDS
PHYTOPLANKTON NUTRIENT ENRICHMENT EXPERIMENTS OFF BAJA CALIFORNIA AND IN THE EASTERN EQUATORIAL PACIFIC OCEAN,
W70-03949 05C

INPUT-OUTPUT ANALYSIS
RETURNS TO SCALE AND COST CURVES,
W70-03844 06C

INSTITUTIONAL CONSTRAINTS
INSTITUTIONAL FACTORS AFFECTING LAND AND WATER DEVELOPMENT, LOWER RIO GRANDE VALLEY, TEXAS,
W70-03865 06B

INSTRUMENTATION
USER TRIALS OF A SUBMERSIBLE WATER QUALITY RECORDING METER,
W70-03662 05A

A BATTERY POWERED PROPORTIONAL STREAM WATER SAMPLER,
W70-03856 07B

INTAKES
SECTION III, FLOW IN GUTTERS SECTION IV, STORM DRAIN INLETS.
W70-03816 08A

INTERCHANGE
SEDIMENT-WATER NUTRIENT INTERCHANGE,
W70-03980 02H

INTERSTATE COMMISSIONS
TENNESSEE-MISSOURI BRIDGE COMMISSION.
W70-03752 06E

MISSOURI--ILLINOIS BRIDGE COMMISSION.
W70-03753 06E

MISSOURI-ILLINOIS-JEFFERSON-MONROE BRIDGE COMMISSION.

RADIOACTIVITY TECHNIQUES
DEVELOPMENT OF A RADIOISOTOPE GAGE FOR MONITORING SEDIMENT CONCENTRATION IN RIVERS AND STREAMS,
W70-03687 07B

THE APPLICATION OF ISOTOPES TO SOME PROBLEMS IN ATMOSPHERIC SCIENCES,
W70-03690 02B

DIFFUSIOPHORETIC AND THERMOPHORETIC EFFECTS ON PARTICULATE MATTER NEAR CONDENSING AND EVAPORATING WATER SURFACES,
W70-03691 02B

THE ATMOSPHERIC TRANSPORT OF TRITIUM,
W70-03692 02B

HURRICANE TRITIUM I PRELIMINARY RESULTS ON HILDA 1964 AND BETSY 1965,
W70-03693 02B

CONTRIBUTION OF ISOTOPE TECHNIQUES TO THE STUDY OF SOME HYDROLOGICAL PROBLEMS,
W70-03694 02A

THE USE OF RADIOACTIVE TRACER GASES TO STUDY THE RATE OF EXCHANGE OF WATER VAPOR BETWEEN AIR AND NATURAL SURFACES,
W70-03695 02C

APPLICATION OF DEUTERIUM ANALYSES TO THE HYDROLOGY OF THE LAKES OF THE GRAND COULEE, WASHINGTON,
W70-03696 02K

ULTRA-LOW VELOCITY MEASUREMENT IN A STRATIFIED RESERVOIR BY ISOTOPIC CURRENT METER,
W70-03697 02H

A NUMERICAL MODEL FOR THE HYDROLOGIC TRANSPORT OF RADIOACTIVE AEROSOLS FROM PRECIPITATION TO WATER SUPPLIES,
W70-03698 02A

DEVELOPMENT OF ISOTOPE METHODS APPLIED TO GROUNDWATER HYDROLOGY,
W70-03891 07B

GROUNDWATER FLOW AND DIRECTION MEASUREMENT BY MEANS OF RADIOISOTOPES IN A SINGLE WELL,
W70-03892 02F

USE OF CHEMICAL AND RADIOACTIVE TRACERS AT THE NATIONAL REACTOR TESTING STATION, IDAHO,
W70-03893 02F

LARGE-SCALE UTILIZATION OF TRITIUM IN HYDROLOGIC STUDIES,
W70-03894 02A

ENVIRONMENTAL TRITIUM STUDIES AT THE NATIONAL REACTOR TESTING STATION,
W70-03898 05B

RADIOECOLOGY
MARINE RADIOECOLOGY,
W70-03956 05C

RADIOISOTOPES
THE APPLICATION OF ISOTOPES TO SOME PROBLEMS IN ATMOSPHERIC SCIENCES,
W70-03690 02B

THE ATMOSPHERIC TRANSPORT OF TRITIUM,
W70-03692 02B

HURRICANE TRITIUM I PRELIMINARY RESULTS ON HILDA 1964 AND BETSY 1965,
W70-03693 02B

CONTRIBUTION OF ISOTOPE TECHNIQUES TO THE STUDY OF SOME HYDROLOGICAL PROBLEMS,
W70-03694 02A

THE USE OF RADIOACTIVE TRACER GASES TO STUDY THE RATE OF EXCHANGE OF WATER VAPOR BETWEEN AIR AND NATURAL SURFACES,
W70-03695 02C

ULTRA-LOW VELOCITY MEASUREMENT IN A STRATIFIED RESERVOIR BY ISOTOPIC CURRENT METER,
W70-03697 02H

DEVELOPMENT OF ISOTOPE METHODS APPLIED TO GROUNDWATER HYDROLOGY,
W70-03891 07B

GROUNDWATER FLOW AND DIRECTION MEASUREMENT BY MEANS OF RADIOISOTOPES IN A SINGLE WELL,
W70-03892 02F

LARGE-SCALE UTILIZATION OF TRITIUM IN HYDROLOGIC STUDIES,
W70-03894 02A

TECHNIQUES OF GROUNDWATER TRACING USING RADIONUCLIDES,
W70-03896 02F

ENVIRONMENTAL TRITIUM STUDIES AT THE NATIONAL REACTOR TESTING STATION,
W70-03898 05B

WATER TRACING IN THE HYDROLOGIC CYCLE,
W70-03900 02A

RADIOISOTOPES
DESIGN OF A NEUTRON SCATTERING WATER CONTENT GAGE FOR SOILS,
W70-03686 07B

RAIN GAGES
POINT RAINFALL FREQUENCIES IN CONVECTIVE STORMS,
W70-03673 02B

RAINFALL
A MODEL FOR GENERATING SYNTHETIC SEQUENCES OF SHORT-TIME-INTERVAL RAINFALL DEPTHS,
W70-03703 02B

ELEVATION EFFECTS ON RAINFALL NEAR HOLLIS, ALASKA,
W70-03820 02B

RAINFALL DISPOSITION
POINT RAINFALL FREQUENCIES IN CONVECTIVE STORMS,
W70-03673 02B

RAINFALL-RUNOFF RELATIONSHIPS
A MOSAIC TECHNIQUE FOR GENERATING THE DAILY PATTERN WITHIN A SYNTHETIC FLOW SEQUENCE,
W70-03704 02A

CYCLIC FLUCTUATIONS OF VARIABILITY IN HYDROLOGIC PHENOMENA,
W70-03711 02A

RUNOFF INDUCEMENT IN ARID LANDS,
W70-03809 03B

SECTION I, INTRODUCTION SECTION II, DETERMINATION OF DESIGN DISCHARGE SECTION IX, APPENDIX.
W70-03815 08A

A WORKING MODEL FOR THE VARIATION IN STREAM WATER CHEMISTRY AT THE HUBBARD BROOK EXPERIMENTAL FOREST, NEW HAMPSHIRE,
W70-03867 02K

ERRORS IN DISCHARGE ESTIMATES ON MOUNTAIN STREAMS,
W70-03889 02A

THE BAYES METHODS OF STATISTICAL HYDROLOGY (FRENCH),
W70-03906 02A

A PRINCIPAL COMPONENT ANALYSIS OF SURFACE RUNOFF DATA FROM A NEW ZEALAND ALPINE WATERSHED,
W70-03908 02E

APPLICATION OF RUNS TO HYDROLOGIC DROUGHTS,
W70-03909 02E

RANDOM-WALK MODELS
CONSTRAINED RANDOM WALK MEANDER GENERATION,
W70-03866 02E

RATE OF RETURN
INVESTMENT RETURNS BEFORE AND AFTER TAX,
W70-03827 06B

RATES
WASTEWATER RATES AND SERVICE CHARGES IN GREAT BRITAIN,
W70-03875 06E

REAL PROPERTY
DUTIES OF DIRECTOR OF PUBLIC WORKS REGARDING SWAMP LANDS.
W70-03740 06E

RECREATION
COUNTY FISHING LAKES AND RECREATION GROUNDS.
W70-03745 06E

TOWN OF PALM BEACH V CARTER (PROHIBITION OF SURFING WITHIN TOWN LIMITS FOUND CONSTITUTIONAL).
W70-03764 06E

MISSOURI FEDERAL WATER PROJECTS RECREATION FUND.
W70-03771 06C

LIABILITY OF LANDOWNER TO PERSONS USING LAND.
W70-03779 06E

RECLAIMED WASTEWATER FOR SANTEE RECREATIONAL LAKES,
W70-03950 05D

RECREATION DEMAND

FLORIDA'S LAKES (RIGHTS IN LAKES),
W70-04016 06F

RECREATION FACILITIES
COUNTY FISHING LAKES AND RECREATION GROUNDS.
W70-03745 06F

RECLAIMED WASTEWATER FOR SANTEE RECREATIONAL LAKES,
W70-03950 05D

REGIME
MOBILE-BED FLUVIOLOGY,
W70-03669 02J

REGIONAL ANALYSIS
THE OPTIMALITY OF LOCAL SUBSIDIES IN REGIONAL DEVELOPMENT PROGRAMS,
W70-03838 06B

REGRESSION ANALYSIS
SIMULATION MODEL FOR FLOW AUGMENTATION COSTS,
W70-03940 05G

REGULATION
CORPORATE POWERS (REGULATION OF WATER SUPPLY - FLOOD CONTROL).
W70-03685 04A

HUNTING AND FISHING REGULATIONS.
W70-03777 06F

FISH AND GAME (ENFORCEMENT OF GAME AND FISH LAWS).
W70-03778 06E

CITIES OF THIRD CLASS (POWER TO REGULATE LEVEES).
W70-04038 04A

REMAINS
EVIDENCE FOR EUTROPHICATION FROM REMAINS OF ORGANISMS IN SEDIMENTS,
W70-03977 02H

REMEDIES
CORRECTION OF ERRORS IN ASSESSING DRAINAGE DISTRICT LANDS.
W70-03742 04A

REMOTE SENSING
THE USE OF REMOTE SENSING IN WATER RESOURCE MANAGEMENT,
W70-03985 07B

RESEARCH AND DEVELOPMENT
ON SUBSIDIES TO SPEED THE RATE AT WHICH TECHNOLOGIES ARE DEVELOPED,
W70-03830 06B

RESERVOIR DESIGN
APPLICATIONS OF MONTE CARLO METHOD TO RESERVOIR DESIGN,
W70-03713 02A

EVALUATION OF EXCEEDANCE PROBABILITY OF FLOOD FOR FLOOD-PROTECTION WORKS IN RIVER,
W70-03886 04A

RESERVOIR SYSTEM DESIGN OPTIMIZATION,
W70-03941 04A

RESERVOIR OPERATION
ON THE FLUCTUATION OF WATER RESOURCES,
W70-03705 02A

STOCHASTIC ASPECTS OF RESERVOIR STORAGE,
W70-03706 02A

EVALUATION OF EXCEEDANCE PROBABILITY OF FLOOD FOR FLOOD-PROTECTION WORKS IN RIVER,
W70-03886 04A

RESERVOIR SILTING
SOME PROPOSALS OF THE STOCHASTIC METHOD OF FORECASTING FOR DEPOSITS IN RESERVOIRS,
W70-03709 02J

RESERVOIR YIELD
APPLICATIONS OF MONTE CARLO METHOD TO RESERVOIR DESIGN,
W70-03713 02A

RESERVOIRS
ULTRA-LOW VELOCITY MEASUREMENT IN A STRATIFIED RESERVOIR BY ISOTOPIC CURRENT METER,
W70-03697 02H

RESULTS OF LIMNOLOGICAL INVESTIGATIONS ON THE VALLEY RESERVOIRS IN THE MORAVA RIVER BASIN,
W70-03715 02H

THERMAL DISCHARGE AND WATER QUALITY IN A 1,500-ACRE RESERVOIR,
W70-03845 05C

FACTORS INFLUENCING ALGAL PRODUCTIVITY IN DEER CREEK RESERVOIR, UTAH,
W70-03986 02H

RESOURCE ALLOCATION
SURVEYS OF ECONOMIC THEORY, RESOURCE ALLOCATION, VOLUME III.
W70-03900 06B

RESOURCE DEVELOPMENT
ADMINISTRATIVE ARRANGEMENTS FOR WATER RESOURCES DEVELOPMENT IN MONTANA,
W70-04044 06F

RESOURCE ECONOMICS
IS RESOURCE ECONOMICS UNORTHODOX,
W70-03831 06B

RESPIRATION
SOIL RESPIRATORY ACTIVITY AND ORGANIC MATTER DEPLETION IN AN ARID NEVADA SOIL,
W70-03801 02G

RESTRUCTURING
ADMINISTRATIVE ARRANGEMENTS FOR WATER RESOURCES DEVELOPMENT IN MONTANA,
W70-04044 06E

RETURN TO SCALE
A GENERALIZATION OF THE CES PRODUCTION FUNCTION,
W70-03829 06A

RETURNS TO SCALE
RETURNS TO SCALE AND COST CURVES,
W70-03844 06C

REVERSE OSMOSIS
RESEARCH AND DEVELOPMENT ON LOW PRESSURE REVERSE OSMOSIS MEMBRANES AND DESIGN OF A SMALL UNIT FOR BRACKISH WATER,
W70-03667 03A

TECHNOLOGY OF SEA WATER DESALINATION,
W70-03946 03A

REVIEWS
FRACTURE OF LAKE AND SEA ICE,
W70-03651 02C

DISCRIMINATING THE CHANGE IN MEANS OF HYDROLOGIC VARIABLES,
W70-03888 04A

RHABDITID
DIPLOGASTERID AND RHABDITID NEMATODES IN A WASTEWATER TREATMENT PLANT,
W70-03925 05D

RHODE ISLAND
SUBMERGENCE EFFECTS ON A RHODE ISLAND BARRIER AND LAGOON AND INFERENCES ON MIGRATION OF BARRIERS,
W70-03847 02L

RIGHT-OF-WAY
BRIDGES.
W70-03750 06E

RIO GRANDE
INSTITUTIONAL FACTORS AFFECTING LAND AND WATER DEVELOPMENT, LOWER RIO GRANDE VALLEY, TEXAS,
W70-03865 06B

RIPARIAN RIGHTS
FLORIDA'S LAKES (RIGHTS ATTRIBUTABLE TO NAVIGABLE LAKES),
W70-04017 06E

RISKS
COPING WITH UNCERTAINTY IN THE MAKE OR BUY DECISION,
W70-03826 06B

RIVER BASIN COMMISSIONS
WATERSHED DISTRICTS.
W70-03772 04D

W70-03917 04D

RIVER BASINS
CALCULATION OF MAXIMUM DISCHARGES OF CRIMEAN RIVERS (RUSSIAN),
W70-03682 02E

RUNOFF VOLUME AND MAXIMUM DISCHARGES OF SPRING FLOODS APPLIED TO THE UNSTUDIED RIVERS OF KALININGRADSK REGION (RUSSIAN),
W70-03683 02E

METHODS FOR THE DETERMINATION OF MAXIMUM SNOW RESERVES IN THE RIVER BASINS OF THE CENTRAL CHERNOZEM (BLACK EARTH) BELT (RUSSIAN),
W70-03684 02C

STOCHASTIC STUDY OF CHANNEL DISTRIBUTION IN RIVER BASINS,
W70-03707 02E

STATISTICAL CONSIDERATION IN RIVER MORPHOLOGY,
W70-03708 02E

RIVER FLOW
REDUCTION OF ANNUAL RIVER FLOWS TO LONGER PERIODS (RUSSIAN),
W70-03681 02E

RUNOFF VOLUME AND MAXIMUM DISCHARGES OF SPRING FLOODS APPLIED TO THE UNSTUDIED RIVERS OF KALININGRADSK REGION (RUSSIAN),
W70-03683 02E

RIVER TRENT
TRENT BASIN STOCHASTICS,
W70-03902 02E

RIVERS
PUBLIC PARKS, FORESTS AND RECREATION.
W70-03746 03D

PRODUCTIVITY OF RIVERS,
W70-03979 05C

ROCK EXCAVATION
ROCK CUTTING RESEARCH FOR THE DESIGN AND OPERATION OF TUNNELLING MACHINES,
W70-03793 08E

ROCK SLOPE STABILITY
A MATHEMATICAL MODEL FOR PIT SLOPE STABILITY,
W70-03794 08E

ROCKSLIDES
A MATHEMATICAL MODEL FOR PIT SLOPE STABILITY,
W70-03794 08E

ROUTING
THE DETERMINATION OF LOCAL INFLOWS ENTERING A CHANNEL,
W70-03699 02E

RUNOFF
SUNSPOTS AND HYDROLOGIC TIME SERIES,
W70-03712 02A

RUNOFF COEFFICIENT
SECTION I, INTRODUCTION SECTION II, DETERMINATION OF DESIGN DISCHARGE SECTION IX, APPENDIX.
W70-03815 08A

SALINE WATER
DISTRIBUTION OF CHLORIDES IN AN IRRIGATED CITRUS ORCHARD,
W70-03799 03C

ROOTZONE SALT PROFILES AND ALFALFA GROWTH AS INFLUENCED BY IRRIGATION WATER SALINITY AND LEACHING FRACTION,
W70-03807 02G

REGIONAL VARIATIONS OF RIVER WATER COMPOSITION RESULTING FROM HALITE SOLUTION, MACKENZIE RIVER DRAINAGE BASIN, CANADA,
W70-03860 02K

THERMO-ECONOMICS OF SALINE WATER CONVERSION,
W70-03935 03A

TECHNOLOGY OF SEA WATER DESALINATION,
W70-03946 03A

SALINE WATER INTRUSION
UPCONING OF FRESH WATER-SEA WATER INTERFACE BELOW PUMPING WELLS, FIELD STUDY,
W70-03677 04B

SALINE WATER-FRESHWATER INTERFACES
UPCONING OF FRESH WATER-SEA WATER INTERFACE BELOW PUMPING WELLS, FIELD STUDY,
W70-03677 04B

SALINITY
STATISTICAL EVALUATION OF SALINITY AND NITRATE CONTENT AND TRENDS BENEATH URBAN AND AGRICULTURAL AREA-FRESNO, CALIFORNIA,
W70-03649 05B

DIFFUSION AND ENTRAINMENT IN TWO-LAYER FLOW,
W70-03728 08B

SALTS
'SALT-BISCUITS' - A SPECIAL GROWTH STRUCTURE OF NACL IN SALT SEDIMENTS OF THE TUZ GOLU ('SALT LAKE'), TURKEY,
W70-03671 02K

SAMPLING
A BATTERY POWERED PROPORTIONAL STREAM WATER SAMPLER,
W70-03856 07B

A TEN-UNIT WATER LEVEL SENSING AND RECORDING SYSTEM,
W70-03857 07B

SANDS
EOLIAN MICRORIDGES ON MODERN BEACHES AND A POSSIBLE ANCIENT EXAMPLE,
W70-03661 02L

SANITARY DISTRICTS
SANITARY DRAINAGE DISTRICTS-CITIES OVER 300,000 INHABITANTS AND ADJOINING COUNTIES.
W70-03768 05G

SANITARY ENGINEERING
SEWER DISTRICTS ST. LOUIS COUNTY.
W70-03767 05G

SANITARY DRAINAGE DISTRICTS-CITIES OVER 300,000 INHABITANTS AND ADJOINING COUNTIES.
W70-03768 05G

SATURATED FLOW
MECHANICS OF THE MOVEMENT OF MOISTURE AND CHEMICAL SUBSTANCES IN SOILS,
W70-03881 02G

SAVANNAH RIVER
THE USE OF A TRACER TEST TO VERIFY AN ESTIMATE OF THE GROUNDWATER VELOCITY IN FRACTURED CRYSTALLINE ROCK AT THE SAVANNAH RIVER PLANT NEAR AIKEN, SOUTH CAROLINA,
W70-03899 02F

SCENEDESMUS
A METHOD FOR PREDICTING THE EFFECTS OF LIGHT INTENSITY ON ALGAL GROWTH AND PHOSPHOROUS ASSIMILATION,
W70-03923 05C

SEA WATER
STABILITY OF CALCIUM CARBONATE POLYMORPHS IN WARM, SHALLOW SEAWATER,
W70-03672 02K

SEAWATER
THE RESPONSE OF NATURAL MICROBIAL POPULATIONS IN SEAWATER TO ORGANIC ENRICHMENT,
W70-03967 05C

SECONDARY CLARIFIERS
DIPLOGASTERID AND RHABDITID NEMATODES IN A WASTEWATER TREATMENT PLANT,
W70-03925 05D

SEDIMENT DISCHARGE
DEVELOPMENT OF A RADIOISOTOPE GAGE FOR MONITORING SEDIMENT CONCENTRATION IN RIVERS AND STREAMS,
W70-03687 07B

SEDIMENT DISTRIBUTION
AN ERROR FUNCTION DESCRIPTION OF THE VERTICAL SUSPENDED SEDIMENT DISTRIBUTION,
W70-03873 02J

SEDIMENT TRANSPORT
UNIFICATION OF DATA ON SEDIMENT TRANSPORT IN FLUMES BY SIMILITUDE PRINCIPLES,
W70-03874 02J

SEDIMENT YIELD
SEDIMENT YIELDS FROM THE CENTRAL COLORADO SNOW ZONE,
W70-03821 2J

SEDIMENTARY STRUCTURES
EOLIAN MICRORIDGES ON MODERN BEACHES AND A POSSIBLE ANCIENT EXAMPLE,
W70-03661 02L

SEDIMENTATION
MOBILE-BED FLUVIOLOGY,
W70-03669 02J

SOME PROPOSALS OF THE STOCHASTIC METHOD OF FORECASTING FOR DEPOSITS IN RESERVOIRS,
W70-03709 02J

SUBMERGENCE EFFECTS ON A RHODE ISLAND BARRIER AND LAGOON AND INFERENCES ON MIGRATION OF BARRIERS,
W70-03847 02L

TUBE CLARIFICATION PROCESS, OPERATING EXPERIENCES,
W70-03911 05D

A BREAKTHROUGH IN THE TRACER STUDIES OF SEDIMENTATION TANKS,
W70-03922 05D

SEDIMENTS
GAMMA-RAY SPECTROSCOPY AS A TOOL FOR A RAPID INVESTIGATION OF DETRITIC CORES,
W70-03650 07B

THE INFRA-RED DETERMINATION OF QUARTZ IN SEDIMENTS AND SEDIMENTARY ROCKS,
W70-03678 07B

TUBE CLARIFICATION PROCESS, OPERATING EXPERIENCES,
W70-03911 05D

EVIDENCE FOR EUTROPHICATION FROM REMAINS OF ORGANISMS IN SEDIMENTS,
W70-03977 02H

SEDIMENT-WATER INTERFACES
SEDIMENT-WATER NUTRIENT INTERCHANGE,
W70-03980 02H

SENSITIVITY ANALYSIS
RELATIVE IMPORTANCE OF VARIABLES IN WATER RESOURCES PLANNING,
W70-03656 06B

SEWAGE
REMOVAL OF SEWAGE NUTRIENTS BY ELECTROLYTIC TREATMENT,
W70-03972 05D

PRIVATE SEWERS.
W70-04040 05G

SEWAGE DISPOSAL
PRIVATE SEWER SYSTEMS.
W70-03736 05G

CLASS TWO COUNTIES - SEWER DISTRICTS.
W70-04024 06E

GENERAL SEWER SYSTEM.
W70-04033 05G

PRIVATE SEWERS.
W70-04034 05G

SEWAGE DISTRICTS
SEWER DISTRICTS.
W70-03737 05G

SEWER DISTRICTS ST. LOUIS COUNTY.
W70-03767 05G

LIQUIDATOR FOR SEWER DISTRICTS IN CERTAIN COUNTIES.
W70-03769 05G

SEWER DISTRICTS (CONSTRUCTION OF SEWERS IN UNINCORPORATED JURISDICTIONS),
W70-04023 06E

CLASS TWO COUNTIES - SEWER DISTRICTS.
W70-04024 06E

SEWERAGE - WATER WORKS.
W70-04025 05G

PRIVATE SEWERS.
W70-04040 05G

SEWAGE EFFLUENTS
REMOVAL OF SEWAGE NUTRIENTS BY ELECTROLYTIC TREATMENT,
W70-03972 05D

SEWAGE SLUDGE
DIALYSIS SEPARATION OF SEWAGE SLUDGE DIGESTION,
W70-03929 05D

SEWAGE TREATMENT
PHYSICOCHEMICAL TREATMENT OF WASTEWATER,
W70-03927 05D

USE OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES CHAPTER III,
W70-03933 05B

SIMULATION MODEL FOR FLOW AUGMENTATION COSTS,
W70-03940 05G

REMOVAL OF SEWAGE NUTRIENTS BY ELECTROLYTIC TREATMENT,
W70-03972 05D

CLASS TWO COUNTIES - SEWER DISTRICTS.
W70-04024 06E

SEWER DISTRICTS
CLASS TWO COUNTIES - SEWER DISTRICTS.
W70-04024 06E

SEWERAGE - WATER WORKS.
W70-04025 05G

SEWERS
SEWER DISTRICTS.
W70-03737 05G

SEWERS AND WATERWORKS.
W70-03748 05G

SANITARY DRAINAGE DISTRICTS-CITIES OVER 300,000 INHABITANTS AND ADJOINING COUNTIES.
W70-03768 05G

SEWER DISTRICTS (CONSTRUCTION OF SEWERS IN UNINCORPORATED JURISDICTIONS).
W70-04023 06E

PRIVATE SEWERS.
W70-04040 05G

SHALLOW WATER
STABILITY OF CALCIUM CARBONATE POLYMORPHS IN WARM, SHALLOW SEAWATER,
W70-03672 02K

SHALLOW-DEPTH-SEDIMENTATION
TUBE CLARIFICATION PROCESS, OPERATING EXPERIENCES,
W70-03911 05D

SIMULATED RAINFALL
A MODEL FOR GENERATING SYNTHETIC SEQUENCES OF SHORT-TIME-INTERVAL RAINFALL DEPTHS,
W70-03703 02B

SIMULATION ANALYSIS
SIMULATION MODEL FOR FLOW AUGMENTATION COSTS,
W70-03940 05G

SKULL VALLEY(UTAH)
HYDROLOGIC RECONNAISSANCE OF SKULL VALLEY, TOOELE COUNTY, UTAH,
W70-03811 02F

SLICKS
SURFACE SLICKS AS CONCENTRATORS OF PESTICIDES IN THE MARINE ENVIRONMENT,
W70-03953 05A

SLOPE STABILITY
A MATHEMATICAL MODEL FOR PIT SLOPE STABILITY,
W70-03794 08F

SLUDGE
REMOVAL OF SEWAGE NUTRIENTS BY ELECTROLYTIC TREATMENT,
W70-03972 05D

SLUDGE DENSITY INDEX
GRAVITY THICKENERS FOR ACTIVATED SLUDGE,
W70-03914 05D

SLUDGE DISPOSAL
BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES VOLUME I - THE WASTE MANAGEMENT CONCEPT.
W70-04005 05E

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES VOLUME II - CRITERIA FOR WASTE MANAGEMENT,
W70-04006 05E

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES VOLUME III - TECHNICAL ASPECTS OF PIPELINING OF WASTE MATERIALS,
W70-04007 05E

SLUDGE VOLUME INDEX
GRAVITY THICKENERS FOR ACTIVATED SLUDGE,
W70-03914 05D

SLUDGE-VOLUME RATIO
GRAVITY THICKENERS FOR ACTIVATED SLUDGE,
W70-03914 05D

SLURRIES
BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES SUMMARY REPORT,
W70-04004 05E

BULK TRANSPORT OF WASTE SLURRIES TO INLAND AND OCEAN DISPOSAL SITES VOLUME III - TECHNICAL ASPECTS OF PIPELINING OF WASTE MATERIALS,
W70-04007 05E

SMALL WATERSHEDS
EFFECTS OF FLOOD PROTECTION ON LAND USE IN THE COON CREEK, WISCONSIN, WATERSHED,
W70-03654 04A

A WORKING MODEL FOR THE VARIATION IN STREAM WATER CHEMISTRY AT THE HUBBARD BROOK EXPERIMENTAL FOREST, NEW HAMPSHIRE,
W70-03867 02K

PURPOSE AND PERFORMANCE OF PEAK PREDICTIONS,
W70-03887 04A

SNOW
SNOW ALBEDO MODIFICATION - A REVIEW OF LITERATURE,
W70-03652 02C

METHODS FOR THE DETERMINATION OF MAXIMUM SNOW RESERVES IN THE RIVER BASINS OF THE CENTRAL CHERNOZEM (BLACK EARTH) BELT (RUSSIAN),
W70-03684 02C

SNOW COVER
METHODS FOR THE DETERMINATION OF MAXIMUM SNOW RESERVES IN THE RIVER BASINS OF THE CENTRAL CHERNOZEM (BLACK EARTH) BELT (RUSSIAN),
W70-03684 02C

SNOWMELT
METHODS FOR THE DETERMINATION OF MAXIMUM SNOW RESERVES IN THE RIVER BASINS OF THE CENTRAL CHERNOZEM (BLACK EARTH) BELT (RUSSIAN),
W70-03684 02C

SOCIAL ASPECTS
BIBLIOGRAPHY ON SOCIO-ECONOMIC ASPECTS OF WATER RESOURCES,
W70-03714 06B

BENEFIT-COST ANALYSIS A CRITERION FOR SOCIAL INVESTMENT,
W70-03999 06B

SOCIAL COSTS
THE WATER SUPPLY SYSTEM UP TO A.D. 2001,
W70-03842 06C

ECONOMIC ANALYSIS IN WATER QUALITY MANAGEMENT,

SOCIAL GOALS
WATER FOR WESTERN FEDERAL IRRIGATION PROJECTS,
W70-03996 03F

SOCIAL INVESTMENT
BENEFIT-COST ANALYSIS A CRITERION FOR SOCIAL INVESTMENT,
W70-03999 06B

SOCIOECONOMIC STATUS
SOCIOECONOMIC STATUS A RE-EXAMINATION OF ITS DIMENSIONS,
W70-03837 06B

SODIUM CHLORIDE
'SALT-BISCUITS' - A SPECIAL GROWTH STRUCTURE OF NACL IN SALT SEDIMENTS OF THE TUZ GOLU ('SALT LAKE'), TURKEY,
W70-03671 02K

SOIL COLUMNS
INFILTRATION, REDISTRIBUTION, AND SUBSEQUENT EVAPORATION OF WATER FROM SOIL AS AFFECTED BY WETTING RATE AND HYSTERESIS,
W70-03852 02G

SOIL CONSERVATION
SOIL AND WATER CONSERVATION DISTRICTS.
W70-03918 04D

MISSOURI SOIL AND WATER CONSERVATION DISTRICTS LAW.
W70-04041 03D

SOIL MICROORGANISMS
SOIL RESPIRATORY ACTIVITY AND ORGANIC MATTER DEPLETION IN AN ARID NEVADA SOIL,
W70-03801 02G

SOIL MOISTURE
DOWNWARD MOVEMENT OF SOIL MOISTURE TRACED BY MEANS OF HYDROGEN ISOTOPES,
W70-03689 02G

THE EFFECT OF SOIL MOISTURE ON INFILTRATION AS RELATED TO RUNOFF AND RECHARGE,
W70-03884 02G

RELATIONSHIPS BETWEEN SOIL MOISTURE ACTUAL AND POTENTIAL EVAPOTRANSPIRATION,
W70-03885 02D

SOIL MOISTURE METERS
DESIGN OF A NEUTRON SCATTERING WATER CONTENT GAGE FOR SOILS,
W70-03686 07B

MINIMIZING NUCLEAR SOIL DENSITY AND MOISTURE CONTENT GAGE ERRORS,
W70-03787 07B

SOIL RUNOFF
CONSERVING RESOURCES AND MAINTAINING A QUALITY ENVIRONMENT,
W70-03823 05B

SOIL SEALANTS
RUNOFF INDUCEMENT IN ARID LANDS,
W70-03809 03B

SOIL STABILITY
PRE-EQUILIBRIUM OBSERVATIONS ON THE RECONSTRUCTED FLAGSTAFF GULLY DAM,
W70-03782 08D

SOIL TREATMENT
SOIL RESPIRATORY ACTIVITY AND ORGANIC MATTER DEPLETION IN AN ARID NEVADA SOIL,
W70-03801 02G

LABORATORY TESTS OF SPRAYABLE MATERIALS FOR RUNOFF INDUCEMENT ON A LOESSIAL SOIL,
W70-03804 02E

SOIL WATER MOVEMENT
FIELD MEASUREMENT AND USE OF SOIL-WATER PROPERTIES,
W70-03675 02G

DOWNWARD MOVEMENT OF SOIL MOISTURE TRACED BY MEANS OF HYDROGEN ISOTOPES,
W70-03689 02G

SOIL FACTORS INFLUENCING PERCOLATION TEST PERFORMANCE,
W70-03850 02G

NUMERICAL METHOD FOR ESTIMATING SIMULATANEOUS FLOW OF WATER AND SALT IN UNSATURATED SOILS,
W70-03851 02G

INFILTRATION, REDISTRIBUTION, AND SUBSEQUENT EVAPORATION OF WATER FROM SOIL AS AFFECTED BY WETTING RATE AND HYSTERESIS,
W70-03852 02G

COMPARISON OF COMPUTED AND MEASURED MOISTURE REDISTRIBUTION FOLLOWING INFILTRATION,
W70-03853 02G

CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO AREAL INVESTIGATIONS AND MISCELLANEOUS ACTIVITIES,
W70-03663 02F

CHENOUARD, LYDIE
GAMMA-RAY SPECTROSCOPY AS A TOOL FOR A RAPID INVESTIGATION OF DETRITIC CORES,
W70-03650 07B

CHESTER, R.
THE INFRA-RED DETERMINATION OF QUARTZ IN SEDIMENTS AND SEDIMENTARY ROCKS,
W70-03678 07B

CLINE, J. N.
EVAPORATIVE COOLING OF HEATED IRRIGATION WATER BY SPRINKLER APPLICATION,
W70-03718 05D

CLYDE, EDWARD W.
MINERAL RIGHTS VERSUS WATER RIGHTS,
W70-03735 06E

COCKELL, G. J.
A MOSAIC TECHNIQUE FOR GENERATING THE DAILY PATTERN WITHIN A SYNTHETIC FLOW SEQUENCE,
W70-03704 02A

COFFEY, C. T.
APPLICATION OF PORE PRESSURE MEASUREMENTS TO SHEAR STRENGTH OF COHESIVE SOILS,
W70-03788 07B

COLEMAN, NEIL L.
VERIFICATION OF DATA ON SEDIMENT TRANSPORT IN PLUMES BY SIMILITUDE PRINCIPLES,
W70-03874 02J

COLP, J. A.
A MOSAIC TECHNIQUE FOR GENERATING THE DAILY PATTERN WITHIN A SYNTHETIC FLOW SEQUENCE,
W70-03704 02A

CONLEY, WALTER R.
TUBE CLARIFICATION PROCESS, OPERATING EXPERIENCES,
W70-03911 05D

COOK, W. I.
ECOLOGY OF YEASTS FROM LAKE CHAMPLAIN,
W70-03962 05A

COOPER, LEON
AN EXTENSION OF THE GENERALIZED WEBER PROBLEM,
W70-03840 06A

CORCORAN, E. F.
SURFACE SLICKS AS CONCENTRATORS OF PESTICIDES IN THE MARINE ENVIRONMENT,
W70-03953 05A

COREY, A. T.
SIMILITUDE FOR PARTIALLY SATURATED FLOW SYSTEMS,
W70-03883 02G

COREY, G. L.
SIMILITUDE FOR PARTIALLY SATURATED FLOW SYSTEMS,
W70-03883 02G

CORMACK, J. F.
FERMENTATION OF SPENT SULFITE LIQUOR FOR THE PRODUCTION OF VOLATILE ACIDS,
W70-03921 05D

CRAINE, LYLE E.
COMMENT ON, 'MESHING WATERSHED DEVELOPMENT WITH RIVER BASIN DEVELOPMENT',
W70-03989 06B

CRUTCHFIELD, JAMES A.
ECONOMIC ANALYSIS IN WATER QUALITY MANAGEMENT,
W70-04000 06B

CULP, GORDON L.
TUBE CLARIFICATION PROCESS, OPERATING EXPERIENCES,
W70-03911 05D

CURTIS, W. F.
CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO AREAL INVESTIGATIONS AND MISCELLANEOUS ACTIVITIES,
W70-03663 02E

CUSENS, A. R.
DISTRIBUTION OF CONCENTRATED LOADS ON ORTHOTROPIC BRIDGE DECKS,
W70-03798 08A

CZEPA, OTTO
ADAPTIVE FILTERS FOR TREND EXTRAPOLATION OF RUNOFF RECORDS,
W70-03710 07C

DAGON, RONALD
LARGE VOLUME - LONG DISTANCE FRESH WATER TRANSFERRAL AS AN ALTERNATE TO DESALINATION,
W70-03810 06D

DAVIDSON, J. M.
FIELD MEASUREMENT AND USE OF SOIL-WATER PROPERTIES,
W70-03675 02G

DAVIS, ERNST M.
ANIONIC AND NONIONIC SURFACTANT SORPTION AND DEGRADATION BY ALGAE CULTURES,
W70-03928 05D

DAY, JOHN C.
AN ACTIVITY ANALYSIS OF NON-STRUCTURAL PLAIN MANAGEMENT ALTERNATIVES CHAPTER IV,
W70-04003 06F

DEININGER, ROLF A.
ESTIMATION OF THE PARAMETERS OF GUMBEL'S THIRD ASYMPTOTIC DISTRIBUTION BY DIFFERENT METHODS,
W70-03674 07C

DERR, E. D.
SOIL FACTORS INFLUENCING PERCOLATION TEST PERFORMANCE,
W70-03850 02G

DICKENS, W. L.
FUNCTIONS FOR COTTON (GOSSYPIUM HIRSUTUM L.) PRODUCTION FROM IRRIGATION AND NITROGEN FERTILIZATION VARIABLES II. YIELD COMPONENTS AND QUALITY CHARACTERISTICS,
W70-03805 02I

FUNCTIONS FOR COTTON (GOSSYPIUM HIRSUTUM L.) PRODUCTION FROM IRRIGATION AND NITROGEN FERTILIZATION VARIABLES I. YIELD AND EVAPOTRANSPIRATION,
W70-03806 02I

DICKINSON, W. T.
AN ERROR MODEL FOR A SINGLE DISCHARGE MEASUREMENT,
W70-03700 02E

ERRORS IN DISCHARGE ESTIMATES ON MOUNTAIN STREAMS,
W70-03889 02A

DILLON, WILLIAM P.
SUBMERGENCE EFFECTS ON A RHODE ISLAND BARRIER AND LAGOON AND INFERENCES ON MIGRATION OF BARRIERS,
W70-03847 02L

DIRKSEN, C.
THERMO-OSMOSIS THROUGH COMPACTED SATURATED CLAY MEMBRANES,
W70-03859 02G

DOLE, HOLLIS M.
OCEAN MINERALS AND THE LAW,
W70-03822 06E

DONALDSON, JOHN R.
THE CLASSIFICATION OF LAKES,
W70-03984 02H

DONEY, LLOYD D.
COPING WITH UNCERTAINTY IN THE MAKE OR BUY DECISION,
W70-03826 06B

DORCHESTER, J. E. C.
THE EFFECT OF DIETARY FAT ON THE HEAT TOLERANCE OF GOLDFISH (CARASSIUS AURATUS),
W70-03723 05C

DOREMAN, ROBERT
OPERATIONS RESEARCH,
W70-03992 06A

DORRIS, TROY C.
CARBON SOURCES IN ALGAL POPULATIONS AND ALGAL COMMUNITY STRUCTURE,
W70-04001 05B

DOWNER, RICHARD N.
APPLICATION OF RUNS TO HYDROLOGIC DROUGHTS,
W70-03909 02E

DOYEL, W. W.
CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO GROUNDWATER STATIONS,
W70-03658 02F

CATALOG OF INFORMATION ON WATER DATA, EDITION 1968 - INDEX TO AREAL INVESTIGATIONS AND MISCELLANEOUS ACTIVITIES,
W70-03663 02E

DREIER, A. F.
YIELD-PROTEIN RELATIONSHIPS IN WHEAT GRAIN, AS AFFECTED BY NITROGEN AND WATER,
W70-03800 02G

DUCKSTEIN, LUCIEN
POINT RAINFALL FREQUENCIES IN CONVECTIVE STORMS,
W70-03673 02B

DUGDALE, RICHARD C.
NITROGEN METABOLISM IN LAKES. I. MEASUREMENT OF NITROGEN FIXATION WITH N-15,
W70-03970 02H

DUGDALE, VERA A.
NITROGEN METABOLISM IN LAKES. I. MEASUREMENT OF NITROGEN FIXATION WITH N-15,
W70-03970 02H

DUKLER, A. E.
DEVELOPMENT OF MATHEMATICAL MODEL AND COMPUTER PROGRAM FOR OPTIMIZATION OF VERTICAL TUBE EVAPORATOR SALINE WATER PLANTS,
W70-03665 03A

DURYEA, R. D.
BIBLIOGRAPHY OF THE GROUNDWATER RESOURCES OF NEW YORK THROUGH 1967,
W70-03659 02F

DYCK, SIEGFRIED
APPLICATIONS OF MONTE CARLO METHOD TO RESERVOIR DESIGN,
W70-03713 02A

EAGLESON, P. S.
A MODEL FOR GENERATING SYNTHETIC SEQUENCES OF SHORT-TIME-INTERVAL RAINFALL DEPTHS,
W70-03703 02B

EDMUNDSON, ELDON, JR.
MARINE RADIOECOLOGY,
W70-03956 05C

EISELSTEIN, LEO M.
A PRINCIPAL COMPONENT ANALYSIS OF SURFACE RUNOFF DATA FROM A NEW ZEALAND ALPINE WATERSHED,
W70-03908 02E

ELDER, REX A.
ULTRA-LOW VELOCITY MEASUREMENT IN A STRATIFIED RESERVOIR BY ISOTOPIC CURRENT METER,
W70-03697 02H

ELRICK, D. E.
MECHANICS OF THE MOVEMENT OF MOISTURE AND CHEMICAL SUBSTANCES IN SOILS,
W70-03881 02G

ENCARNACION, JOSE
ON INDEPENDENCE POSTULATES CONCERNING CHOICE,
W70-03832 06B

ERIKSSON, ERIK
THE ATMOSPHERIC TRANSPORT OF TRITIUM,
W70-03692 02B

LARGE-SCALE UTILIZATION OF TRITIUM IN HYDROLOGIC STUDIES,
W70-03894 02A

EVANS, ROBERT B.
THERMO-ECONOMICS OF SALINE WATER CONVERSION,
W70-03935 03A

EVANS, ROBERT H.
OPERATION OF SEA WATER DISTILLATION PLANTS,
W70-03657 03A

FERBER, ROBERT
RESEARCH ON HOUSEHOLD BEHAVIOR,
W70-03994 06B

FILBY, ROYSTON H.
TRACE ELEMENT MEASUREMENTS IN THE AQUATIC ENVIRONMENT,
W70-03981 02H

FISHER, D. W.
A WORKING MODEL FOR THE VARIATION IN STREAM WATER CHEMISTRY AT THE HUBBARD BROOK EXPERIMENTAL FOREST, NEW HAMPSHIRE,
W70-03867 02K

FLETCHER, LEHMAN B.
A GENERALIZATION OF THE CES PRODUCTION FUNCTION,
W70-03829 06A

FOGEL, MARTIN M.
POINT RAINFALL FREQUENCIES IN CONVECTIVE STORMS,
W70-03673 02B

FOSS, B.
A COST MODEL FOR COASTAL SHIPPING, A NORWEGIAN EXAMPLE,
W70-03834 06B

FOSTER, WILLIAM S.
THE WATER-RESOURCE COMMUNICATIONS GAP,
W70-03841 06D

FOYN, ERNST
REMOVAL OF SEWAGE NUTRIENTS BY ELECTROLYTIC TREATMENT,
W70-03972 05D

FREDRIKSEN, R. L.
A BATTERY POWERED PROPORTIONAL STREAM WATER SAMPLER,
W70-03856 07B

FREY, DAVID G.
EVIDENCE FOR EUTROPHICATION FROM REMAINS OF ORGANISMS IN SEDIMENTS,
W70-03977 02H

FRIEDMAN, IRVING
APPLICATION OF DEUTERIUM ANALYSES TO THE HYDROLOGY OF THE LAKES OF THE GRAND COULEE, WASHINGTON,
W70-03696 02K

FRY, F. E. J.
THE RELATION OF TEMPERATURE TO OXYGEN CONSUMPTION IN THE GOLDFISH,
W70-03722 05C

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 3, NUMBER 11
JUNE 1, 1970

THE LIBRARY OF THE
JUN 19 1970
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W70-04045 -- W70-04543

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 11
JUNE 1, 1970

W70-04045 -- W70-04543

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

AN EXPERIMENTAL STUDY OF THE STRUCTURE, THERMODYNAMICS AND KINETIC BEHAVIOR OF WATER,
Midwest Research Inst., Kansas City, Mo.
Frank T. Greene, Thomas A. Milne, A. E. Vandergrift, and Jacob Beachey.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $0.65. Office Saline Water Research and Development Progress Report No 493, Oct 1969. 60 p, 19 fig, 11 tab, 40 ref. OSW Contract No 14-01-0001-1479.

Descriptors: *Water properties, *Thermodynamic behavior, Analytical techniques, Spectrometers, Free energy, Temperature, Research and development.
Identifiers: *Water cluster formation.

Mass spectrometry and molecular beam sampling techniques were used to obtain information on the thermodynamics and rates of water cluster formations. High and low pressure measurements of cluster formation give apparent concentrations (and free energy of formation) for dimers and trimers as well as an upper limit for the concentration of tetramers. The mole fractions of trimers and tetramers in steam at 1 atmosphere and 373 deg K were calculated. The dimerization rate constant is strongly temperature-dependent and is much less at 300 deg K than three-body collisional frequency factors would indicate. Reverse reactions are quite important in dimer growth. Dimer is formed in appreciable quantities near the end of expansion, in the ill-defined transition region to collisionless flow. More research in this area is recommended. (Carstea-USGS)
W70-04085

PHYSICAL PROPERTIES OF SEA WATER SOLUTIONS: HEAT CAPACITY,
National Engineering Lab., East Kilbride (Scotland).
D. T. Jamieson, J. S. Tudhope, R. Morris, and G. Cartwright.
Desalination, Vol 7, No 1, p 23-30, Nov 1969. 8 p, 4 fig, 3 tab, 7 ref.

Descriptors: *Water properties, *Sea water, *Thermal properties, Thermodynamic behavior, Thermodynamics, Scaling, Desalination, Distillation, Aqueous solutions, Saline water.
Identifiers: Heat capacity (Sea water).

The heat capacity of sea water and its concentrates has been measured in the temperature range 80 deg to 180 deg C using a differential heating method. An equation is given which fits the measured values of heat capacity, together with those from the literature, to within their various experimental accuracies. (Knapp-USGS)

1B. Aqueous Solutions and Suspensions

A NEUTRON SCATTERING STUDY OF WATER AND IONIC SOLUTIONS,
Union Carbide Corp., Tuxedo, N.Y.
G. J. Safford, and P. S. Leung.
Available from Superintendent of Documents, U. S. Government Printing Office, Wash, D C - Price 55 cents per copy. Office of Saline Water Research and Development Progress Report No 485, September 1969. 36 p, 13 fig, 43 ref.

Descriptors: *Neutron absorption, *Aqueous solutions, Frequency analysis, Diffusion, Magnesium compounds, Sodium chloride, Cesium, Ions, Hydration, Kinetics, Analytical techniques.
Identifiers: *Neutron inelastic scattering, Intermolecular frequencies, Ion hydration.

Neutron inelastic scattering was used to study the dependences on concentration, cations, and anions of the intermolecular frequencies and the diffusive kinetics of water molecules in aqueous solutions. The intermolecular frequencies at lower concentrations of magnesium chloride, NaCl and CsCl were nearly identical with those of water. With increasing concentration, new frequencies characteristic of primary hydration complexes appeared and intensified. The frequencies and diffusive parameters of solutions containing small or highly charged cations were primarily determined by the cations and only secondarily affected by monovalent anions. In contrast, a strong dependence on anions in solutions of larger, single-charged cations was observed at intermolecular frequencies and in diffusive kinetics. (Carstea-USGS)

02. WATER CYCLE

2A. General

RUNOFF FROM FOREST AND AGRICULTURAL WATERSHEDS,
Colorado State Univ., Fort Collins. Natural Resources Center.
M. E. Holland.
Available from the Clearinghouse as PB-189 764, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 19 p, 4 tab, 3 fig, 3 ref. OWRR Project A-002-COLO.

Descriptors: *Surface runoff, *Runoff, *Unit hydrograph, *Rainfall-runoff relationships, Forest watersheds, Agricultural watershed.

The dichotomy between forest and agricultural watersheds with areas less than 40 square miles has been studied by looking at the time distribution of runoff from storm rainfall events. The direct investigation of rise times for hydrographs gave inconclusive results, but led to a more fruitful second approach. The second part of the investigation focused on the unit hydrograph as the characteristic response of the watershed. The unit hydrograph can be represented mathematically by two-parameter incomplete gamma function. The rise time for the unit hydrograph is a convenient and significant parameter in determining the shape of the unit hydrograph. The effects of the physiographic parameters of watersheds were removed by determining a hypothetical median watershed and varying the cover characteristics from forest to agricultural. The influences of steeper slopes that are common in forest watersheds were thus eliminated. The results clearly indicate the significant damping that forest cover causes in the watershed response to rainfall.

STOCHASTIC ANALYSIS OF HYDROLOGIC SYSTEMS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Ven Te Chow.
Available from the Clearinghouse as PB-189 791, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Illinois Water Resources Center, Research Report No 26, Dec 1969. 34 p, 8 fig, 14 ref. OWRR Project A-029-ILL.

Descriptors: Systems analysis, Stochastic processes, Synthetic hydrology, Water resources develop, Streamflow, Evapotranspiration, Storage, Water yield, Hydrology.
Identifiers: Watershed studies, Precipitation, Hydrologic models.

Hydrologic phenomena are in reality stochastic in nature; that is, their behavior changes with the time in accordance with the law of probability as well as with the sequential relationship between the occurrences of the phenomenon. In order to analyze the hydrologic phenomenon, a mathematic model of the stochastic hydrologic system to simulate the phenomenon must be formulated. In this study, a watershed is treated as the stochastic hydrologic system whose components of precipitation, runoff, storage, and evapotranspiration are simulated as stochastic processes by time series models to be determined by correlograms and spectral analysis. The hydrologic system model is then formulated on the basis of the principle of conservation of mass and composed of the component stochastic processes. To demonstrate the practical application of the method of analysis so developed, the upper Sangamon River basin above Monticello in east central Illinois is used as the sample watershed. The watershed system model so formulated can be employed to generate stochastic streamflows for practical use in the analysis of water resources systems. This is of particular value in the economic planning of water supply and irrigation projects which is concerned with the long-range water yield of the watershed.

STUDY OF THE INTERRELATIONSHIP BETWEEN SURFACE AND UNDERGROUND WATERS IN THE AY RIVER BASIN (RUSSIAN),
Institut po Proektirovaniiu Predpriiatii Nikelevoi Promyshlennosti, Leningrad (USSR).
P. V. Molitvin.
In: Trudy Soveshchaniya po Voprosam Kompleksnogo Izucheniya Rezhima Poverkhnostnykh i Podzemnykh Vod v Karstovynkh Rayonakh (Proc of Conf on Complex Problems of Surface and Groundwater Systems in Karstic Regions), Upravleniye Gidrometeorologicheskoy Sluzhby, Ukr, SSR, p 114-121, 1969. 8 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Surface-groundwater relationships, *Groundwater, *Groundwater movement, *River basins, *Karst, Mountains, Geology, Sinks, Runoff, Discharge (Water), Snowmelt, Rivers, Water loss, Mathematical studies, Mining engineering, Floods, Tracers, Dye releases.
Identifiers: *USSR, Ay River basin.

Hydrological and karstic characteristics of the central watershed of the Ay River and the intercommunication between the surface waters and underground waters were investigated by fluorescent techniques. In carrying out mining operations in the basin, the main water seepage is due to the surface waters of the Kamenka River basin. Atmospheric precipitation over the karstic area will also contribute to the possible flooding of tunnels and shafts. (Gabriel-USGS)

SOME CONSIDERATIONS IN THE ADAPTION OF MARKOV PROCESS THEORY TO RAINFALL-RUNOFF PHENOMENON,
Utah Water Research Lab., Logan.
Jay M. Bagley.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 79, p 633-640, 1967. 8 p, 1 fig, 2 tab, 1 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Synthetic hydrology, *Markov processes, Time series analysis, Model studies, Mathematical models, Stochastic processes, Probability.
Identifiers: Watershed models.

The rainfall-runoff process may be characterized by a Markovian stochastic model. The system description utilizes finite time increments of one day for the volumes of precipitation, evapotranspiration, infiltration, soil moisture storage changes, and runoff. The validity of a stationarity assumption (time-independence) for soil moisture storage on a monthly basis was examined and found to be of questionable utility for obtaining runoff probabilities. Equivalent monthly probability distributions were developed which gave considerable improvement and offer promise in providing working tools for purposes of engineering design. The effect

of size of the finite water increment employed in the model is evaluated. Larger increments of water make approximations to the frequency distributions of daily rainfall much more crude. They also give poor approximations to the functions describing processes in the system that change more slowly with time. The study suggests modifications revealed and make the approach more useful. (Knapp-USGS)

A STATISTICAL METHOD TO SEARCH FOR A RAINFALL-RUNOFF RELATIONSHIP,
Universidad Nacional Autonoma de Mexico, Mexico City. Instituto de Ingenieria.
A. Capella Vizcaino, and J. L. Sanchez Bribiesca.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 77, p 616-623, 1967. 8 p, 5 fig, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Systems analysis, Model studies, Synthetic hydrology, Input-output analysis, Simulation analysis, Mathematical models, Floods.
Identifiers: Hydrologic systems analysis.

Classical methods too often fail to relate rainfall and runoff in basins, when applied to specific cases. The random characteristics of the phenomenon seem to be the main cause. A 'black box' approach, based on Automatic Control techniques is introduced in this paper, as a synthesis system obtained from observed inputs (rainfall) and outputs (runoff). The model can take into consideration rainfall distribution in a basin area, once a weighing function has been established for each input, from a set of orthogonal functions. Changes in the weighing functions are considered, although the great number of parameters involved, and the scarcity of data, introduce limitations to the selected model; besides, it is difficult to attach a reasonable physical interpretation to the results. (Knapp-USGS)

TRANSFORMATION OF DETERMINISTIC AND STOCHASTIC PROCESSES IN HYDROLOGY,
Arizona Univ., Tucson.
Chester C. Kisiel.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 75, p 600-607, 1967. 8 p, 23 ref.

Descriptors: *Stochastic processes, *Parametric hydrology, Linear programming, Input-output analysis, Model studies, Statistical models, Synthetic hydrology, Forecasting, Streamflow forecasting, Statistical methods, Time series analysis.
Identifiers: *Stochastic hydrology.

The theory of random functions forms the mathematical foundation of parametric and stochastic hydrology and shows their inherent unity. The stochastic approach is the more general. The theory of random functions is employed to predict the output statistics of a variety of transformation processes of interest in hydrology: rainfall to runoff or reservoir inflow to reservoir outflow. In general, such prediction is possible only for linear systems with or without memory. It is recognized that hydrologic transformations are nonlinear; yet, it is suggested that linear systems theory provides a first-order approximation to changes in output statistics for planned or unplanned modifications of the hydrologic environment. The changes in input-output statistics may be used as a measure of linearity of basin response. These nonstationarities as introduced by human manipulation of watershed response are important to the prediction problem, and thus to the economic design of hydraulic structures subjected to hydrologic events whose average return periods change as a result of man's intervention. APPLICATION OF A COMPUTER MODEL TO A DESERT WATERSHED,
Arizona Univ., Tucson. Dept. of Watershed Management.
J. H. Kitchen, and J. L. Thames.
Progressive Agriculture in Arizona, Vol 21, No 6, p 12-13, November-December 1969. 1 fig.

Descriptors: *Arizona, *Watershed management, *Computer models, *Runoff, *Small watersheds, Hydrologic cycle, Model studies, Hydrographs, Deserts.
Identifiers: *Purdue University Watershed Model, Tucson Basin, Arizona.

Approximately five percent of the total precipitation which falls on Arizona deserts is retained for man's use. More efficient watershed management would be possible if runoff could be accurately predicted. The most promising new method is watershed modeling using computers. Although the Purdue University model was designed for use on cultivated land in Indiana, it was chosen for study of a small desert watershed in the Tucson Basin of Arizona. The model was applied without modification and the result was a close agreement in general shape and size between the predicted and actual hydrograph. The differences that did occur may be the result of the uneven rainfall, as the model assumes uniform rainfall distribution. The study indicates that practical working watershed models can be developed. (Carr-Arizona)

HYDROGEOLOGY OF THE RIO GRANDE VALLEY AND ADJACENT INTERMONTANE AREAS OF SOUTHERN NEW MEXICO,
New Mexico State Univ., University Park. Water Resources Research Inst.
W. E. King, J. W. Hawley, A. M. Taylor, and R. P. Wilson.
New Mexico State University, Las Cruces, Water Resources Research Institute, Report No 6, June 1969. 141 p, 6 fig, 4 tab, 79 ref, map.

Descriptors: *Hydrogeology, *Aquifers, *New Mexico, *Groundwater, *Geomorphology, Geology, Rio Grande, Groundwater barriers, Groundwater basins, Semiarid climates, Soils, Geologic formations, Stratigraphy, Wells, Water chemistry
Identifiers: *Rio Grande Valley

The region under investigation is a 3600 square-mile area of southern New Mexico lying along the Rio Grande Valley. The local mountains are mainly of the block-faulted type. Consolidated rocks are a primary barrier to the movement of groundwater and these rocks serve as an important source of the dissolved solids found in local water supplies. There are four major hydrogeologic units of these rocks: Precambrian and Tertiary igneous intrusive and metamorphic rocks; Paleozoic, late Mesozoic, and early Tertiary carbonate and other clastic sedimentary rocks; Tertiary volcanic and associated sedimentary rocks; and late Cenozoic basalts. The two major groundwater reservoirs in the region are the late Quaternary Rio Grande Valley fill (80 feet thick) and the Miocene to mid-Pleistocene Santa Fe Group basin fill (3500 feet thick). The Valley fill is capable of high-yield aquifers and is an important water resource for New Mexico. The upland basin fill has less permeable aquifer beds and therefore its wells do not produce as much water. (Carr-Arizona)

EFFECTS OF WEATHER MODIFICATION ON PLANT AND ANIMAL COMMUNITIES,
Michigan Univ., Ann Arbor. School of Natural Resources.
Charles F. Cooper.
American Association for the Advancement of Science, Committee on Arid Lands, Symposium on Weather Modification, New York, December 30, 1967. Miss 11 p, 9 ref.

Descriptors: *Weather modification, *Artificial precipitation, Cloud seeding, *Biological communities, Ecology, *Ecosystems, *Arid lands, Semiarid climates, Social aspects, Rainfall.
Identifiers: *Ecological effects.

A TEMPORARY CHANGE IN PRECIPITATION MAY ALTER RATES AND PATHWAYS THROUGH WHICH ENERGY IS CHANNELLED, BUT THE STRUCTURE OF THE SYSTEM IS ONLY SLIGHTLY MODIFIED. However, with a long term increase in rainfall, altered patterns of reproduction and growth may cause the emergence of an entirely new community structure. Given certain assumptions as to the nature of the weather changes, one may hypothesize the following ecological effects in arid regions: (1) species will respond as individuals, not as communities; (2) biological changes from a given percentage increase in rainfall will be greatest in semiarid climates and somewhat less in arid regions, (3) areas of uniform precipitation will be the most susceptible to the planned weather changes; (4) communities with stable populations will be the most sensitive to climatic change; (5) disappearance of a species from an area will be more the result of competition from favored species already present than of competition from invaders; and (6) moderately grazed livestock range is likely to change more in species composition than either heavily grazed or ungrazed areas. These hypotheses, based almost entirely on inference, await testing and refining with empirical data. Ecology is at the threshold of useful predictions which could be employed in the political decision framework. (Carr-Arizona)

2C. Snow, Ice, and Frost

SNOW ACCUMULATION IN RELATION TO FOREST CANOPY,
Colorado State Univ., Fort Collins. Natural Resources Center.
J. Meiman, H. Frochlick, and R. E. Dils.
Available from the Clearinghouse as PB-189 782, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 8 p, 1 tab, 3 fig, 2 ref. OWRR Project A-002-COLO.

Descriptors: *Snow management, *Snow pack, Snow, Snowfall.

Maximum snowpack water equivalent is measured at 123 points in the spring of 1966, 1967, and 1968. These points are distributed over three transects within a 4 square mile area in the Colorado Front Range. The north-facing slope ranges in elevation from 2900 to 3300 meters covered by Picea engelmanni and Abies lasiocarpa at the upper elevations and Pinus contorta at the lower. Water equivalent increases an average of 42mm/100m although only 28% of the total variance in water equivalent is associated with elevation. Forest cover measured by a Lemmon spherical densiometer within a cone of 114 deg is significant in only one of the three years. Neither corwn cover by compass quadrants, crown cover within a cone of 21 deg, not timber stand size classifications improve on the 114 deg cone canopy measurement in explaining snow accumulation variability. Individual points vary widely in their relative accumulation from year to year; the coefficient of determination for 1966 versus 1968 water equivalent is only 25%. Snow water equivalent versus snow depth gives r values of 0.86, 0.90, and 0.73 for the three years respectively.
W70-04056

CONTROLLED ACCUMULATION OF BLOWING SNOW,
Colorado State Univ., Fort Collins. Natural Resources Center.
J. L. Rasmussen.
Available from the Clearinghouse as PB-189 783, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Completion Report, June 13, 1969. 15 p, 8 ref. OWRR Project A-004-COLO.

Descriptors: *Snow management, Snowpack, *Snow fences, Water yield improvement.

An experiment designed to trap falling snow and control drifting snow over the high alpine regions of the Colorado Rocky Mountains is described. The experiment is based on the fact that a wind shift occurs following many snow occurrences over this region and a snow fence system was developed to act both as a trap for falling snow and as a channelling mechanism to control drifting snow. The report describes various fence designs that were tested and provides photographic evidence of the fence systsm's influence on the blowing snow. The system was effective in creasing the volume of snow in the target region but the density of snow in the controlled drift was found to be only eighty percent of the density in adjacent natural drift.

THE INFLUENCE OF FREEZING AND THAWING ON SOIL MOISTURE,
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
W. L. Pelton, C. A. Campbell, and W. Nicholaichuk.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan Univ, Nov 15-16, 1967, p 241-267, 1968. 27 p, 12 fig, 33 ref.

Descriptors: *Soil water movement, *Frozen soils, *Freezing, *Thawing, Soil moisture, Grasslands, Rainfall, Infiltration, Snowmelt, Snow, Runoff, Soil erosion, Moisture content, Permeability, Frost heaving.
Identifiers: *Canada, *Saskatchewan, Swift Current.

The influence of freezing and thawing on soil moisture is discussed in relation to the prairie region of Canada, where the rainfall is limited. Winter moisture can be conserved by trapping the snow on the soil surface and by infiltration of snowmelt into the soil. However, infiltration rates of frozen soil vary widely and depend upon the soil moisture content at the time of freezing. Soils which are dry during the fall are less susceptible to runoff and erosion in the spring than those which were frozen with high moisture content. Thermally induced moisture translocation is also a factor contributing to the reduction of infiltration rates. A literature review summarizes research findings related to permeability of frozen soils, moisture relocation, frost heaving and rate and depth of freezing and thawing. Field and laboratory studies of soil temperatures and moisture contents at Swift Current, Saskatchewan are presented. (Carstea-USGS)

THE ROLE OF STRESS CONCENTRATION IN SLAB AVALANCHE RELEASE,
Forest Service (USDA), Fort Collins. Rocky Mountain Forest and Range Experiment Station.
R. A. Sommerfeld.
Journal of Glaciology, Vol 8, No 54, p 451-462, 1969.

Descriptors: *Snow, *Avalanches, Mechanical properties, Snow management, Snowpacks, Colorado.
Identifiers: *Brittle fracture, Slab avalanches.

Slab avalanches are shown to be released by brittle fracture. An analogy is drawn in which the snowpack is considered to be a macroscopic, molecular model of glass. The analogy is examined qualitatively from two viewpoints: the Griffith fracture criterion, and stress concentration theory. The details of fracture propagation in a layered snowpack are explained by means of stress concentration theory, and many details of slab avalanches are shown to be consistent with the proposed mechanism. The significance of various fracture surface markings is pointed out.

2D. Evaporation and Transpiration

AN EXPERIMENTAL STUDY OF THE UPTAKE OF WATER BY SOYBEAN ROOTS,
Illinois Univ., Urbana. Dept. of Agronomy.
Arnold Klute.
Available from the Clearinghouse as PB-189 788, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Illinois Water Resources Center, Research Report No 29, Jan 1970. 32 p, 5 tab, 12 fig, 7 ref. OWRR Project A-023-ILL.

Descriptors: *Evapotranspiration, Evaporation, Transpiration, *Soil water movement, Unsaturated flow, Soil moisture, *Soil-water-plant relationships.
Identifiers: *Water uptake, Source function, *Root density.

The water extraction from soil by plant roots was treated by assuming that such extraction could be represented as a continuously distributed sink (negative source) function. Preliminary results with soybeans grown in soil columns showed that a small part of the root system could extract most of the water used in transpiration. Root density as measured by root length per unit volume of soil was not directly correlated with water uptake. Both the hydraulic conductivity of the soil and root density played a major role in determining the rate of extraction of water at a given depth in the soil. Water uptake per unit root length ranged up to about 0.5 cm3/cm of root/day. This kind of data gives more insight into the conditions at the root-soil interface. The experimental work in this project was developed from a numerical analysis which was supported by an earlier OWRR project (Project No. 65-03G), and is an example of a basic ap-

proach to the study of the interaction of the plant with its environment in which the available degree of understanding of the water flow process in soil is brought to bear upon the plant-soil interaction. The importance of evapotranspiration is well known in the hydrologic cycle. The experimental work described in this report makes a further contribution toward our understanding of this process.

COLD AIR DRAINAGE ON A FORESTED MOUNTAIN SLOPE,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
James D. Bergen.
J. Applied Meteor Vol 8, No 6, Dec 1969, p 884-895.

Descriptors: *Air circulation, Fluid mechanics, *Winds, Thermal radiation, Mountain climate, Climatology, Colorado.
Identifiers: *Katabatic flow, Mesoclimate.

The nocturnal cold airflow on a small forested slope was studied in an attempt to relate the volume and velocity of flow to the net radiation balance of the slope. The hillside, with an approximately 30% grade, was about 400 m long and covered with an uneven-aged spruce-fir stand of about 20 m height. The location was near Fraser, Colo., at an altitude of 3000 m. The vertical profiles of windspeed and air temperature were measured at various points on a transect approximating a streamline segment down the hill for several nights. Net radiation was measured at the base of the transect. Canopy closure and tree heights and diameters were measured on sample plots along the transect. The vertical profiles of potential temperature deficit and windspeed at the various station show approximate similarity when scaled by the height of the lowest inversion and by the average velocities and potential temperature deficits below that inversion. The latter varies in a nearly linear manner down the slope, and the inversion heights appear to be relatively constant over the range of net radiation rates observed. Assuming a corresponding analytical similarity for the equations of motion and the sensible heat balance, the last two phenomena are found to imply that U sub m varies as the one-half power of capital delta capital theta, capital delta capital theta varies as the two-thirds power of R sub o, and U sub m divided by the one-half power of gamma varies as chi where U sub m is the average velocity indicated above, capital delta capital theta the potential temperature drop down the slope, gamma the sine of the angle of the slope to the horizontal along the streamline, chi the downslope distance from the virtual origin of the flow measured along the streamline and R sub o the average net radiation loss on the slope. The data appear to confirm these results. The constants of proportionality calculated from the topographic contours, the estimated foliage distribution, and the scaled profiles of windspeed and potential temperature deficit are in fair agreement with observations.

2E. Streamflow and Runoff

STATISTICAL SUMMARIES OF ILLINOIS STREAMFLOW DATA,
Geological Survey, Champaign, Ill.
George W. Curtis.
Geological Survey Open-file report, 1969. 300 p, 1 fig, 1 append, index.

Descriptors: *Data collections, *Streamflow, *Hydrologic data, *Illinois, Statistics, Low flow, Hydrographs, Duration curves, Surveys.
Identifiers: Streamflow summary data, High flow.

Cooperative agreements between the U.S. Geological Survey and organizations of the State of Illinois for the systematic collection of streamflow records began in 1908. The data have been published in the form of daily discharges, and monthly and yearly summaries. A list of the publications (Water-Supply Papers) in which the records are published is given in the appendix. Three computer summaries of streamflow data given are of flow-duration, low-flow, and high-flow. This basic data release includes summaries for all gaging stations having five or more years of record as of September 30, 1966. The summary tables contain statistical information for 190 stations. SOME CHARACTERISTICS OF RIVER AND SPRING RUNOFFS IN THE KARSTIC AREAS OF ESTONIA (RUSSIAN),
T. F. Eypre.
In: Trudy Soveshchaniya po Voprosam Kompleksnogo Izucheniya Rezhima Poverkhnostnykh i Podzemnykh Vod v Karstovykh Rayonakh (Proc of Conf on Complex Problems of Surface and Groundwater Systems in Karstic Regions), Upravleniye Gidrometeorologicheskoy Sluzhby, Ukr, SSR, p 96-106, 1969. 10 p, 2 fig, 5 tab, 7 ref

Descriptors: *Runoff, *River flow, *Springs, *Karst, Mapping, Gaging stations, Watersheds (Basins), Frequency, Discharge (Water), Water resources, Seasonal, Dry seasons, Water resources development.
Identifiers: *USSR, Estonia.

Hydrological characteristics of the rivers and springs of the karstic highlands of Estonia were investigated. Areas characterized by large mean annual discharges and the presence of some internal regularity were identified. It is recommended that the future water supply for the city of Tallin, Estonia, should be drawn from the total discharge of the rivers and springs characterized by positive karstic feeding. MAGNITUDE AND FREQUENCY OF MISSOURI FLOODS,
Geological Survey, Rolla, Mo. Water Resources Div.
E. H. Sandhaus, and John Skelton.
Water Resources Report 23, Missouri Geological Survey and Water Resources, Dec 1968. 276 p, 7 fig, 1 plate, 2 tab, 14 ref, 2 append.

Descriptors: *Floods, *Missouri, *Data collections, *Statistics, Statistical methods, Frequency analysis, Flood forecasting, Stage-discharge relations, Streamflow, Climates, Topography, Regression analysis.
Identifiers: Flood data, Flood frequencies.

A statistical analysis was made of available flood-flow information from streams in the State of Missouri. Equations are presented for estimating the magnitude of future floods with recurrence intervals of 1.2, 2.33, 5, 10, 25, and 50 years at ungaged sites on most Missouri streams. Only two basin characteristics, drainage area and the average slope of the stream, are required to solve the equations. Appendices contain information on peak stages and discharges at gaging stations and miscellaneous sites, and flood-frequency data for gaging stations. (Knapp-USGS)

SIMULATION OF DAILY STREAMFLOW,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Beard.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 78, p 624-632, 1967. 9 p, 5 tab, 4 ref.

Descriptors: *Synthetic hydrology, *Statistical models, *Stochastic processes, *Streamflow forecasting, Markov processes, Statistical methods, Correlation analysis, Regression analysis, Simulation analysis.
Identifiers: Daily streamflow model, Watershed models.

The stochastic process of daily streamflow generation is represented by a mathematical model including more than one element of serial correlation

and a random component in the generation of a daily streamflow. Differences in statistical and correlation characteristics between high flows and low flows are evaluated and tested. A generalized equation for generating daily streamflow at a single location is suggested. (Knapp-USGS)

CHANNEL CAPACITY AND FLOOD CHARACTERISTICS FOR SELECTED REACHES OF ELK CREEK AND TRIBUTARIES, DOUGLAS COUNTY, OREGON,
Geological Survey, Portland, Oreg.
Eugene A. Oster, and C. H. Swift, III.
Geological Survey Open-file Report, Oct 1969. 284 p, 256 fig, 1 plate, 3 tab, 2 ref.

Descriptors: *Floods, *Oregon, *Stage-discharge relations, *Data collections, Profiles, Hydrologic data, Hydrographs, Hydrograph analysis, Streamflow, Depth-area-duration analysis, Duration curves.
Identifiers: *Flood data, Douglas County (Oregon).

A study was made of the channel capacity and flood characteristics for selected reaches of Elk Creek and two of its tributaries, Pass and Yoncalla Creeks, Oregon. Water-surface profiles and the area inundated by floods with 2-year and 10-year recurrence intervals, and by the maximum flood of record, which occurred February 10, 1961, were made. The step-backwater method was used to define the flood profiles needed for delineating the areas inundated. Cross sections, high-water profiles, and other data used to develop the flood profiles are presented. (Knapp-USGS)

EFFECT OF WATERSHED COVER ON OVERLAND FLOW FROM A MAJOR STORM IN SOUTHWESTERN WISCONSIN,
Forest Service (USDA), La Crosse, Wis.
Richard S. Sartz.
Forest Service Research Note NC-82, 1969. 4 p, 2 fig, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Vegetation effects, *Wisconsin, Runoff forecasting, Streamflow forecasting, Alfalfa, Forests, Peak discharge, Hydrographs, Hydrograph analysis, Rainfall intensity.
Identifiers: Driftless Area (Wis).

A runoff study in the Driftless Area of Wisconsin showed that both total flow and peak rate of flow from a 3-hour, 4-inch rain were strongly affected by the watershed cover. Peak flows ranged from 2.42 inches per hour for alfalfa meadow to .010 inch per hour for undisturbed forest. The timing of flow on open-land and forested watersheds was similar. (Knapp-USGS)

THE INTERACTION OF INTERNAL WAVES WITH AN UNSTEADY NON-UNIFORM CURRENT,
Johns Hopkins Univ., Baltimore, Md. Dept. of Mechanics.
Yee-Chang Wang.
Journal Fluid Mechanics, Vol 37, Part 4, p 761-771, July 28, 1969. 11 p, 7 ref, 3 append.

Descriptors: *Waves (Water), *Ocean currents, *Non-uniform flow, *Unsteady flow, Hydraulics, Mathematical studies, Stratification, Thermocline, Ocean circulation, Thermal stratification.
Identifiers: Incompressible flow.

On the assumptions of incompressibility, negligible thermal conduction, salinity diffusion and viscosity, simple expressions are derived for the conservation equations of mass, momentum and energy when internal waves encounter an unsteady non-uniform current. These expressions of conservation equations are valid for all kinds of internal waves without regard to their different characteristics. From the dynamical conservation equations, we find that a stress-like term, the 'excess momentum flux tensor,' plays an important role in the interaction between internal waves and an unsteady non-uniform current. Furthermore, it is deduced from the energy balance equation that, in the encounter of interfacial waves with a steady non-uniform current in a two-liquid system, the waves are amplified in an adverse current but suppressed in an advancing current as a result of interaction of the waves with the current. This conclusion may explain the large amplitudes sometimes observed in internal waves near the confluence of currents and near fronts at the thermocline, the region in the ocean where the density gradient is a maximum. (Knapp-USGS)

SURFACE WATER RESOURCES OF SOUTH AFRICA,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Civil Engineering.
D. C. Midgley, and W. V. Pitman.
Witwatersrand University Hydrological Research Unit Report No 2/69, Aug 1969. 127 p, 29 fig, 23 tab, 22 ref, 7 append.

Descriptors: *Water resources, *Water resources development, *Surface waters, Streamflow, Rainfall-runoff relationships, Water storage, Hydrologic data, Data collections, Hydrogeology, Duration curves, Depth-area-duration analysis, Hydrographs, Frequency analysis, Flow characteristics, Low flow, Evaporation, Sedimentation, Silting, Mass curves.
Identifiers: *South Africa.

All comparatively long and reliable South African streamflow records that are reasonably unaffected by changing upstream land use were analyzed. Drought-flow sequences were abstracted and subjected to extreme-value analysis to yield critical mass curves as functions of return period. Discrete values are tabulated and referred to a regional drought-characteristic map. Storage analyses of the critical mass curves yield generalized co-axial diagrams relating gross draft, recurrence interval, month of year, and storage requirement. A generalized diagram is provided for each drought-characteristic region. Rainfall-runoff relationships were found to be influenced more strongly by vegetal cover than by any other catchment characteristic. The main drainage systems of the Republic were subdivided into secondary, tertiary and quaternary subcatchments. From regional rainfall-runoff relationships and isohyetal maps, mean river flow was computed for each quaternary subcatchment. (Knapp-USGS)

RESERVOIR FLOOD ROUTING ANALYSIS,
Sheffield Univ. (England).
E. J. Sarginson.
Civ Eng Pub Works Rev, Vol 64, No 752, p 275-277, Mar, 1969. 2 p, 3 fig, 2 tab, 4 ref.

Descriptors: Flood control, Reservoirs, *Flood routing, Flood peaks, *Flood hydrographs, Mathematical analysis, Reservoir storage, Floods, *Reservoir operation, Discharges, Flow rates, Regulation, Foreign design practices.
Identifiers: *Flood hydrology, Flood stages, *Reservoir management, Accuracy, Great Britain.

Using an arithmetical integration is the usual procedure for routing a flood of variable intensity through a reservoir. The procedure is tedious when a large number of short steps must be considered for accuracy. A more rapid analytical solution is desirable. Floods of constant intensity are solved easily in terms of Gould's function, and Mathieson has extended the method to include reservoirs in which the surface area increases with rising water level. For a flood of variable intensity, an analytical solution is not managed easily. A method is presented for calculating a rising flood using the weir formula in the usual form. Gould's function is recommended for the constant part of the flood hydrograph. A further method is developed for the falling flood. An example of the proposed routing analysis method gives a solution identical to results of the more lengthy arithmetical procedure. (USBR)

GROUNDWATER RESOURCES OF GREGG AND UPSHUR COUNTIES, TEXAS,
Geological Survey, Austin, Tex.
Matthew E. Broom.
Report published and distributed by Texas Water Development Board, PO Box 12386, Austin Tex 78711. Texas Water Development Board Report 101, Oct 1969. 76 p, 16 fig, 9 tab, 41 ref.

Descriptors: *Water resources, *Groundwater, *Aquifers, *Texas, Water wells, Water yield, Transmissivity, Water quality, Data collections, Hydrologic data, Hydrogeology, Water levels.
Identifiers: Gregg County (Tex), Upshur County (Tex).

Gregg and Upshur Counties, in northeast Texas, are underlain by two aquifers that are capable of sustaining additional development. The aquifers consist of the Wilcox Group and Carrizo Sand (Carrizo-Wilcox aquifer) and the Queen City Sand. Of the total pumpage of 3.02 mgd in 1966, 2.84 mgd was from the Carrizo-Wilcox aquifer. At the 1966 hydraulic gradient (8 feet per mile), about 12,000 acre-ft per year (10.9 mgd) was being transmitted through this aquifer. The amount that is perennially available is not known, but it is probably at least two times that pumped in 1966. The water in the Carrizo-Wilcox generally is soft,

but with high chloride content. The Queen City Sand, which crops out over nearly 90% of the area, is relatively undeveloped. In 1966, only 200 acre-ft (0.18 mgd) was pumped from the aquifer. The transmissibility of the aquifer is about 5,000 gpd per foot as compared to 20,000 gpd per foot for the Carrizo-Wilcox. The water in the Queen City Sand is uniformly low in mineralization except for iron. (Knapp-USGS)
W70-04092

GROUNDWATER RESOURCES OF KERR COUNTY, TEXAS,
Geological Survey, Austin, Tex.
Richard D. Reeves.
Report published and distributed by Texas Water Development Board, PO Box 12386, Austin, Texas 78711. Texas Water Development Board Report 102, Nov 1969. 58 p, 12 fig, 7 tab, 30 ref.

Descriptors: *Water resources, *Groundwater, *Aquifers, *Texas, Water wells, Water yield, Transmissivity, Water quality, Data collections, Hydrologic data, Hydrogeology, Water levels.
Identifiers: Kerr County (Tex).

The principal water-bearing units in Kerr County, Texas, are the Hosston and Sligo Formations, the Hensell Member of the Pearsall Formation, and the Edwards and associated limestones. The Glen Rose Limestone is of lesser importance. A total of about 3,600 acre-feet or 3.2 mgd of groundwater was pumped from wells in 1966. Additional groundwater is available for development. An average of about 52,000 acre-feet per year is discharged from the Edwards and associated limestones through springs and seeps. An additional 6,000 acre-feet is discharged from the upper member of the Glen Rose Limestone. However, a substantial increase in withdrawals from the Edwards and associated limestones would necessarily result in a reduction in the natural groundwater discharge, which in turn would result in a reduction in the base flow of the Guadalupe River. The chemical quality of the groundwater in the aquifers is generally suitable for public supply and industrial use, and is excellent for irrigation. (Knapp-USGS)
W70-04093

WATER RESOURCES AND DEVELOPMENT IN MASON VALLEY, LYON AND MINERAL COUNTIES, NEVADA, 1948-65,
Geological Survey, Carson City, Nev.
C. J. Huxel, Jr., and E. E. Harris.
Nevada Division of Water Resources Bulletin No 38, 1969. 77 p, 13 fig, 3 plate, 26 tab, 30 ref.

Descriptors: *Water resources development, *Nevada, *Groundwater, Surface waters, Conjunctive use, Water supply, Irrigation water, Water yield, Water wells, Aquifers, Alluvium, Specific capacity.
Identifiers: Mason Valley (Nev).

Mason Valley comprises 510 square miles in the Walker River basin of western Nevada. Precipitation ranges from about 5 inches per year on the valley floor (altitude 4,700-4,300 feet) to about 20 inches in the surrounding mountains. The Mason Valley floor is underlain by a thick sequence of alluvium and fan deposits that form the principal aquifer in the valley. The alluvium contains sand and gravel with transmissibilities in the range from 50,000 to 200,000 gpd per foot, and specific yields of about 20%. The total amount of water stored in the uppermost 50 feet of saturation is about 1,100,000 acre-feet. East and West Walker Rivers contributed an average of 216,000 acre-feet per year during the period 1948-65. Conjunctive use of surface and groundwater, together with salvage of natural water losses, would yield as much as 100,000 acre-feet per year. (Knapp-USGS)

B. A. Korzhenevskiy.
In: Trudy Soveshchaniya po Voprosam Kompleksnogo Izucheniya Rezhima Poverkhnostnykh i Podzemnykh Vod v Karstovykh Rayonakh (Proc of Conf on Complex Problems of Surface and Groundwater Systems in Karstic Regions), Upravleniye Gidrometeorologicheskoy Sluzhby, Ukr, SSR, p 60-63, 1969. 4 p.

Descriptors: *Karst, *Aquifers, *Groundwater, *River basins, Geology, Crystalline rocks, Sedimentary rocks, Fissures (Geology), Boreholes, Limestones, Erosion, Weathering.
Identifiers: *USSR, Donets Basin.

General and historical geology are used in analysis of aquifers of the karstic area located in the southwestern part of the Donets Basin. In this area four water-bearing horizons are identified as follows: (1) Crystalline rocks and the products of their weathering; (2) Devonian fissure-bearing rocks (sandstones, slates, conglomerates); (3) Lower Carbonaceous limestones and sands; and (4) Pre-Tertiary sand and clay formations. Karstic processes in this area are associated with the Lower Carbonaceous limestones. (Gabriel-USGS)

In: Trudy Soveshchaniya po Voprosam Kompleksnogo Izucheniya Rezhima Poverkhnostnykh i Podzemnykh Vod v Karstovykh Rayonakh (Proc of Conf on Complex Problems of Surface and Groundwater Systems in Karstic Regions), Upravleniye Gidrometeorologicheskoy Sluzhby, Ukr, SSR, p 84-90, 1969. 7 p, 1 fig, 3 tab, 2 ref.

Descriptors: *Groundwater movement, *Aquifers, *Hydrogeology, Geology, Topography, Water sources, Discharge (Water), Climates, Boreholes, Water level fluctuations, Air temperature, Rivers, Seasonal, Filtration, Floods, Velocity, Precipitation (Atmospheric), Water balance.
Identifiers: Lugansk region, USSR.

The groundwater regime of the Lugansk region was investigated by using the Forchheimer equation and borehole data to calculate the effect of floods on water level fluctuations. The whole region may be considered as a source for the accumulation of the groundwater. The main source of Upper Cretaceous groundwater is the infiltration of atmospheric precipitation. In general, the amplitude of water level fluctuations depends on the amounts of precipitation, evaporation, the thickness of the aeration zone, and permeability. (Gabriel-USGS)

Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 83-90, 1967. 8 p, 2 fig, 1 tab, 6 ref.

Descriptors: *Seepage, *Canals, *Recharge, *Analog models, Aquifers, Aquicludes, Model studies, Hydrogeology, Discharge (Water), Water yield, Water wells, Infiltration, Groundwater movement, Saline water intrusion.
Identifiers: *USSR.

The fresh-water lenses which are formed near large canals are as a rule hydraulically connected with the canal and located immediately over an aquicludes. For such conditions, a technique is presented for evaluating the workable resources when a linear water intake is located along canals. Analytical calculation methods and application of the modelling methods are described. For the 'hanging' lenses, approximate methods of calculation and methods of modelling, using solid and net-like electrical models, are presented. Also, the technical problems of hydrogeological investigations required for determining the initial hydrogeological parameters are discussed. (Knapp-USGS)

A GENERALIZED THEORY ON HYDRODYNAMIC DISPERSION IN POROUS MEDIA,
Technion - Israel Inst. of Tech., Haifa; and Water Planning for Israel Ltd., Tel Aviv.
J. Bear, and Y. Bachmat.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (Mar 19-26, 1967), International Association of Scientific Hydrology, Pub No 72, p 7-16, 1967. 10 p, 3 ref.

Descriptors: *Dispersion, *Flow, *Porous media, *Groundwater movement, *Tracers, Dye releases, Salts, Ion transport, Diffusion, Mathematical models, Mass transfer, Solutes, Aqueous solutions.
Identifiers: Hydrodynamic dispersion.

The phenomenon of hydrodynamic dispersion occurs in problems of underground mixing of waters of different quality. In these problems, any identifiable solute may serve as a tracer if its concentration distribution indicates the mixing. A review is given of the microscopic and macroscopic factors of the medium and the liquid, which affect the mixing phenomenon. A generalized macroscopic dispersion theory is based on the hydrodynamics of the microflow through a porous medium model and on statistical averaging procedures. The macroscopic parameters appearing in the averaged transport equations and their interrelations are analyzed. The problem of determining the tracer concentration distribution under field conditions is stated mathematically in the form of a set of equations with boundary and initial conditions. (Knapp-USGS)

MOJAVE RIVER BASIN GROUNDWATER RECHARGE WITH PARTICULAR REFERENCE TO THE CALIFORNIA FLOODS OF JANUARY AND FEBRUARY 1969,
Geological Survey, Menlo Park, Calif.
William F. Hardt.
Geological Survey Open-file Report, Dec 17, 1969. 13 p, 3 fig, 2 tab, 5 ref.

Descriptors: *Recharge, *Alluvium, *California, *Floods, Water spreading, Surface-groundwater relationships, Infiltration, Flooding, Water levels, Water level fluctuations, Hydrographs, Hydrologic budget, Water balance, Evapotranspiration.
Identifiers: Mojave River (Calif).

The floods of January and February 1969 in the Mojave River basin, California caused about $6 to $12 million damage. The floods also produced substantial benefits in recharge of the underlying aquifer at no capital cost. Aquifer recharge from March 1967 through March 1969 was about 300,000 acre-feet from surface flow in the Mojave River between The Forks and Afton Canyon. During the study period, consumptive use and pumping adjacent to the river was about 190,000 acre-ft. About 210,000 acre-ft of floodflow from January through March 1969 recharged the aquifer. This was the equivalent of about 2 years of normal water use. The change in storage for the basin was a net accretion of about 110,000 acre-ft. The value of the recharged water was about $18 million for the 25-month period. Consideration might be given to artificial diversion of controlled floodflow for recharge to the basin. Groundwater pumpage in the basin exceeds average natural recharge from flow in the Mojave River. Floodflows are highly unpredictable and give only temporary relief to the long-term continuous lowering of water levels. (Knapp-USGS)
W70-04323

DIFFUSION FROM A GASEOUS SOURCE IN A POROUS MEDIUM - A FIELD AND THEORETICAL COMPARISON,
Geological Survey, Idaho Falls, Idaho.
John B. Robertson.
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75 per copy. Geological Survey Research 1969, Professional Paper 650-D, p D265-D273, 1969. 9 p, 5 fig, 5 ref.

Descriptors: *Diffusion, *Porous media, Groundwater movement, Tracers, Tracking techniques, Radioisotopes, Gases, Mathematical studies, Model studies, Laboratory tests.
Identifiers: *Gaseous diffusion, Tracer dispersion.

Small volumes of air containing a radioactive krypton-85 tracer were injected into fine-grained sediments at the National Reactor Testing Station, Idaho. Dissipation of the Kr-85 gas away from the injection points was observed by recording the gamma radioactivity in the holes. A mathematical model was adapted from a heat-flow analogy to estimate the amount of molecular diffusion occurring in the system. The observed field data match the theoretical diffusion curves closely, indicating that most of the observed outflow was due to diffusion. (Knapp-USGS)

COMPARISON OF LABORATORY AND FIELD ANALYSES OF AQUIFER AND WELL CHARACTERISTICS AT AN ARTIFICIAL RECHARGE WELL SITE,
Geological Survey, Denver, Colo.; and Geological Survey, Little Rock, Ark.
A. I. Johnson, and R. T. Sniegocki.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 182-192, 1967. 11 p, 4 fig, 14 ref.

Descriptors: *Artificial recharge, *Recharge wells, Surveys, Aquifers, Observation wells, Alluvium, Sands, Gravels, Laboratory tests, Permeability, Transmissivity, Particle size, Storage coefficient, Specific capacity.
Identifiers: *Aquifer testing, Pumping tests.

Research on artificial recharge of alluvial deposits by means of recharge wells was carried out in the Grand Prairie region of Arkansas. Extensive test-drilling and construction of observation wells within the 24sq mi research site provided detailed information on the geology and hydrology of the deposits of Quarternary Age. Aquifer characteristics were determined by means of laboratory analysis of samples collected from the pilot test holes for the recharge wells and by conventional pumping-test in the field. On the basis of the laboratory analyses, a transmissibility of 60,000 gpd/ft, and a storage coefficient of 0.34 was predicted for the recharge test site. Later pumping tests and recharge tests in the field confirmed that the values of transmissibility predicted from laboratory analysis were comparable to those obtained by the field test. Slow drainage from the fine-textured portions of the aquifer resulted in a change in storage coefficient with time. However, the field data showed that the storage coefficient probably would have reached the value predicted by laboratory analyses if the field test had been run for a much longer period of time. HYDROGEOLOGICAL INVESTIGATIONS AND ESTIMATION OF FRESH GROUNDWATER RESOURCES IN COASTAL AREAS,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
V. D. Babushkin, and V. M. Goldberg.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 383-389, 1967. 7 p, 1 ref.

Descriptors: *Hydrogeology, *Aquifers, *Coasts, *Saline water-freshwater interfaces, *Surveys, Water resources development, Water management (Applied), Saline water intrusion.
Identifiers: Coastal fresh-water lenses.

The hydrogeological conditions of coastal fresh groundwaters are discussed and characterized schematically. The principles of estimating the exploitation resources of coastal fresh groundwater are given, salt water encroachment is taken into account, and design factors of concentrated and linear water intakes are presented. The problems of hydrogeological investigations, and the techniques of exploration and estimation of fresh groundwater resources in coastal areas are discussed. (Knapp-USGS)

USE OF AIR TO INFLUENCE GROUNDWATER MOVEMENT,
Dames and Moore, San Francisco, Calif.
George D. Roberts.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 390-398, 1967. 9 p, 4 fig, 5 ref.

Descriptors: *Saline water intrusion, *Aquifers, *Coasts, *Groundwater barriers, Groundwater movement, Water management (Applied), Aeration, Saturation, Unsaturated flow.
Identifiers: *Saline water barriers, Air barriers, Saline water intrusion control.

Air may be utilized as a barrier to the migration of saline, or other contaminated waters, where the proper permeability and geologic structure conditions are present. The advantages of an air barrier are: the availability of air, which eliminates the need for pipelines or other means of water conveyance to injection wells; the ease of maintaining the air barrier; and the comparatively low cost of the operations. The great variety of topography, stratigraphy, structural conditions, permeability, and the depth at which the barrier is to be installed and maintained will all have important effects upon the design and operation of such an installation. The well-developed techniques employed to repressurize oil and gas fields, as well as those for the storage of 'off-peak' natural gas in natural underground reservoirs from transmission lines, are reviewed. All who have been afflicted with an air-locked well will attest to the effectiveness of air in decreasing the permeability. Some laboratory data are presented which indicate the effectiveness of air under varying pressures and permeability. (Knapp-USGS)

GROUNDWATER LEVELS IN NEW MEXICO, 1965, AND CHANGES IN WATER LEVELS, 1961-1965,
Geological Survey, Washington, D.C.
F. E. Busch, and J. D. Hudson.
New Mexico State Engineer, Technical Report 34, 1967. 124 p, 44 fig, 40 tab, 49 ref.

Descriptors: *Water levels, *New Mexico, *Irrigation effects, *Groundwater, *Drawdown, Watersheds (Basins), Water table, Observation wells, Hydrologic data, Monitoring, Data collections.
Identifiers: *Periodic measurements.

Periodic water level measurements in New Mexico are taken in a network of observation wells in areas of heavy groundwater use. There are about 1,500 of these wells in seven major drainage basins or groups of basins. An estimated 90% of all groundwater use in New Mexico is for irrigation. Of the 1,063,000 acres irrigated in the state in 1965, about 587,000 acres were irrigated with groundwater only, 150,000 acres were irrigated with a combination of surface and groundwater, and 326,000 acres were irrigated with surface water only. Extensive groundwater use for irrigation has lowered water levels in most of New Mexico's irrigated areas. This trend continued during the 1961-65 period. The maximum one-year decline in 1965 was 7 feet and the maximum 1961-65 decline was 53 feet. (Carr-Arizona)
W70-04390

QUANTITATIVE ANALYSIS OF WATER RESOURCES IN THE ALBUQUERQUE AREA, NEW MEXICO; COMPUTED EFFECTS ON THE RIO GRANDE OF PUMPAGE OF GROUNDWATER, 1960-2000,
Geological Survey, Washington, D.C.
H. O. Reeder, L. J. Bjorkland, and G. A. Dinwiddie.
New Mexico State Engineer, Technical Report 33, 1967. 34 p, 5 fig, 2 tab, 11 ref.

Descriptors: *Groundwater movement, *Rio Grande, *Drawdown, *Infiltration, *New Mexico, Hydraulic gradient, River flow, Water table, Water demand, Pumping, Hydrogeology, Sedimentation.
Identifiers: *Albuquerque, New Mexico.

Future lowering of water levels in the Albuquerque area was computed from the basic assumptions of water requirements and aquifer characteristics. The greatest decline in water level - 86 feet - is expected to occur under the east mesa. The most significant anticipated effects of this water-level decline are: (1) the reversal of the water-table gradient east of the Rio Grande, causing groundwater to flow away from the river, and (2) the eastward movement of groundwater from the Rio Grande, increasing the quantity of pumped water derived from the river. Roughly 80% of the water pumped by the city in the 1920-1960 period was derived from the flow of the Rio Grande, but development of new wells distant from the river will keep the percentage from increasing. (Carr-Arizona)

HYDROGEOLOGICAL INVESTIGATIONS IN THE WESTERN CATCHMENT OF THE RED SEA,
Geological Survey of Israel, Jerusalem; and Water Planning for Israel Ltd., Tel Aviv.
A. Arad, and A. Michaeli.
Israel Journal of Earth-Sciences, Vol 16, p 181-197, 1967. 10 fig, 2 tab, 11 ref.

Descriptors: *Hydrogeology, *Aquifers, *Groundwater, *Groundwater recharge, *Geology, Precipitation (Atmospheric), Percolation, Sandstones, Watersheds (Basins), Withdrawal, Water balance, Wells, Geochemistry, Water chemistry, Recharge.
Identifiers: *Israel, *Dead Sea Basin, Hydrogeochemistry.

The hydrogeological study evaluates the groundwater balance of the western catchment of the Dead Sea Basin. The 2700 sq km area receives the major portion of its water by percolation from precipitation in the Judean Hills. It also receives some water from rainstorms in the Judean Wilderness. The annual regimal groundwater recharge amounts to between 70 and 100x10 super 6 cm super 3, but exploitation of the Dead Sea Basin aquifers withdraws more water than is replenished. These aquifers rely primarily on the enormous storage in the Lower Cretaceous Nubian Sandstone formation. As a further complication, long-term precipitation records from Jerusalem show a general quantitative decline in rainfall over the past one hundred years. (Carr - Arizona)

2G. Water in Soils

THE VALIDITY OF SOIL-WATER DIFFUSIVITY THEORY FOR HORIZONTAL WATER ABSORPTION,
Purdue Univ., Lafayette, Ind.
David L. Nofziger.
Master of Science Thesis, Purdue Univ, Jan 1970. 67 p, 2 tab, 15 fig, 40 ref. OWRR Project A-010-IND.

Descriptors: *Soil water, Soil physics, *Soil water movement, Permeability, *Diffusivity, Porous media, *Darcy's Law, *Density bulk, *Gamma rays, Absorption.
Identifiers: Particle movement, *Gamma ray attenuation, Water content gradient, Water flux.

The theory of soil-water diffusivity is normally used to describe absorption of water by a horizontal soil column. Deviations from theory have been noted wherein the water-flux increases more than proportional with the water-content gradient. A study was made for possible cause of these deviations. Transient water-content measurements were made by gamma-ray attenuation. A silt loam soil with both low and high bulk densities showed marked deviations from theory for positions near the water-inlet, but decreased with further-distant positions. Since deviations occurred at both soil densities, the possibility of particle rearrangements being the cause was discarded.

STORM RUNOFF FROM FORESTED CATCHMENTS BY SUBSURFACE ROUTES,
Forest Service (USDA), Columbus, Ohio. Northeastern Forest Experiment Station.
R. Z. Whipkey.
Floods and Their Computation, Proceedings of the Leningrad Symposium, Int'l Assoc Sci Hydrology, p 773-779, Aug 1967.

Descriptors: *Subsurface runoff, *Subsurface flow, *Hydrologic properties, *Hydraulic conductivity, Soils, Permeability, Watershed management, Hydraulics, Hydraulic properties, Hydraulic gradient, Soil physical properties, Soil water movement.

Subsurface stormflow (quick interflow) is a major source of high stream stages from wetted, unfrozen forest soils. Field plot and small watershed studies showed greatest quantities of discharge from fine-textured soils and least from coarse-textured soils which have an inherently greater hydraulic conductivity. Large biological channels, structural planes and channels in fine-textured soils were found to be important water-conduction sources, but their overall importance in watershed discharge is not known. Preliminary plot treatments using subsoiling and trenching techniques to break hydraulic continuum of bedding planes and soil channels reduced subsurface stormflow from the wetted regions above the trenches.

THE CONTINUITY BETWEEN GROUNDWATER FLOW SYSTEMS AND FLOW IN THE UNSATURATED ZONE,
Department of Energy, Mines and Resources, Calgary (Alberta). Inland Waters Branch.
R. Allan Freeze.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan Univ, Nov 15-16, 1967, p 205-240, 1968. 36 p, 7 fig, 1 tab, 34 ref.

Descriptors: *Groundwater movement, *Saturated flow, *Unsaturated flow, *Soil water movement, Infiltration, Evaporation, Groundwater recharge, Equations, Dimensional analysis, Steady flow, Unsteady flow, Compressible flow, Pressure head, Watersheds (Basins), Water level fluctuations.
Identifiers: *Canada, *Saskatchewan, Good Spirit Lake, Soil water-groundwater relationships.

There is a physical and mathematical continuity between unsaturated flow processes of infiltration and evaporation and saturated processes of groundwater recharge and discharge. A generalized flow equation which describes both saturated and unsaturated flow is derived. From this equation, it is possible to develop the one, two, or three-dimensional forms of the steady or unsteady flow equations for saturated or unsaturated flow of a compressible or incompressible fluid through a nonhomogeneous, anisotropic porous medium. The solutions for one-dimensional, vertical, unsaturated, and unsteady flow are reviewed. A mathematical model was developed to examine the mechanisms which control the continuous moisture flow from the soil surface to a point within the groundwater flow pattern. It is shown that the pressure head, total head, and moisture content profiles in the unsaturated zone are dependent upon the conditions of groundwater recharge and discharge. Water table fluctuations result when the rate of groundwater recharge or discharge is not matched by the rate of infiltration or evaporation in the unsaturated zone. Measurements at a recharge-discharge site in the Good Spirit Lake drainage basin, Saskatchewan, appear to be in accord with the theoretical treatment. (Carstea-USGS)

SOIL MOISTURE - INSTRUMENTATION, MEASUREMENT AND GENERAL PRINCIPLES OF NETWORK DESIGN,
Guelph Univ. (Ontario). Dept. of Soil Science.
K. M. King.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan Univ, Nov 15-16, 1967, p 269-285, 1968. 17 p, 55 ref.

Descriptors: *Soil moisture, *Instrumentation, *Nuclear moisture meters, *Moisture content, *Moisture tension, Infiltration, Runoff, Soil moisture meters, Storage, Evapotranspiration, Soil water movement, Dissolved solids, Groundwater recharge, Analytical techniques, Tensiometers, Gamma rays, Electrical resistance.
Identifiers: Neutron scattering method, Gamma ray attenuation.

Various instruments and techniques may be used to measure the status of water in soil. Several of these are described and evaluated. For inventory purposes, it is necessary to know the change in soil moisture content of the root zone and the flow of water into and out of this zone. The neutron scattering method appears to be the best available for determination of soil moisture content on a network basis. Possible errors in the method are described in detail and suggestions and precautions are given on its use for field measurements. (Carstea-USGS)

APPLICATION OF THERMODYNAMICS TO SOIL MOISTURE,
Saskatchewan Univ. (Saskatoon). Dept. of Soil Science.
E. De Jong.
Proceedings of Hydrology Symposium No 6 on Soil Moisture, Saskatchewan Univ, Nov 15-16, 1967, p 25-49, 1968. 25 p, 2 fig, 3 tab, 25 ref.

Descriptors: *Soil moisture, *Thermodynamics, *Thermodynamic behavior, *Soil water movement, Free energy, Capillary water, Surface waters, Entropy, Enthalpy, Equations, Moisture tension.
Identifiers: *Soil water retention curves, Linear phenomenological laws, Onsager's reciprocal relationships.

A brief review is given of the fundamental equations of thermodynamics and the theory is then extended to the retention and movement of water in soils. At equilibrium, the partial molar free energy is the same everywhere and, based on this, a working equation describing the forces of moisture retention is derived. This equation can be used to clarify the principles behind several methods of determining the soil moisture retention curve or determining the capillary potential. If the system is not too far from equilibrium, irreversible thermodynamics, based on the linear phenomenological laws and Onsager's reciprocal relationships, can be used to describe the simultaneous movement of many components. An example of the application of irreversible thermodynamics to fluxes in soils is given and the advantages of this approach over the empirical linear laws are pointed out. (Carstea-USGS)
W70-04117

ON THE STORAGE COEFFICIENT OF FREE SURFACE AQUIFERS, CONSIDERING THE FLOW IN THE UNSATURATED ZONE (FRENCH),
Grenoble Univ. (France).
Georges Vachaud.
English summary included. Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 69-82, 1967. 14 p, 12 fig, 2 tab, 11 ref.

Descriptors: *Specific yield, *Storage coefficient, *Aquifers, Soil water, Permeability, Porosity, Specific retention, Water storage, Water yield, Water level fluctuations, Water table, Unsaturated flow.
Identifiers: Unsaturated zone.

The assumption that specific yield is the volume of water drained from an aquifer when the water table is lowered has no theoretical basis. It neglects flow in the unsaturated zone above the aquifer. During drainage or recharge, the moisture profile above the water table will tend toward a limit given by capillary pressure-moisture content curves. Storage coefficient, the ratio of water yield to volume of soil drained, reaches a constant value after a period of time depending on permeability. Furthermore, the limit is a function of drawdown, and storage is equal to specific yield only for very large drawdown. With equilibrium conditions, the storage coefficient varies, dependent on initial depth of the water table and on drawdown, to a critical depth at which the value of suction is equal to the residual moisture content, and below which the storage coefficient is constant. Values of storage coefficient are plotted against drawdown and initial water table depth for several soils. (Knapp-USGS)

MEASUREMENT OF ATMOSPHERIC PRESSURE AND SUBSURFACE-GAS PRESSURE IN THE UNSATURATED ZONE OF THE BANDELIER TUFF, LOS ALAMOS, NEW MEXICO,
Geological Survey, Santa Fe, N. Mex.
J. L. Kunkler.
Available from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $3.75 per copy. Geological Survey Research 1969, Professional Paper 650-D, p D283-D287, 1969. 5 p, 7 fig, 2 ref.

Descriptors: *Pressure, *Gases, *Monitoring, *Waste disposal, *Injection wells, Unsaturated flow, Soil water, Soils, Aquifers, New Mexico, Radioactive wastes, Radioactive waste disposal.
Identifiers: Los Alamos (N Mex), Bandelier Tuff, Gas disposal.

Pressure transducers, power supplies, and potentiometric recorders were assembled into portable pressure-monitoring systems which measured pressures in the field with an accuracy of about 0.3%. The performance of some of the components was affected by fluctuations in field temperatures; hence these components were operated in a constant-temperature chamber. Subsurface-gas pressures responded to changes in the atmospheric pressure to depths of 35 meters in the Bandelier Tuff; the response was completely attenuated at some depth between 35 and 89 m. (Knapp-USGS)

DIFFERENCES IN SOIL CHEMISTRY INDUCED BY EVAPORATION AND FLOW OF GROUNDWATER,
Geological Survey, Denver, Colo.
Reuben F. Miller.
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75 per copy. Geological Survey Research 1969, Professional Paper 650-D, p D255-D259, 1969. 5 p, 5 fig, 7 ref.

Descriptors: *Water chemistry, *Groundwater, *Surface waters, *Evaporation, *Ion exchange, Groundwater movement, Grasslands, Leaching, Drainage, Runoff, Saline water, Saline water systems, Saline soils, Soil chemistry.
Identifiers: Prairie potholes.

Soil samples from a drainageway between two prairie potholes in North Dakota were analyzed to determine if and how migration of water through and upward from the saturated zone might influence the chemical composition of water flowing from the upper to the lower pond. Water in the unsaturated zone, that apparently achieves capillary equilibrium during the night, subsequently drains back down each day when equilibrium immediately above the water table is disrupted by transpiration. The salinity of water draining back to the water table is apparently increased as a result of transpiration. The proportion of sodium to calcium and magnesium in the water draining back to the water table is increased as a result of ion exchange. These processes produce an increase in both the salinity and proportion of sodium to calcium and magnesium of water arriving at the lower pond from the upper pond. (Knapp-USGS)

PRACTICAL IMPLICATIONS OF WATER REPELLENCY OF SOILS,
Arizona Univ., Tucson. Dept. of Agricultural Chemistry and Soils.
Hasan K. Qashu, and Daniel D. Evans.
Progressive Agriculture in Arizona, Vol 21, No 6, p 3-5, November-December 1969. 3 fig.

Descriptors: *Soil surfaces, *Organic matter, *Surfactants, *Wettability, Soil fungi, Irrigation, Water yield, Mudflows, Soil properties, Citrus fruit, Arizona, Deserts, Orchards.
Identifiers: *Water repellency, *Soil non-wettability, Peat moss.

Water repellency is a surface phenomenon induced by organic chemicals and/or organisms in the soil. Under natural conditions water repellency is caused by one or more of the following: (1) high content of organic matter in surface soil; (2) coating of soil particles by organic chemicals, and (3) high concentration of fungi mycellia. The two major areas of losses due to water repellency problems are probably home gardening and citrus orchards. This is quite often due to incorrect use of peat moss. Another problem area is watersheds that have been burned by wildfire. Water yield is increased, but so is erosion hazard. Mudflows often result. There are several surfactants available to combat water repellency in soils. The buyer should use the following criteria in selecting an appropriate surfactant: (1) efficiency of the chemical in combating water repellency; (2) effective period of the surfactant under local soil and climatic conditions; (3) degradability of the chemical and its residual effects on microbial ecology; and (4) economic and esthetic benefits derived from using the surfactant. More research is needed in the relationship of soil repellency to mechanisms of water transfer in soils. (Carr-Arizona)

SALT AND WATER MOVEMENT INTO SOLONETZIC SOILS,
Department of Agriculture, Lethbridge (Alberta). Research Station.
J. C. van Schaik, and R. R. Cairns.
Canadian Journal of Soil Science, Vol 49, No 2, p 205-210, June 1969.

Descriptors: *Alkaline soils, *Leaching, *Land reclamation, *Infiltration, *Saline water, Arid lands, Water loss, Sodium, Runoff, Evaporation, Ions, Cation adsorption, Capillary action, Penetration, Permeability, Soil horizons.
Identifiers: *Solonetzic soils, Alberta, Canada, Divalent cations.

Water infiltration into an alkaline soil (Duagh silt loam) was greatly increased with the aid of NH sub 4 super plus or divalent cations. An 0.1 N solution penetrated the soil 50 times faster than water. Greatest leaching efficiency occured when the soil was driest. But as long as there is a net annual downward movement of water in the soil, application of cations will cause the sodium to move downward in the soil profile. This treatment could improve penetration of the soil by rainwater and thus reduce runoff and evaporation loss. (Carr-Arizona)

A STUDY OF CERTAIN PHYSICAL PROPERTIES OF A VERTISOL IN THE GEZIRA AREA, REPUBLIC OF SUDAN,
Food and Agriculture Organization of the United Nations; and Ministry of Agriculture, Wad Medani (Sudan). Soil Survey Div.
A. Zein El Abedine, Glenn H. Robinson, and J. Tyego.
Soil Science, Vol 108, No 5, p 359-366, November 1969. 2 fig, 9 tab, 11 ref.

Descriptors: *Soil physical properties, *Soil types, *Moisture availability, *Hydraulic conductivity, Soil profiles, ARID LANDS, Semiarid climates, Percolation, Seepage, Retention, Particle size, Sodium, Pores, Clays, Density, Soil density probes.
Identifiers: *Vertisols, *Sudan, Exchangable sodium percent (ESP).

The soils of the Gezira area of the Sudanese Central Clay Plain have developed from basaltic parent materials in a semiarid to arid climate. These vertisols, similar to ones in Tanzania and Egypt, are notable for their high water retention. This ranges from 20 to 30% at 15 bars and from 45 to 65% at 0.1 bar. The available moisture levels are positively correlated with the exchangeable sodium percent and range from 45 to 65%, with an average of 21%. The soils have low hydraulic conductivities (from 5 cm/hour to 0.005 cm/hour), with one layer in the profile having relatively much lower conductivity. This appreciably checks the downward passage of water in the soil profile. (Carr - Arizona)

MOISTURE BALANCE IN SOILS OF THE EDMONTON AREA,
Alberta Univ., Edmonton. Soil Science Dept.
T. R. Verma, and J. A. Toogood.
Canadian Journal of Soil Science, Vol 49, p 403-407, October 1969. 3 tab, 10 ref.

Descriptors: *Semiarid climates, *Soil moisture, *Moisture deficit, *Soil types, Soil texture, Evapotranspiration, Storage capacity.
Identifiers: *Moisture balance, Available water capacity, Alberta, Canada.

Due to insufficient precipitation during the growing season, crops of the Canadian Prairies depend heavily on reserve soil moisture. The purpose of the study was to determine the moisture storage capacities of the 22 major soil types in the Edmonton area. The soils were sampled to a depth of 122 cm and found to have available water capacities ranging from 5 to 30 cm. Potential and actual evapotranspiration was estimated and from the data the moisture deficits were determined. Fine-textured soils showed deficits of 2-5.5 cm; medium-textured soils, 3.5-7 cm; and coarse-textured soils, 8-12 cm. Soils with high available water capacity did not show moisture deficits until July or later, but soils with low capacity showed a deficit from the very beginning of the growing season. A NUMERICAL STUDY OF LARGE-SCALE MOTIONS IN A TWO-LAYER RECTANGULAR BASIN,
Waterloo Univ. (Ontario). Dept. of Mechanical Engineering.
Kenneth B. Yuen.
Manuscript Report Series, No 14, Marine Sciences Branch, Department of Energy, Mines and Resources, Ottawa, 1969. 119 p, 58 fig, 6 tab, 59 ref.

Descriptors: *Great Lakes, *Model studies, *Water circulation, Mathematical models, Winds, Waves (Water), Currents (Water), Lakes, Frequency, Seiches.
Identifiers: Lake circulation.

Large-scale motion in the Great Lakes is predicted through the use of computer-oriented mathematical models. A one-layer one-dimensional model is constructed for Lake Huron. Spatial integration of the hydrodynamical equations by finite-difference techniques yields the frequencies of the lowest longitudinal free barotropic modes of Lake Huron. The power spectral analysis of water level records is carried out to verify these calculated frequencies. A numerical model is constructed for a two-layer rectangular basin of constant depth. The response of the basin under the influence of wind stress is studied. Six cases were investigated, in which the wind stress was impulsive, constant or periodic in time. The behavior of the basin is discussed in terms of theoretical forced and free motions. (Knapp-USGS)

REDUCTION OF ZOOPLANKTON STANDING STOCKS BY PREDACEOUS CYCLOPS BICUSPIDATUS THOMASI IN MARION LAKE, BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Dept. of Zoology; and British Columbia Univ., Vancouver. Inst. of Fisheries.
Donald J. McQueen.
Journal Fisheries Research Board of Canada, Vol 26, No 6, p 1605-1618, 1969. 8 fig, 1 tab, 12 ref.

Descriptors: *Predation, *Standing crop, *Copepods, Feeding rates, Rotifers, Zooplankton, Lakes.
Identifiers: *Marion Lake (British Columbia), Cyclops biscuspidatus, Cladocera, Canada.

Copepodids of stage IV and V and adults of Cyclops biscuspidatus are predators. Predaceous forms appeared in the plankton in April and May, peaked during July and decreased during August of both study years (1966 and 1967). Predaceous forms did not feed on seven forms of algae but did feed on six groups of animals: nauplii I-IV and copepodids I-III of C bicuspidatus, Diaptomus nauplii, Diaptomus copepodids, Cladocera, and rotifers. Laboratory feeding studies yielded high feeding rates of rotifers, Cyclops nauplii and Diaptomus nauplii, and low rates on cladocerans. Studies on predation rates under field conditions showed higher rates for mixtures of Cyclops and Diaptomus nauplii; lower rates for rotifers. Calculations of estimated number of prey eaten (C b nauplii) and surviving prey were 23.9 and 53.4 per liter, respectively; so that 31% of the nauplius production recruited during the summer could have been eaten, assuming feeding rates equal to those of laboratory studies. C b thomasi contributes significantly to mortality of diaptomid nauplii but not to copepodids. (Voightlander-Wisconsin)

PHYTOPLANKTON FROM SWEDISH LAKES. II. LAKE ASSJON 1961-1962,
Uppsala Univ. (Sweden). Inst. of Limnology.
Torbjorn Willen.
Oikos, Vol 20, No 1, p 67-77, 1969. 3 fig, 5 tab, 7 ref.

Descriptors: *Phytoplankton, *Lakes, Chemical analysis, Trophic level, Analysis, Cyanophyta, Chlorophyta, Chrysophyta, Diatoms, Euglenophyta, Pyrrophyta, Temperature, Oxygenation.
Identifiers: *Lake Assjon (Sweden), Peridinae groups, Physical analysis, Phytoplankton volume, Transparency.

This comprehensive qualitative and quantitative investigation of phytoplankton of Lake Assjon, Sweden, embraced an appraisal of about 100 taxonomic groups, including the predominant Chrysophyceae. The study was supplemented by determination of temperature, transparency, pH values, oxygenation, different forms of nitrogen, bases, dissolved and total phosphates, chlorides, sulfates, and carbonic acid. The changes in the volume of phytoplankton of different groups were recorded at monthly or shorter intervals from May 1961 till July 1962. The results of the study were compared with results obtained for Lake Vattern, Lake Sodra Vixen, and several others. The total plankton volume in the studied lakes is usually below five hundred million cubic micron/liter and seldom exceeds one billion cubic micron/liter. (Wilde-Wisconsin)

RELATIONSHIP BETWEEN BACTERIA, NUTRIENTS AND RAINFALL IN SELECTED BODIES OF FRESH WATER,
Florida Inst. of Tech., Melbourne. Univ. Center for Pollution Research.
David D. Woodbridge, and William R. Garrett.
Bulletin of Environmental Contamination and Toxicology, Vol 4, No 5, p 311-319, 1969. 5 fig.

Descriptors: *Bacteria, *Nutrients, *Rainfall, *Fresh water, Lakes, Pollutants, Sampling, Temperature, Dissolved oxygen, Nitrates, Phosphates, Coliforms, Runoff, Chemical properties, Recreation facilities.
Identifiers: Artificial lakes, St Johns River (Fla).

The pollution problem of small, man-made, lakes is increasing. They may act as accumulation points for nutrient material and bacteriological and chemical pollutants. St Johns River, Florida, a natural drainage for a large watershed, was selected as control for this study. Selection of two small lakes was based upon conditions existing in adjacent land areas. One, located in a wooded area, about 1/4 mile from the nearest dwelling; the second, encompassed by a housing development and by business establishments. Canals flow through the housing development into the lake. Analyses were made for dissolved oxygen, nitrate nitrogen, ortho phosphate, and bacteria. Results indicate that relationship between dissolved nutrients such as phosphate and nitrate and indicator bacteria (total coliform) are not simple or direct. Variability in data with time and different bodies of water raises doubts regarding the direct relationship between chemical and bacterial pollutants. Sharp increases in total coliform occurred in both lakes unrelated to rainfall. Total coliform in St Johns River correlate much closer to rainfall; even there several sharp increases in total coliform count occurred not obviously related to rainfall increase. (Jones-Wisconsin)

WHAT'S KILLING OUR LAKES,
Minnesota Univ., Minneapolis. Dept. Soil Science.
Lowell D. Hanson, and William E. Fenster.
Crops and Soils, Vol 22, p 13-15, 1969.

Descriptors: *Lakes, Streams, Fish, Land, Ecosystems, Eutrophication, Oligotrophy, Sewage, Algae, Scum, Weeds, Nutrients, Septic tanks, Effluents, Swamps, Forest soils, Minnesota, Wisconsin, Michigan, Phosphorus, Agricultural watersheds, Organic matter, Sediments, Fertilizers, Water pollution, Snow, Runoff, Drainage water, Grasslands, Soil erosion, Groundwater, Potholes.
Identifiers: *Killing, Animal manures, Lake Minnetonka (Minn), Soil minerals, Plant residues, Morris (Minn), Soil percolation.

Phosphorus sources from agricultural watersheds are soil minerals and organic matter; fertilizers, manures, and plant residues; sewage and sediment. If soil reacts with phosphorus-containing materials, seeping water will be stripped of phosphorus. Snow-melt carries higher amounts of phosphorus than runoff waters during other seasons. Septic tank waste water does not always evaporate as expected and seeps into groundwater and lakes. Bottom sediments serve as a 'phosphorus sink' reducing the explosive biological effects of phosphorus in water. Solution of environmental problems may involve extensive land-forming operations to force soil filtration of runoff water. Immediate improvements can be effected by not spreading manure on sloping frozen land, diverting feedlot and grain storage runoff into seepage areas, and storing manure in areas where runoff is not a problem; large feed lots should be located on level, fine textured soils rather than shoreline slopes of a stream or lake. Location decisions in agriculture will increasingly be guided by pollution control agency regulations and zoning restrictions. Land use planning has long range consequences. Cooperation of soil scientists, agricultural engineers, and farmers' innovative talents will result in quicker solutions. (Jones-Wisconsin)

THE UPTAKE OF ORGANIC SOLUTES IN LAKE WATER,
Uppsala Univ. (Sweden). Inst. of Limnology.
Richard T. Wright, and John E. Hobbie.
Limnology and Oceanography, Vol 10, No 1, p 22-28, Jan 1965. 3 fig, 3 tab, 15 ref.

Descriptors: *Lakes, *Organic matter, *Physiological ecology, Radioactivity techniques, Analytical techniques, Water pollution effects, Phytoplankton, Diffusion, Algae, Bacteria, Eutrophication, Glucose, Carbon radioisotopes, Dinoflagellates, Bioassay, Bioindicators.
Identifiers: *Heterotrophy, *Biological uptake, *Microbial ecology, Maximum uptake velocity, Active transport, Bacterial populations, Algal populations, Heterotrophic potential, Relative heterotrophic potential, Sweden, Enzyme kinetics, Lineweaver-Burk equation, Michaelis kinetics, Flagellates, Lake Erken (Sweden), Acetate, Lake Norrviken (Sweden), Acetate bacteria, Glucose bacteria, Chlamydomonads.

Methods exist for estimating, with radiocarbon (C-14) labelled organic compounds, their assimilation by planktonic microbiota. Based on Lineweaver-Burk modification of Michaelis enzyme kinetics, a modification of those methods is described which gives better estimates of heterotrophic potential, particularly in cases where uptake is mediated via processes of active transport. The treatment yields a linear relationship such that a plot of the expression, (C) (u) (t)/c, versus A has a slope whose inverse estimates maximum uptake velocity (where: C- counts/minute from 1 microcurie C-14 in counting device; u- microcuries added to sample; t- incubation time (hours); c- counts/minute from filtered organisms; A- milligrams/liter of added substrate). Where uptake results from diffusion into cell with instantaneous metabolism of substrate, a diffusion constant can be defined from knowledge of uptake velocities at two different substrate concentrations. Method was tested in two Swedish lakes subject to eutrophication. Over a wide range of substrates, estimates apparently show existence of two uptake mechanisms: a transport system, saturated at low substrate concentrations, and a diffusion process whose velocity increases steadily with increasing substrate. Evidence suggests that bacterial populations are responsible for 'transport-type' phenomena, and algal populations, for uptake by diffusion. (Eichhorn-Wisconsin)

NITROGEN METABOLISM IN LAKES. III. TRACER STUDIES OF THE ASSIMILATION OF INORGANIC NITROGEN SOURCES,
Pittsburgh Univ., Pa. Dept. of Biological Sciences.
Vera A. Dugdale, and Richard C. Dugdale.
Limnology and Oceanography, Vol 10, p 53-57, 1965. 4 fig, 8 ref.

Descriptors: *Lakes, *Nitrogen cycle, *Metabolism, *Tracers, Stable isotopes, Nitrogen compounds, Cycling nutrients, Pennsylvania, Phytoplankton, Water chemistry, Spectrophotometry, Chlorophyll, Nitrogen fixation, Water pollution sources, Water pollution effects, Phosphates, Chlorophyta, Chrysophyta, Cyanophyta, Diatoms, Eutrophication, Analytical techniques, Ammonium compounds, Nitrates.
Identifiers: *Nitrogen (Inorganic), Nitrogen-15, Millipore filtration, Kjeldahl technique, Nitrogen (Nitrate), Nitrogen (Ammonia), Isotope ratios, Sanctuary Lake (Pa), Coleman nitrogen analyzer, Seasonal effects, Mass spectrometry, Chlorophyll a, Nitrogen (Molecular), Linesville Creek (Pa), Phosphorus (Phosphate), Ammonium sulfate, Potassium nitrate.

Introduction of ammonium sulfate and potassium nitrate labeled with heavy nitrogen (N-15) into lake water samples permitted measurement of uptake rates of these nitrogen (N) sources in Sanctuary Lake, Pennsylvania, during a summer. Isotope ratios (N-15/N-14) of particulates, filtered from samples after short incubation periods with labeled compounds, were determined by mass spectrometry. In addition, fixation rates of molecular N-15 in such samples were estimated by techniques previously described and utilized in limnological studies. Fixation rates were compared with concentrations of inorganic N found in surface waters of the lake. Extensive variations in uptake regime observed during the season were probably associated with seasonal changes in the phytoplankton community. In early summer, all three forms (ammonia-N, nitrate-N, molecular N) were taken up rapidly, whereas a second pulse of uptake in late summer consisted predominantly of assimilated molecular N. Availability of N compounds in ambient water apparently does not control uptake in Sanctuary Lake, since all forms were present throughout summer, ammonia-N being most abundant, with concentrations in the range 34-300 micrograms/liter. In natural situations, ammonia-N apparently does not suppress N fixation, but may enhance it. (Eichhorn-Wisconsin)

ASPECTS OF THE LIMNOLOGY OF AN ENDORHEIC AFRICAN LAKE (L CHILWA, MALAWI),
Malawi Univ., Limbe.
Brian Moss, and Joyce Moss.
Ecology, Vol 50, No 1, p 109-118, 1969. 3 fig, 7 tab, 35 ref.

Descriptors: *Lakes, *Rainfall, Salinity, Turbidity, Temperature, Phytoplankton, Algae, Diatoms, Nitrates, Phosphates, Fish, Fish harvest.
Identifiers: *Lake Chilwa (Africa), Lake dynamics, Dry lakes, Eu-phytoplankton, Epipelic algae, Endorheic lakes, Africa, Malawi, Arthrospira platensis, Nitzschia palea, Anomoeoneis sphaerophora, Oscillatoria.

Depending on rainfall distribution, Lake Chilwa, Nyassaland, is subject to wide variations in its water volume and length of shoreline. These alterations are accompanied by corresponding great changes in conductance, concentration of chemical constituents, turbidity, and other water properties. The chemical composition of the lake is further complicated by inflow of salt springs and occasional flooding of the marginal mud flats. In dry periods, plant life of the lake is largely limited to epipelic algae; eu-phytoplankton is present only during a few weeks of the year. At times of high water level, the lake is nearly free from nitrates and inorganic phosphates. Regardless of this, large population of digestible diatoms persists on the sediment surface and fish production is high; in 1964 it was expressed in the annual catch of nearly 10,000 metric tons of merchantable fish. Since 1965 increase in salinity, turbidity, and temperature reduced the fish harvest to almost zero. (Wilde-Wisconsin)

A STUDY OF THE PROFUNDAL BOTTOM FAUNA OF LAKE WASHINGTON,
Washington Univ., Seattle. Dept. of Zoology.
Rudolph N. Thut.
Ecological Monographs, Vol 39, No 1, p 79-110, 1969. 27 fig, 5 tab, 34 ref.

Descriptors: *Benthic fauna, Nitrogen, Phosphorus, Phytoplankton, Diatoms, Zooplankton, Dinoflagellates, Algae, Dissolved oxygen, Hypolimnion, Epilimnion, Lake Erie, Insects, Diptera, Crustacea, Molluscs, Oligochaetes, Gastropods.
Identifiers: *Lake Washington (Wash), Macrofauna, Gyttja, Oscillatoria rubescens, Zurichsee, Filamentous algae, Filamentous blue-green algae, Ocular micrometer, Sucrose-flotation technique, Metalimnion, Bathythermograph, Arthropoda, Chironomidae, Aquatic Oligochaetes.

A review of the macrofauna in the profundal zone of Lake Washington between September 1963 and September 1964 and discussion. Although sewage diversion began in 1963, phosphate and oxygen values indicated the lake was still in the eutrophic phase. Ten stations were chosen at 5-meter depth intervals from 10 to 55 meters and sampled approximately monthly with an Ekman dredge. 24 species were recognized from the profundal zone, each presented separately, with the exception of Oligochacta species, along with their depth and population dynamics throughout the year. The Chironomidae were most numerous of bottom fauna constituents (about 45% of the total). 13 species were found during the study, including predators, deposit-feeders, and filter-feeders. Larvae were most common at the shallow-water stations and became progressively diminished with increase in depth. The Oligochacta comprised about 1/2 of the total number and 1/3 of the total biomass of the profundal fauna. Four species were identified. The Oligochacta were found in the greatest numbers and biomass at the greatest depth sampled; their abundance progressively declined with decrease in depth. Amphipoda and Sphaeridae were present but in smaller numbers. (Haskins-Wisconsin)

STUDY OF BACTERIA ASSOCIATED WITH MARINE ALGAE IN CULTURE. I. PRELIMINARY DETERMINATION OF SPECIES (FRENCH),
Station Marine d'Endoume, Marseille (France).
B. R. Berland, M. G. Bianchi, and S. Y. Maestrini.
Marine Biology, Vol 2, No 4, p 350-355, 1969. 3 tab, 12 ref.

Descriptors: *Bacteria, *Marine algae, *Cultures, Pseudomonas, Metabolism, Kinetics, Nitrogen compounds.
Identifiers: Species determination, Taxonomy, Flavobacterium, Achromobacter, Gulf of Marseilles, Asterionella japonica, Chaetoceros launderi, Lauderia borealis, Leptocylindrus danicus, Phaeodactylum tricornutum, Stichochrysis immobilis, Vibrio, Morphology, Cultural characteristics, Termary compounds, Macromolecules, Antibiotics, Agarbacterium, Xanthomonas, Micrococcus, Staphylococcus.

Bacteria strains have been isolated from marine algae cultures and assigned tentative genera and species. Observations and tests were conducted using Bergey's manual and specific papers on marine bacteria as taxonomic keys. The genera Pseudomonas, Flavobacterium, and Achromobacter appear most important, based on the number of species. This does not imply that they actually dominate in number of germs and in metabolic importance. A later study will permit determination of the precise nature and division of species which accompany an alga in culture and subsequently the same alga in its natural environment. It may be necessary to use some culture medium more definitive and less plethoric, the medium currently used being too rich in organic matter and not corresponding to conditions of the natural medium of the organisms; the literature shows that their nutritional needs are very simple. The study is undertaken to determine precisely their metabolic needs and how these are satisfied in a culture of algae. (Jones-Wisconsin)

COMPETITION BETWEEN PLANKTONIC BACTERIA AND ALGAE FOR ORGANIC SOLUTES,
Uppsala Univ. (Sweden). Inst. of Limnology.
John E. Hobbie, and Richard T. Wright.
Memorie dell'Instituto Italiano di Idrobiologia, Suppl 18, p 175-185, 1965. 4 fig, 1 tab, 5 ref.

Descriptors: *Competition, *Phytoplankton, *Aquatic bacteria, *Algae, Organic matter, Lakes, Diffusion, Carbon radioisotopes, Chlamydomonas, Bioassays, Water pollution effects, Analytical techniques.
Identifiers: *Organic solutes, *Heterotrophy, Microbial ecology, Sweden, Lake Erken (Sweden), Active transport, Carbon-14, Enzyme kinetics, Glucose, Mechaelis-Menten equation, Acetate, Glycollic acid.

Sophisticated investigative techniques, in addition to the traditional methods of direct counts and enrichment cultures, are required for better understanding of roles of microorganisms in the dynamics of lacustrine metabolism. A problem of current interest is the identification of organic solutes utilized by heterotrophic bacteria and algae, and estimation of their concentrations and uptake rates. Data on assimilation of radiocarbon-labeled organic substrates can be analyzed on bases of theories of diffusion and enzyme kinetics. Such methods are illustrated with data from studies on model cultures (Chlamydomonas and planktonic bacteria) and samples from Lake Erken (Sweden). Measurements of velocity uptake of radioisotope over a range of substrate concentrations reveal two mechanisms: an active transport system, attributable to bacteria, and another system in algae which follows diffusion kinetics. The latter is effective at substrate concentrations above 500 micrograms/liter. In natural waters, bacteria effectively reduce acetate and glucose concentrations below 20 micrograms/liter, apparently effecting drastic limitation of algal heterotrophy. In nature, other compounds are available to algae and higher temperature may increase uptake rates, so that algal heterotrophy is not necessarily precluded. (Eichhorn-Wisconsin)

A NEW METHOD FOR THE STUDY OF BACTERIA IN LAKES: DESCRIPTION AND RESULTS,
North Carolina State Univ., Raleigh. Dept. of Zoology; and Gordon Coll., Wenham, Mass.
John E. Hobbie, and Richard T. Wright.
Mitteilungen Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Vol 14, p 64-71, 1968. 5 fig, 10 ref.

Descriptors: *Lakes, *Bacteria, *Analytical techniques, Water pollution effects, Algae, Ecosystems, Physiological ecology, Aquatic bacteria, Carbon radioisotopes, Enzymes, Kinetics, Photosynthesis, Organic matter, Organic compounds, Metabolism, Bioindicators, Bioassays.
Identifiers: *Heterotrophy, Autotrophy, Carbon-14, Radiocarbon uptake techniques, Glucose, Michaelis-Menten equation, Sweden, Lake Erken (Sweden), Lineweaver-Burk equation, Maximum uptake velocity, Michaelis constant, Lake Norrviken (Sweden), Lake Ekoln (Sweden), Lake Lotsjon (Sweden), Permeases, Chamydomonads, Lappland (Sweden), Acetate, Turnover times.

Although bacteria are important in lacustrine metabolism, details of their population dynamics--including generation times and turnover rates--are poorly understood. Radiocarbon-labeled organic compounds have been used previously to determine heterotrophic potential of natural waters, but concentrations of substrate added have been sufficiently large as to make interpretation of resultant data ambiguous. Based upon theoretical treatment adapted from Lineweaver-Burk modification of Michaelis-Menten enzyme kinetics, and on additions of very low concentrations of labeled organic substrates, a new method for study of bacterial assimilation is described. That derivation yields relationship, $t/f = (K + S)/V) + A/V$. Here, t is incubation time (hours); f, percentage uptake of isotope by organisms; K, constant (similar to Michaelis constant); s, substrate concentration in nature; A, added substrate concentration; V, maximum velocity. Plot of t/f versus A usually results in linear relationship from which can be estimated maximum uptake velocity (V), turnover time, and approximate naturally occurring substrate concentration. Method is illustrated with data from a series of Swedish lakes. During a single year, V may vary by 2 orders of magnitude within one lake; by 4, between lakes. V is also a very sensitive indicator of pollution. (Eichhorn-Wisconsin)

ANNUAL AUTOTROPHIC PRODUCTION OF PHYTOPLANKTON IN LAKE BAIKAL,
K. K. Votintsev, and G. I. Popovskaya.
Translated from Russian. Original p 205-208. Doklady Akademii Nauk SSSR, Vol 176, No 1, p 634-637, 1967. 3 fig, 1 tab, 13 ref.

Descriptors: *Phytoplankton, *Lakes, Organic matter, Seasonal, Algae, Primary productivity, Harvesting of algae, Biomass.
Identifiers: Seasonal distribution, Lake Baikal, Photosynthetic layer, Melosira baicalensis, Gymnodinium baicalense, Cyclotella minuta.

This pioneering survey of organic matter production in Lake Baikal disclosed a wide place-and-time variation in the biomass of phytoplankton, represented largely by Melosira baicalensis,

Cyclotella minuta, and Gymnodinium baicalense. According to preliminary estimates, the lake has an annual productivity of 157 million tons (wet weight) of harvestable algae, and 136 million tons of non-harvestable algae. The study of primary productivity by the 'flask' method, using oxygen, was confined to the upper 25 meters of the photosynthetic layer. The mean annual biomass per surface square meter of this layer approached 7 grams. The ratio of the average annual primary production to the mean annual index of phytoplankton biomass for the entire lake was equal to 464. Previous studies have shown that values for gross photosynthesis are close to those permitting effective productivity of algae. Information on food requirements of main representatives of zooplankton of Lake Baikal th as far is not available. (Wilde-Wisconsin)

SEASONAL CHANGES IN THE LIMNOLOGY OF SOME MEROMICTIC LAKES IN SOUTHERN BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Inst. of Fisheries.
T. G. Northcote, and T. G. Halsey.
Journal Fisheries Research Board of Canada, Vol 26, No 7, p 1763-1787, 1969. 9 fig, 7 tab, 32 ref.

Descriptors: *Seasonal, *Limnology, *Meromixis, *Lakes, Dissolved solids, Density, Chemical properties, Temperature, Ice, Profiles, Dissolved oxygen, Hydrogen ion concentration, Alkalinity, Physicochemical properties, Biological properties, Conductivity, Sulfur bacteria, Sampling, Frequency, Phytoplankton, Zooplankton, Benthos, Light penetration, Hydrogen sulfide, Surfaces, Copepods, Crustaceans, Standing crop, Depth, Rainbow trout, Dissolved solids, Lakes.
Identifiers: *British Columbia, Chemocline, Vertical, Plates, Morphometry, Geographic features, Bottom, Mixolimnion, Monimolimnion, Diatomus connexus, Ceriodaphnia lacustris, Brachionus plicatilis, Keratella, Campylodiscus, Oedoginium, Cladocerans, Transparency, Meromictic lakes.

Seasonal changes in physical, chemical, and biological features are described in four small British Columbia lakes showing different types and degrees of meromixis. A wide range exists in total dissolved solid content between lakes and within specific lakes (surface to near-bottom, in milligrams/liter): Yellow, surface 282, bottom 337; White, 6229-7918; Mahoney, 10,003-86,906; Lyons, 12,116-222,195, but no marked seasonal changes. Yellow Lake meromixis is probably maintained by morphometric features of the lake basin rather than strong chemocline; in the other lakes complete mixing is inhibited by chemical density gradients, those in Mahoney and Lyons being especially sharp. Summer, autumn, winter (under ice), and spring vertical profiles are presented for temperature, dissolved oxygen, pH, alkalinity, specific conductivity, and differences discussed. Lesser detailed physical-chemical characteristics are given. Purple sulphur bacteria occur in Lakes White, Mahoney and Lyons and in the latter two from discrete 'plates' detectable by high frequency echo sounding (confirmed by sampling). Seasonal changes in depth of bacterial plates are considered in relation to some physical and chemical parameters. Phytoplankton, zooplankton, and benthos communities are discussed, based on degree of meromixis shown by the lakes. (Jones-Wisconsin)

HETEROTROPHIC BACTERIA IN LAKE MALAREN AND LAKE HJALMAREN,
Uppsala Univ. (Sweden). Inst. of Limnology.
R. Fonden.
Oikos, Vol 20, No 3, p 344-372, 1969. 23 fig, 5 tab, 36 ref.

Descriptors: *Bacteria, Seasonal, Sampling, Coliforms, Depth, Surfaces, Ice, Chlorophyll, Phosphorus, Nitrogen, Zooplankton, Organic matter, Phytoplankton, Primary productivity, Chemical analysis, Conductivity, Temperature, Stratification, Population, Sewage, Industrial wastes, Oxygen, Hypolimnion, Epilimnion, Optical properties, Carbon radioisotopes, Meteorological data, Outlets, Detritus, Density, Daphnia, Grazing, Standing crop, Effluents, Filtration, Fluorescence, Eutrophication, Oligotrophy.
Identifiers: *Coliformic bacteria, *Heterotrophic, *Lake Malaren (Sweden), Lake Hjalmaren (Sweden), YPA-bacteria, Vertical distribution, Horizontal distribution, MPA-bacteria, Chromogens, Morphometric, Transparency, Metalimnion, Holomictic, Escherichia coli, Aerobacter aerogenes, Cyclops, Bosmina, Eudiaptomus, Excretion, Filter-feeding, Transported bacteria.

Vertical, horizontal and seasonal variations of YPA-bacteria in Lakes Malaren and Hjalmaren were investigated. Weekly samples were analyzed for coliformic, MPA- and YPA-bacteria. During summer stratification, highest numbers of YPA-bacteria occurred at 0.5 meters; decreasing at 5 meters and greater depths. No significant differences in vertical distribution of YPA-bacteria were detected in the hypolimnion. Highest bacterial densities were found near towns; lowest at lake centers. Positive correlation was found between UPA-bacterial numbers from surfaces and concentration of chlorophyll a, phosphorus, and nitrogen. Negative correlation was found between bacterial density and depth of water column. Bacteria was prolific in June in Lake Marlaren. During spring and autumn, sampling stations near river outflows showed high and maximal numbers of coliformic and MPA-bacteria in Ekoln Basin. In winter, numbers were low at most stations as were numbers of washed-in bacteria. During summer, density of UPA-bacteria were apparently influenced by filter feeding zooplankton and amount of available organic carbon. Bacterial maxima recorded during summer using a nutrient-poor yeast-extract peptone medium were not recorded on ordinary nutrient agar. Proportion of pigmented bacteria was greatest at the surface during summer, and lowest during winter. (Jones-Wisconsin)

Identifiers: *Glucose, *Acetate, *Heterotrophy, Microbial ecology, Carbon-14, Sweden, Lake Erken (Sweden), Active transport, Enzyme kinetics, Michaelis-Menten equation, Lineweaver-Burk equation, Sugars, Fatty acids, Bacterium EY-19, Uptake velocity, Pseudomonas, Bacterium ER-19, Gymodinium inversum, Utermohl technique, Radiocarbon uptake technique, Chlorophyll a, Michaelis constant, Maximum velocity, Transport constant, Turnover time, Lake Norrviken (Sweden), Lake Lotsjon (Sweden), Lake Ekoln (Sweden).

Kinetic analysis of phytoplankton uptake of radiocarbon-labeled organic solutes yields useful information about dynamics of microbial ecology. Tests over wide substrate ranges indicate existence of two uptake mechanisms. Data from differential filtration and experiments with model laboratory cultures of bacteria and algae differentiate between specific transport systems, effective at very low substrate concentrations, attributable to bacteria, and diffusion mechanisms, effective at greater substrate concentrations, operative in algae. Proper treatment of data yields estimates of following kinetic parameters which have ecological significance: maximum velocity of uptake by bacteria, giving information on sizes and functions of their populations; diffusion constant, relating to rate of solute uptake by algae; and turnover times of organic solutes in aquatic environments. Turnover times of glucose and acetate in eutrophic Lake Erken, Sweden, indicates that algal uptake never exceeds 10% of bacterial, although algal biomasses may greatly exceed bacterial. Two new bioassays can employ kinetics of bacterial uptake to measure naturally occurring concentrations of substrates. Acetate and glucose remain at relatively constant levels of 1-10 micrograms/liter in several aquatic habitats. It is postulated that bacteria effectively utilize substrate at these low levels, and thus, prevent heterotrophic growth of algae. (Eichhorn-Wisconsin)

PRIMARY PRODUCTION AND NUTRIENTS IN OGAC LAKE, A LANDLOCKED FIORD ON BAFFIN ISLAND,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
Ian A. McLaren.
Journal Fisheries Research Board of Canada, Vol 26, No 6, p 1561-1576, 1969. 9 fig, 1 tab, 6 ref.

Descriptors: *Primary productivity, *Zooplankton, *Fertilizers, Chlorophyll, Oxygen, Stratification, Fresh water, Analytical techniques, Analysis, Fjords, Nutrients.
Identifiers: *Holocline, Carbon-14, Baffin Island (Canada), Fertilizer trials, Ogac Lake (Canada).

This study was concerned with the effect of fertilization on primary production and zooplankton of Ogac Lake, Canada. To raise concentration of phosphorus and nitrate nitrogen, known amounts of potassium nitrate and diacid potassium phosphate were added to 3 meter-long and 1 meter-diameter polyethylene columns suspended in the middle of the lake between the anoxic and oxygenated layers. Analyses included determination of chlorophyll, phosphorus, nitrite, nitrate, and carbon-14 uptake. The effect of fertilization was expressed in fivefold increase in amount of chlorophyll and in sevenfold increase in primary production. This improvement took place regardless of the fact that some amount of fertilizers was lost by sinking in particulate form, an unavoidable result in highly stratified lakes. Zooplankton grazing was concentrated at the holocline and deep water and apparently had little influence on the production pattern of the lake. In summer, inflow of fresh water into the narrow zone of Ficus at 2-3 meters killed much of the fauna, thereby augmenting the supply of nutrients. (Wilde-Wisconsin)

FOOD OF LAKE TROUT IN LAKE TAHOE,
Nevada Fish and Game Dept., Reno; and California State Dept. of Fish and Game, Sacramento. Inland Fisheries Branch.
Ted C. Frantz, and Almo J. Cordone.

California Fish and Game, Vol 56, No 1, p 21-35, 1970. 8 tab, 30 ref.

Descriptors: *Fish, *Food habits, *Fish diets, *Lake trout, Sculpins, Fish food organisms, California, Nevada, Amphipoda, Crayfish, Daphnia, Insects, Larvae, Oligochaetes.
Identifiers: *Lake Tahoe (Calif), Cladocera, Ostracoda, Plecoptera, Tenipedae.

Stomachs of 1389 lake trout of five size groups were analyzed. Samples were obtained by creel census, gill-net and bottom trawl. Percentage of empty stomachs increased directly with fork length of fish. Fish under 5 inches utilized cladocerans and copepods (over 90% by weight and frequency of occurrence); tendipid larvae and pupae were of secondary importance. Fish (sculpin) became an important dietary component in fish 5 to 9.9 inches; cladocerans and tendipeds were of secondary importance and amphipods assumed importance. Fish and cladocerans remained important in fish 10 to 14.9 inches, fish other than sculpins and including small lake trout were ingested. Sculpins dominated diet of fish 15 to 19.9 inches; importance of cladocerans diminished while importance of crayfish increased. Fish over 19.9 inches relied almost entirely on fish, primarily suckers. Percentage of stomachs containing food was highest in spring and summer, lowest in winter and autumn for all size groups; mean weight of food per stomach was also highest in spring and summer. Fish were utilized most in spring months, least in summer. Tabular data include seasonal stomach analyses by size group of lake trout. (Voigtlander-Wisconsin)

THE DEVELOPMENTAL HISTORY OF BLELHAM TARN (ENGLAND) AS SHOWN BY ANIMAL MICROFOSSILS, WITH SPECIAL REFERENCE TO THE CLADOCERA,
Indiana Univ., Bloomington. Dept. of Zoology.
Rodney V. Harmsworth.
Ecological Monographs, Vol 38, No 2, p 223-241, 1968. 9 fig, 4 tab, 91 ref.

Descriptors: *History, *Animals, *Microorganisms, Midges, Sediments, Pollen, Paleolimnology, Bogs, Peat, Glaciers, Organic matter, Temperature, Indicators, Cyanophyta, Oligotrophy, Eutrophication, Zooplankton, Phytoplankton, Chemical analysis, Daphnia, Stratigraphy, Mud, Clays, Littoral, Arctic, Sub-arctic, Temperate, Humic acids, Rotifers, Copepods.
Identifiers: *Microfossils, *Cladocera, *Blelham Tarn (England), Neorhabdocoeles, Bythotrephes, Lake Windermere (England), Chydoridae, Sida, Bosminidae, Bosmina coregoni, Bosmina longirostris, Tanytarsus, Sergentia, Chironomus, Polyphemus, Crooked Lake (Ind), Madison (Wis), Egg-capsules, Ceriodaphnia, Sphagnum, Chydorus sphaericus, Chydorus ovalis, Leptodora, Acroperus harpae, Esthwaite Water (England), Tuberculate Cladocera.

Two cores were taken from Blelham Tarn, 'A,' from a peat bog containing both Lateand Post-glacial sediments, and, 'B,' from deep water containing only Post-glacial sediments. The Cladocera were analyzed qualitatively and quantitatively. Nine species of non-chydorid Cladocera and 24 species of Chydoridae were found. In 'A' two marked periods of abundance occurred in the Allerod and in the Preboreal, with few remains in the Older and Younger Dryas. Periods of abundance coincided with maxima in organic sediment content, and higher temperatures as deduced from stratigraphic distribution of chydorids. Few remains were found in upper peat section of 'A,' but distribution gave evidence of periodic lake level changes. 'B' showed marked changes in abundance of planktonic community, presumably correlated with changes occurring in the peat section of 'A.' Typological succession was followed in the Post-glacial by means of indicator organisms, especially Bosmina coregoni, which gave way to B longirostris in Sub-atlantic period. Midges were analyzed in 'B' and replacement of a predominantly Tanytarsus-Sergentia community by Chironomus occurred shortly before the change-over in the Bosmina species. The neorhabdocoeles, egg-capsules well preserved in lake sediments, are described. Their stratigraphy showed no obvious relationship to other lake events. (Jones-Wisconsin)

Journal Fisheries Research Board of Canada, Vol 26, No 5, p 1363-1368, 1969. 2 tab, 9 ref.

Descriptors: *Primary productivity, *Fish, *Salmon, *Growth rates, *Food chains, Radioactivity technique, Dissolved solids.
Identifiers: Owikeno Lake (British Columbia), British Columbia, Canada, Sockeye salmon, Chlorophyll a, Fish production, Lake Chignik (Alaska), Lake Karluk (Alaska), Lake Igushik (Alaska), Black Lake (Alaska), Babine Lake (British Columbia).

Primary production was measured at two stations on two dates in Owikeno Lake, British Columbia. Mean carbon assimilated per 4 hours was 11 milligrams/square meter (range 2.57 to 30.23) and 1.8 milligrams/cubic meter (range 0.62 to 3.33). Mean chlorophyll a was 0.9 milligrams/cubic meter (range 0.27 to 1.34). Measurements of assimilated carbon were higher in June, chlorophyll a was greater in September. Owikeno has a low primary production rate compared with other major sockeye-producing lakes; probable factors involved include high turbidity and low total dissolved solids. Significance of primary productivity measurements relative to rearing capacity of lake for juvenile sockeye is unknown, but slow growth rate of juveniles may be due to retarded rate of energy transfer through the phytoplankton-zooplankton-sockeye food chain. Tabular data include all measurements in Owikeno Lake and comparison of salmon returns and productivity measurements for six lakes, including Owikeno. (Voigtlander-Wisconsin)

THE EFFECT OF IMPOUNDMENTS ON NATURAL WATERS (IN GERMAN),
Akademiya Nauk SSSR, Leningrad (USSR).
W. I. Shadin.
Verh. Internat. Verein, Limnol., Vol. IV, p 792-805, July 1961.

Descriptors: *Lakes, *Reservoirs, Zooplankton, Phytoplankton, Temperature, *Epilimnion, *Hypolimnion, Algae, Fungi, Bacteria, Fish, Limnology, Hydrologic aspects, Aquatic environment, Water properties, Biological properties, Ecology, Stratification.
Identifiers: Water quality properties.

The building of impoundment qualitatively changes the biological and ecological system of water. A survey of response of water quality to the building of reservoirs and review of water quality properties in lakes and reservoirs in different geologic and climatic conditions is presented in the paper. The water quality and biological system of water in impoundment is dependent on many factors, such as hydrologic regime, climatic and regional conditions, purpose of reservoir, etc. The temperature distribution influences the detention (through-flow) time and formation of density layers with different water quality parameters. The chemical regime is mainly dependent on sludge formation. The amount of bacteria in water has two maximums during a year. The formation of zooplankton and phytoplankton is further discussed. The paper was presented as a leading lecture at XIV-th International Limnological Conference in 1961. (Novotny-Vanderbilt)

PREDICTION OF THERMAL ENERGY DISTRIBUTION IN DEEP RESERVOIRS,
Water Resources Engineers, Inc., Walnut Creek, Calif.
G. T. Orlob, and L. G. Selna.
Proceedings of the Annual Sanitary and Water Resources Engineering Conference, Technical Report No. 6, in Sanitary and Water Resources Engineering, Vanderbilt University, 1967. p 64-77, 1967. 8 fig, 3 ref.

Descriptors: *Thermal stratification, *Mathematical models, *Reservoirs, *Temperature, Thermocline, Heat transfer, Energy transfer, Digital computers, Diffusion, Epilimnion, Hypolimnion, Impoundments, Thermal conductivity, Tennessee Valley Authority Project, California, Lakes.

A mathematical model for simulation of thermal energy distribution (temperature) in impoundments is presented. Assumptions are made and justified concerning the one-dimensional approach to structuring the model, the nature of the heat transfer (eddy diffusion) coefficient, and selected boundary conditions. An example, derivation of the transfer coefficient A (z,t) from actual field data is presented and interpreted to show the limiting nature of the thermocline in energy transfer in the vertical and the nature of mixing in the epilimnion and hypolimnion. Results of a hypothetical test case for a reservoir receiving a natural runoff, including snow melt, are given and qualitatively compared to observed behavior of actual reservoirs. TEMPERATURE CONTROL OF RESERVOIR RELEASES INTO NOLIN AND BARREN TAILWATERS,
Department of Fish and Wildlife Resources, Ky.
J. P. Carter.
Project, Department of Fish and Wildlife Resources, Kentucky, 1968. 36 p, 14 tab., 3 fig., 8 ref.

Descriptors: *Temperature, *Reservoirs, *Fishing, Electro-fishing, Fish harvest, *Temperature control, Thermal stratification, Thermal properties, Reservoir operation, Fish management, Limnology, Kentucky.
Identifiers: Kentucky reservoirs.

Investigations were conducted on Nolin Reservoir tailwater and Barren Reservoir tailwater to evaluate success in controlling tailwater temperatures through the utilization of multi-level releases, and to determine the fish population composition, and to measure fishing intensity, creel composition and fishing success on the tailwater. Gate-level releases were required during the temperature control period to control reservoir water levels and this contributed to lower tailwater temperatures during the months of April, May, June, and July. Electrofishing studies revealed that substantial numbers of

fishes emigrated from the reservoir into the tailwaters. Species dominance in the sections immediately below the dams fluctuated with the reservoir regulation period. During the seasonal pool period in the summer, game fishes and panfishes were most abundant; after drawdown in the fall threadfin shad was the dominant species; and prior to the seasonal pool period in early spring carp was the dominant species. The catch rate fluctuated from a low of 0.33 fish per hour at Barren to a high of 1.47 fish per hour at Nolin. The estimated annual harvest ranged from 3,486 fishes at Nolin to 15,852 fishes at Barren. At Nolin the creel was numerically dominated by crappies the third year of impoundment and sunfishes the fourth year. At Barren the creel was numerically dominated by suckers, carp, and crappies, respectively, during the first three years of impoundment. (Novotny-Vanderbilt)

NATURAL PROCESSES AND THEIR INFLUENCE ON RESERVOIR WATER QUALITY,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
S. G. Walesh.
Journal American Water Works Association, Vol. 59, No. 1, p. 63-79, January 1967. 1 fig., 2 tab., 22 ref.

Descriptors: *Reservoir, *Thermal stratification, Water quality, Temperature, Dissolved oxygen, *Iron, *Manganese, Hypolimnion, Silica, Diatoms, Alkalinity, Oxygen, Water chemistry, Water quality control.
Identifiers: Lock Raven Reservoir, Gunpowder Falls River, Prettyboy Reservoir, Specific conductance.

A study was made to provide a representative description of the physical, chemical, and biological aspects of Loch Raven Reservoir, and to illustrate how natural phenomena may affect the quality of water in and from water supply impoundments. Results and discussions are presented on temperature, dissolved oxygen, silica, diatoms, iron, manganese, specific conductance, and alkalinity in the reservoir. The conclusions are that the effects of thermal stratification, hypolimnetic dissolved oxygen depletion, etc., are the result of processes in the sediment. The two most significant substances with nuisance potential which went into solution when hypolimnetic oxygen depletion occurred were iron and manganese. Draft gate operation can be a critical factor in determining the quality of water received from the reservoir. (Rietveld-Vanderbilt)

MATHEMATICAL SIMULATION OF THERMAL STRATIFICATION IN DEEP IMPOUNDMENTS,
Water Resources Engineers, Inc., Walnut Creek, Calif.
G. T. Orlob, and L. G. Selna.
Proceedings, ASCE Specialty Conf. on Current Research into the Effects of Reservoirs on Water Quality, Jan. 1968, Technical Report No. 17 in Environmental and Water Resources Engineering, Vanderbilt University, Nashville, Tenn, 33 p. 10 fig., 20 ref.

Descriptors: *Mathematical models, *Temperature, *Impoundments, Lakes, Reservoirs, Epilimnion, Hypolimnion, Thermocline, *Thermal stratification, Diffusion, Mixing, Heat balance, Energy transfer, Digital computers, Heat transfer, Temperature gradient, Thermal properties, Thermal conductivity, Inflow.

A theory and practical experience with mathematical modeling of the thermal behavior of water in reservoirs and lakes is presented in the paper. As to diffusion processes occurring in heat mixing, it was stated that (1) Effective mixing in the epilimnion is greatest near the surface but declines rapidly with depth as the thermocline is approached. (2) The effective diffusion coefficient is minimal at or very near the position of the thermocline. (3) In the hypolimnion the effective diffusion coefficient increases with depth in a erratic manner, reaching a maximum roughly equivalent to that of the epilimnion at about mid-depth, thereafter decreasing as the bottom is approached. Model was verified using the real data and conclusions are the following: (1) The transfer of energy into deep stratified impoundments is accomplished by advection, direct solar insolation, convective mixing associated with cooling at the surface, and effective diffusion. (2) The transfer of energy from the epilimnion to the hypolimnion by diffusion is limited at the thermocline. (3) A one-dimensional mathematical representation of energy transfer processes is satisfactory for deep reservoirs. (4) Reservoir thermal behavior over annual or diurnal cycles can be simulated with a mathematical model using as input information continuous records of hydrologic, meteorologic, and climatologic conditions of the system. FIELD EXPERIMENTS ON THE EFFECT OF LIGHT CONDITIONS IN PHRAGMITES STANDS ON THE PRODUCTION OF LITTORAL ALGAE,
Warsaw Univ. (Poland). Dept. of Hydrobiology; and Ceskoslovenska Akademie Ved, Prague. Hydrobiological Station.
E. Pieczynska, and M. Straskraba.
Bulletin de l'Academie Polonaise des Sciences (Serie des Sciences Biologiques), Vol 17, No 1, p 43-46, 1969. 2 fig, 4 ref.

Descriptors: *Radiation, *Analytical techniques, *Photosynthesis, *Algae, Plankton, Biomass, Littoral, Periphyton, Light intensity, Chlorophyll, Oxygen, Phosphorus, Nitrogen.
Identifiers: *Phragmites, Cladophora, Spirogyra, Smyslov Pond (Czechoslovakia), Southern Bohemia, Macrophytes.

Photosynthesis of planktonic and periphytic algae was determined in parts of Smyslov Pond, southern Bohemia, occupied by reeds, and in adjacent area free from macrophytes. Light and dark oxygen bottles with freshly collected Cladophora and Spirogyra spp, volumeter, Kjeldahl and Winkler methods served as analytical tools. Intensity of light and daily radiation were recorded by a photocell and a solarimeter. The chlorophyll content was also determined at four wavelengths by a spectrophotometer. The production of algae was considerably higher in open water than in portions of the pond shaded by reeds. The relationship under conditions of observation and on a per day basis was expressed by the equation: milligram oxygen/milligram nitrogen = 0.949 log gram caloric/square centimeter - 1.208. (Wilde-Wisconsin)

TREATMENT OF ALGAE AND WEEDS IN LAKES AT MADISON,
Health Dept., Madison, Wis. Lab.
Bernard P. Domogalla.
Engineering News-Record, Vol 97, No 24, p 950-954, 1926. 8 fig, 3 tab.

Descriptors: *Copper sulfate, *Eutrophication, *Algae, *Aquatic weeds, Lakes, Algicides, Aquatic weed control, Mechanical control, Water pollution control, Chemcontrol, Arsenic compounds, Nitrogen, Phosphorus.
Identifiers: *Madison lakes (Wis), *Aquatic weed cutting, *Weed extracting steel cables, Algal succession, Anabaena, Cladophora, Pediastrum, Hydrodictyon, Potamogeton, Ranunculus.

Field and laboratory investigations of highly eutrophic lakes in the vicinity of Madison yielded several conclusions. The copper sulfate dragging method proved to be most effective for suppression of bottom-anchored algae on wind exposed areas. The surface algae and those inhabiting shallow waters were best controlled by spraying with copper sulfate. Weeds in open water were eliminated by weed-cutting machines. Stems and roots of weeds in shallow waters and near shore lines were extracted by steel cables with clips and swivels. Several species of water weeds were eradicated by sodium arsenite. The study disclosed a seasonal succession of aquatic plants and a pronounced relationship between eradication treatments and biological fixation of available forms of nitrogen and phosphorus. THE BOTTOM FAUNA OF LAKE VATTERN, CENTRAL SWEDEN, AND SOME EFFECTS OF EUTROPHICATION,
Ulf Grimas.
Institute Freshwater Research Reports, Drottningholm, Sweden, Vol 49, p 49-62, 1969. 3 fig, 3 tab, 18 ref.

Descriptors: *Lakes, *Benthic fauna, *Eutrophication, *Biomass, Productivity, Phosphorus, Nitrogen, Organic matter, Water pollution effects.
Identifiers: *Lake Vattern (Sweden), Sweden, Oligotrophic lakes, Pontoporeia affinis.

Lake Vattern, a large oligotrophic lake, is being subjected to inputs of phosphorus and nitrogen (resulting from human activities) at rates of 200 and 400 metric tons/year, respectively. Phosphorus input has increased approximately 300% during the last 50 years. Input of nitrogen from all sources, including precipitation, is about 1900 metric tons/year; organic matter, excluding industry and communities, is estimated at 50,000 metric tons/year. Biomass of benthic organisms ranges from 0.6 to 9.6 grams/square meter, dependent on depth and section of lake. Greatest numbers and biomass are found in depth ranges 0-20 meters (littoral) and 40-60 meters. Large crustaceans and oligochaetes dominate profundal (40-100 meter-depth) region; chironomids (Orthocladiinae, Tanytarsini, Chironomini) dominate littoral region. Highest average biomass (4-6 grams/square meter) is found in littoral region at southern end of the lake, where phosphorus and organic-matter input is greatest. Comparisons with data of 1911-1914 show increases in filtering animals (sphaeriids) and large crustaceans; these are considered indicative of an early phase of eutrophication. (Voigtlander-Wisconsin)

THE ECOLOGICAL DECLINE OF LAKE ERIE,
New York State Coll. of Agriculture, Ithaca.
Dean F. Arnold.
New York Fish and Game Journal, Vol 16, No 1, p 27-45, 1969. 5 fig, 69 ref.

Descriptors: *Lake Erie, *Eutrophication, *Water pollution effects, *Water pollution sources, Domestic wastes, Dissolved oxygen, Zooplankton, Benthic fauna, Fisheries, Walleye.
Identifiers: *Cultural eutrophication, Maumee River (Mich), Detroit River (Mich), Blue pike, Coregonids, Sturgeon.

Lake Erie is perhaps the best-documented example of a large lake which is deteriorating rapidly in several aspects, including eutrophy. The shallow Western Basin is exposed to high sediment loads, contributed largely by farmland erosion transported by the Maumee River. Human activities, including construction of jetties and erosion-control structures have increased total shore erosion and silt load. Effects of domestic and industrial pollution are most noticeable in the Western Basin. All chemical constituents except silicate and iron have increased from about 16 to 300% since 1906. Oxygen depletion is most notable in the deeper Central Basin. Average quantity of phytoplankton has increased threefold; shifts in species composition have been noted. Blue-green algae have become a dominant form; attached and floating algae have increased. Cladoceran zooplankton have increased as have characteristically eutrophic species of copepods. Mayfly naiads (Hexagenia) have decreased markedly while Oligochaetes, chironomid larvae and sewage fungus have increased. Populations of coregonids, sturgeon, pike (Stizostedion) have collapsed; shad, alewife, smelt, and carp have increased. Several feasible remedial actions have been proposed; their practicability and efficacy is difficult to predict. (Voigtlander-Wisconsin)
W70-04496

DISTRIBUTION OF C-14 IN PRODUCTS OF PHOTOSYNTHESIS AND ITS RELATIONSHIP TO PHYTOPLANKTON COMPOSITION AND RATE OF PHOTOSYNTHESIS,
Ashland Coll., Ohio. Dept. of Biological Sciences.
John H. Olive, Duane M. Benton, and Jack Kishler.
Ecology, Vol 50, No 3, p 380-386, 1969. 6 fig, 2 tab, 31 ref.

Descriptors: *Lakes, *Photosynthesis, *Phytoplankton, Methodology, Standing crop, Proteins, Carbohydrates, Lipids, Growth rates, Lake Erie.
Identifiers: *Carbon-14, *Photosynthetic rate, Cascinodiscus, Aphanizamenon, Microcystis, Ceratium.

Distribution of carbon-14 in four dominant species of phytoplankton was determined from in situ cultures. Ethanol-soluble fractions of phytoplankton accounted for 25-60% of assimilated carbon-14; insoluble fractions accounted for 20-48%. Ion-exchange fractionation of ethanol-soluble fraction revealed 68-83% of carbon-14 in carbohydrate-lipid fraction; 8-23% in non-amino organic acid fraction and 3-20% in free amino acid fraction. Distribution of carbon-14 in different fractions varied with species of alga, rate of population increase and level of illumination. Rapidly-growing populations showed higher proportions of carbon-14 in protein fractions; high proportions of carbon-14 in carbohydrate-lipid fractions were associated with high photosynthetic rates. Graphical data include temporal variation in distribution of carbon-14 and in total and relative rates of photosynthesis. (Voigtlander-Wisconsin)

THE LIMNOLOGY AND PRODUCTIVITY OF THREE CALIFORNIA COLDWATER RESERVOIRS,
California State Dept. of Fish and Game, Sacramento. Inland Fisheries Branch.
Stephen J. Nicola, and David P. Borgeson.
California Fish and Game, Vol 56, No 1, p 4-20, 1970. 8 fig, 3 tab, 20 ref.

Descriptors: *Limnology, *Productivity, *Fish, *Reservoirs, Zooplankton, Rainbow trout, Primary productivity, Secondary productivity, Daphnia, Copepods, Dissolved oxygen, Brown trout, Trophic level, California, Food habits, Food chains.
Identifiers: *Sierra Nevada reservoirs, Lake Spaulding (Calif), Beardsley Reservoir (Calif), Icehouse Reservoir (Calif), Bosmina, Holopedium, Kokanee.

Three reservoirs on the western slope of the Sierra Nevadas yielded estimates of mean daily net primary productivity from 119 to 314 milligrams carbon/square meter (June through October). Mean standing crops of zooplankton ranged from 562 to 951 milligrams/square meter dry weight; mean annual yield of game fish ranged from 0.75 to 6.71 kilograms/hectare wet weight. Primary productivity appeared to be directly related to temperature and inversely related to flushing rate of the reservoirs. Rotifers were most numerous zooplankter but did not contribute significantly to total weight. Dominant zooplankton for Beardsley, Icehouse, and Spaulding Reservoirs were, respectively, (1) Daphnia and calanoid copepods, (2) cyclopoid copepods, and (3) Bosmina coregoni. Fisheries consisted of rainbow and brown trout in all three lakes and included kokanee in Icehouse. Game fish yield in Spaulding and Beardsley varied from 0.69 to 0.87 and 2.99 and 9.84 kilogram/hectare, respectively. Kokanee assumed a dominant role in the Icehouse fishery two years after introduction. Zooplankton dominated fish diets in Beardsley, aquatic invertebrates and terrestrial organisms dominated diets in Spaulding. Comparison of productivity indices suggest all three fisheries are under-utilized. (Voigtlander-Wisconsin)
W70-04498

BIOLOGY OF THE CRAYFISH ORCONECTES CAUSEYI AND ITS USE FOR CONTROL OF AQUATIC WEEDS IN TROUT LAKES,
Bureau of Sport Fisheries and Wildlife, Washington, D.C.
Jack L. Dean.
Bureau of Sport Fisheries and Wildlife, Technical Paper, No 24, 1969. 15 p. 8 fig, 3 tab, 14 ref.

Descriptors: *Crayfish, *Aquatic weeds, *Aquatic weed control, Ecology, Life history studies, Fecundity, Fish management.
Identifiers: *Trout lakes, Potamogeton, Myriophyllum, Ranunculus, Chara, Ceratophyllum, Elodea.

Control of submerged aquatic plants has been achieved in shallow lakes of the Southwest by introduction of the crayfish Orconectes causeyi. Crayfish growth is rapid during summer (June through late September). Both sexes attain maturity at 14 to 15 months; maximum ages of both sexes is about 37 months. Females produce high numbers of ovarian eggs (mean of 62 females was 588, maximum number was 1237); reduction to number of pleopod eggs was estimated to be 29%. O causeyi is a tertiary burrower, utilizing a variety of substrate types. It is primarily vegetarian (diet consisted of 51% algae, 27% vascular plant material, 18% detritus, and 4% animal food); cannibalism will occur under conditions of food scarcity. Weed control was proportional to crayfish population and proximity to a rocky substrate. Field and laboratory tests showed control or utilization of Potamogeton spp, Ceratophyllum, Ranunculus, Elodea, Myriophyllum, Chara, Najas, Cabomba, and Vallisneria. Crayfish did not control Polygonum, Scirpus, or Typha. Control includes habit of cutting vegetation at the substrate and uprooting vegetation. Comparison of life history data with those of O virilis suggests that the latter species may be an effective weed-control agent in the upper Midwest. (Voigtlander-Wisconsin)

EFFECTS OF IRRIGATION REGIMES ON GRAPEFRUIT PEEL AND PULP RELATIONSHIPS,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
A. Cohen, A. Goell, A. Rassis, and M. Gokkes.
Israel Journal of Agricultural Research, Vol 18, No 4, p 155-160, October 1968. 4 tab, 7 ref.

Descriptors: *Grapefruit, *Irrigation effects, *Crop response, *Irrigation practices, *Rates of application, Citrus fruits.
Identifiers: *Israel, *Peel/pulp ratio.

A higher peel/pulp ratio occured in grapefruit from trees receiving limited irrigation than was found in trees that were frequently and amply irrigated. Irrigation effects were most strongly marked during the rainless summer period, when the drier regimes inhibited peel growth relatively more than pulp growth. However, even though the peel grew less than the pulp, it concerned a smaller fraction of total growth and the final figures showed that the drier regimes yielded fruit with a higher peel/pulp ratio. ROW SPACING AND FERTILIZATION INFLUENCES ON FORAGE AND SEED YIELDS OF INTERMEDIATE WHEATGRASS, RUSSIAN WILDRYE, AND GREEN NEEDLEGRASS ON DRYLAND,
Agricultural Research Service, Sidney, Mont. Northern Plains Soil and Water Research Center; and Montana Agricultural Experiment Station, Bozeman.
A. L. Black, and L. L. Reitz.
Agronomy Journal, Vol 61, No 5, p 801-805, September-October 1969. 2 fig, 3 tab, 14 ref.

Descriptors: *Great Plains, *Fertilization, *Forage grasses, *Seeds, *Crop response, Phosphorous, Nitrogen compounds, Water utilization, Crop production, Semiarid climates.
Identifiers: *Row spacing, Seed yield.

The purpose of this five-year study was to determine the effects of row spacing and fertilization on forage and seed production of intermediate wheatgrass, Russian wildrye, and green needlegrass. These three grasses are commonly grown on the dry northern Great Plains and intensive soil management was practiced in order to study their maximum water-use efficiencies. The grasses differed in their response (forage, seed production, water use, and nitrogen and phosphorous recovery) to spacing and fertilizing combinations. Green needlegrass was particularly noticeable for its low water-use efficiency in comparison to the other grasses. It is concluded that the optimum row spacing is 107, 76, and 76 cm respectively for intermediate wheatgrass, Russian wildrye, and green needlegrass. 40 to 60 kg/ha of nitrogen with phosphorous added should be applied annually. (Carr-Arizona)
W70-04406

MOISTURE CONTENT OF COTTON LEAVES AND PETIOLES AS RELATED TO ENVIRONMENTAL MOISTURE STRESS,
Texas A and M Univ., College Station; and Texas Agricultural Experiment Station, El Paso.
D. E. Longenecker, and P. J. Lyerly.
Agronomy Journal, Vol 61, No 5, p 687-690, September-October, 1969. 3 fig, 16 ref.

Descriptors: *Moisture stress, *Soil moisture, *Cotton, *Leaves, *Soil-water-plant relationships, Irrigation, Timing, Irrigation efficiency, Moisture deficit, Arid lands, Soil types, Plant physiology, Wilting point.
Identifiers: *Petioles.

The purpose of the study was to determine the change over a period of time of leaf and petiole moisture content in cotton. The study interval began following irrigation and continued until permanent wilting developed. In both field and greenhouse conditions, there was a gradual decrease in leaf and petiole moisture percentage as soil moisture was depleted. Throughout this period the petioles showed the more uniform depletion curves and higher moisture percentages. This would indicate that petioles are more useful and dependable in registering changes in soil-water-plant relationships. Before this information could be used to predict when to irrigate, it appears it would be necessary to calibrate data for different soil types. (Carr-Arizona)
W70-04407

AN ECOLOGICAL SIGNIFICANCE OF SEASONAL LEAF VARIABILITY IN A DESERT SHRUB,
California Univ., Riverside. Dept. of Life Sciences.
G. L. Cunningham, and B. R. Strain.
Ecology, Vol 50, No 3, p 400-408, Late Spring 1969. 7 fig, 3 tab, 18 ref.

Descriptors: *Desert plants, *Variability, *Plant morphology, *Leaves, *Photosynthesis, Arid lands, Structure, Carbon dioxide, Resistance, Water vapor, Diffusion, Biorythms, Soil water, Seasonal, Precipitation (Atmospheric), On-site tests.
Identifiers: *Brittlebush, *Sonoran Desert, *Moisture status, Leaf structure.

The study was designed to find out to what extent seasonal leaf variability increases the survival capability of Encelia farinosa. This particular plant species was selected for observation because it is a perennial showing great seasonal variation in leaf structure and quantity. Field records established that leaf quantity and structure are controlled by environmental moisture status. Field observations also demonstrated the influence of leaf quantity and structure on CO sub 2 exchange capacity and water status of the shrub. These findings were corroborated by laboratory investigations, which also indicated that influence of leaf structure is due to alteration in the resistances to CO sub 2 and water vapor diffusion. The conclusion is that seasonal leaf variability provides Encelia farinosa with an increased ability to accumulate photosynthate in a desert environment. (Carr-Arizona)
W70-04414

EFFECTS OF WATER POTENTIAL ON GERMINATION OF LETTUCE, SUNFLOWER, AND CITRUS SEEDS,
California Univ., Riverside, Dept. of Horticultural Science.
Merrill R. Kaufmann.
Canadian Journal of Botany, Vol 47, No 11, p 1761-1764, November 1969. 3 fig, 1 tab, 6 ref.

Descriptors: *Moisture stress, *Seeds, *Germination, *Lettuce, *Citrus fruits, Arid lands, Semiarid climates, Solutes, Moisture availability.
Identifiers: *Water potential, *Sunflowers.

In arid and semiarid climates there may be a critical shortage of water at the time of seed germination. The study deals with the effect of controlled water potential or germination of citrus, sunflower, and lettuce seeds. The method for achieving nearly constant water potential without solute effect is based on the principles of Painter, Cox, and Boersma. For all three species tested the most rapid emergence occurred at 0 bars. Sunflowers germinated at water potentials as low as -8.0 bars, citrus at -4.7 bars, and lettuce at-4.1 bars. Citrus germinated most slowly, requiring 26 days at 0 bars to achieve 50% germination. Sunflowers reached 50% germination in 8 days at-4.1 bars, but lettuce required -2.3 bars before it could germinate at the same rate. (Carr - Arizona)
W70-04416

AN UNUSUAL PHOTONASTISM INDUCED BY DROUGHT IN PHASEOLUS VULGARIS,
Department of Agriculture, Lethbridge (Alberta). Research Station.
S. Dubetz.
Canadian Journal of Botany, Vol 47, No 10, p 1640-1641, October 1969. 2 fig, 9 ref.

Descriptors: *Beans, *Drought, *Moisture stress, *Crop response, *Plant physiology, *Phototropism, Water utilization, Turgidity, Thermal stress, Transpiration, Soil-water-plant relationships, Leaves, Solar radiation, Thermal capacity.
Identifiers: *Photonastism, Canada.

In an outdoor experiment Phaseolus vulgaris was subjected to moisture stress. 30 to 40 days after emergence some of the plants were placed under soil water stress of 8 bars. On hot, sunny days the stressed plants exhibited the photonastic phenomenon. Photonasty is considered a special case of phototropism in which the light response of mature plant tissue consists of turgor changes. Under conditions of extreme drought and intense sunlight the leaves of P. vulgaris orient themselves parallel to the incident light. In this position they will follow the course of the sun. This leaf orientation and movement apparently are adaptations to minimize transpiration and prevent thermal death. (Carr - Arizona)
W70-04417

EFFECT OF MOISTURE STRESS ON THE ABSORPTION AND TRANSPORT OF HERBICIDES IN WOODY PLANTS,
Agricultural Research Service. Crops Research Division; and Texas A and M Univ. Dept. of Range Science.
F. S. Davis, M. G. Merkle, and R. W. Bovey.
Botanical Gazette, Vol 129, No 3, p 183-189, September 1968. 5 fig, 4 tab, 14 ref.

Descriptors: *Herbicides, *2-4-5-T, *Absorbtion, *Moisture stress, *Mesquite, Chaparral, Brush control, Range management, Defoliants, Plant physiology, Arid lands, Semiarid climates, leaves, Analytical techniques, Vascular tissues, Turgidity.
Identifiers: *Picloram, *Winged elm.

Mesquite and winged elm were studied in a controlled environment to determine the effect of moisture stress on the absorption and distribution of 2,4,5-T and picloram. Moisture stress did not effect absorption of 2,4,5-T, but did reduce uptake of picloram in mesquite. Stress also reduced transport of the herbicides in both species, with reduction generally paralleling retarded growth. The greatest reduction in transport occurred either at moderate stresses or when extensive movement occurred under no stress. (Carr - Arizona)

2J. Erosion and Sedimentation

SOIL MOVEMENT IN AN ALPINE AREA,
Colorado State Univ., Fort Collins. Natural Resources Center.
W. D. Striffler.
Available from the Clearinghouse as PB-189 785, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 4 p, 3 ref. OWRR Project A-002-COLO.

Descriptors: *Soil erosion, *Alpine soil, *Tundra erosion, Sediment transport, Soil movement.

Erosion transects were established at two alpine sites in Colorado. Site variables included two aspects (north and south), two slope positions (upper and lower), and three slope classes ranging from five to sixty percent. Soil particle tagging with flourescent dye permitted soil migration to be observed. Small micro-plots were fitted with soil collectors to catch migrating soil particles for laboratory analysis. Maximum soil particle displacement on undisturbed steep mountain slopes averaged less than one meter over a two-year period. Particle movement is highly correlated with no deposition. Particle movement is also correlated with slope, position on slope, litter cover, rock cover, and infiltration rate. Surface soil particle, sprayed with flourescein dye remain sufficiently visible for observation over a two-year period.

HYDRAULIC RESISTANCE IN ALLUVIAL CHANNELS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Ben Chie Yen, and Ying-Chang Liou.
Available from the Clearinghouse as PB-189 789, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Illinois Water Resources Center, Research Report No 22, July 1969. 66 p, 24 tab, 5 fig, 51 ref, 1 append. OWRR Project A-033-ILL.

Descriptors: *Alluvial channels, Dimensional analysis, *Flow resistance, Hydraulics, Open-channel flow.
Identifiers: *Sediment.

An analytical study was conducted for the determination of the Weisbach resistance coefficient for flow in sand-bed straight channels. Available experimental data were reanalyzed based on dimensional analysis and fluid mechanics concepts. It was found that for flows having width to depth ratio greater than 5, there is a unique and systematic relationship among the Weisbach resistance coefficient f, and Froude number of the flow, and the sediment particle size to hydraulic radius ratio. The bed form which also is a dependent variable is also uniquely determined. For flow with Froude number less than 0.5 where its effect can be neglected, the resistance coefficient can be expressed as a function of the Reynolds number, sediment size to hydraulic radius ratio, and the sediment terminal fall velocity to shear velocity ratio. Application of the results for engineering purposes is also discussed. The technique for engineering applications of the results appear to be quite simple.

FUNCTIONAL RELATIONSHIPS BETWEEN DENUDATION, RELIEF, AND UPLIFT IN LARGE MID-LATITUDE DRAINAGE BASINS,
Maryland Univ., College Park. Dept. of Geography.
Frank Ahnert.
American Journal of Science, Vol 268, No 3, p 243-263, Mar 1970. 21 p, 7 fig, 2 tab, 21 ref.

Descriptors: *Erosion, *Topography, *Geomorphology, Geology, Precipitation (Atmospheric), Drainage density, Drainage patterns (Geologic), Land forming, Structural geology.
Identifiers: Geological uplift.

The mean denudation rate in mid-latitude river basins is directly proportional to mean basin relief. Mean annual precipitation has no noticeable effect upon the denudation rate. Without any uplift, the relief is reduced to 10% of its initial value in 11 million years; with isostatic compensation, this time increases to at least 18.5 million years. Establishment of a steady state relief would require a constant rate of uplift for more than 20 million years and thus is unlikely to occur. Oscillating rates of uplift cause corresponding oscillations of relief. The quantitative relationship between uplift, relief, and denudation may permit order-of-magnitude estimates of current rates of uplift. (Knapp-USGS)
W70-04076

THE NATURE OF KARSTIC PROCESSES IN THE PERMIAN HALOGEN SEDIMENTS OF THE DONETS BASIN USING THE BAKHMUT BASIN AS AN EXAMPLE (RUSSIAN),
N. S. Podorvanov, and Ye. A. Savichenko.
In: Trudy Soveshchaniya po Voprosam Kompleksnogo Izucheniya Rezhima Poverkhnostnykh i Podzemnykh Vod v Karstovykh Rayonakh (Proc of Conf on Complex Problems of Surface and Groundwater Systems in Karstic Regions), Upravleniye Gidrometeorologicheskoy Sluzhby, Ukr, SSR, p 80-83, 1969. 4 p.

Descriptors: *Karst, *Erosion, *Sediments, Geology, Clays, Limestones, Sands, Gypsum, Salts, Groundwater, Boreholes, Mining, Leaching, Groundwater movement.
Identifiers: Donets basin, USSR.

The geology of the Permian rocks in the Bakhmut basin and the development of the basin's karstic features are described. The karstic processes of the basin take place in the halogen-carrying formations of Lower Permian age located at relatively shallow depth. Leaching of these halogen formations is due to the circulation surface and underground waters and takes place down to depths of 40 to 250 m. (Gabriel-USGS)

KARST FORMATION AT THE ARTEMOVSK OCCURRENCE OF ROCK SALT (RUSSIAN),
I. M. Aleksandrov.
In: Trudy Soveshchaniya po Voprosam Kompleksnogo Izucheniya Rezhima Poverkhnostnyky i Podzemnykh Vod v Karstovykh Rayonakh (Proc of Conf on Complex Problems of Surface and Groundwater Systems in Karstic Regions), Upravleniye Gidrometeorologicheskoy Sluzhby, Ukr, SSR, p 73-79, 1969. 7 p, 1 fig, 1 tab.

Descriptors: *Karst, *Aquifers, *Groundwater, *Mineral industry, *Salts, Discharge (Water), Mine drainage, Mine water, Mining engineering, Water chemistry, Sulfates, Deterioration, Geology, Sandstones, Runoff, Surface runoff, Water circulation, Boreholes, Corrosion.
Identifiers: *USSR, Artemovsk mines.

The formation of karstic features in the rock salt horizon of the Artemovsk rock-salt mine is described. The discharge values of water in shafts and tunnels of the mine, the geology of water-bearing horizons and streams, and the damage done to the concrete used in the mine are also discussed. (Gabriel-USGS)
W70-04107

A DEVICE FOR DETERMINING SEDIMENTATION RATES IN RESERVOIRS,
Bureau of Sport Fisheries and Wildlife, Yankton, S. Dak. North Central Reservoir Investigations.
Bruce C. Cowell, and Patrick L. Hudson.
Limnology and Oceanography, Vol 13, No 1, p 196-198, 1968. 2 fig.

Descriptors: *Sedimentation rates, *Reservoirs, Deposition (Sediments), Cores, Sampling, Currents (Water), Velocity, SCUBA diving.
Identifiers: *Sediment trap, Gross sedimentation rates, Sediment composition.

A more rapid determination of sedimentation rates and sediment composition in reservoirs than core sampling and not subject to errors associated with open containers can be effected with the apparatus described. It can be stabilized at desired depths so that flocculent bottom materials are not collected, and it can be closed before retrieval. The data obtained with this device are more closely representative of the gross sedimentation rate than the net rate that actually prevails, and thus determinations of energy flux tend to be artificially high. For this reason, the apparatus is used only to provide comparative data between stations within a reservoir or between reservoirs in the same river system. In operation, this sediment trap, is slowly lowered to the bottom with an anchor and messenger cable. Bottom materials are disturbed by the anchor as little as possible. After 24-48 hours a messenger is dropped and the sediment trap retrieved. The operation was observed with SCUBA equipment and current was found the major factor limiting use. The device could be modified for use in currents so that it would remain vertical, regardless of apparatus tilt. (Jones-Wisconsin)

NEW METHODS OF PROBABILITY CALCULATIONS FOR DISCHARGES AND NON-SCOURING VELOCITIES IN RIVERS' CROSS-SECTIONS,
Institute of Building Technics, Warsaw (Poland).
Walenty Jarocki.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 73, p 589-594, 1967. 6 p, 3 tab, 2 ref.

Descriptors: *Erosion, *Scour, *Probability, *Statistical methods, *Streamflow forecasting, Discharge (Water), Stage-discharge relations, Channel morphology.
Identifiers: Scour prediction.

New methods of calculation of probabilities of discharges as well as sediment balance for the calculation of scour near hydraulic structures are presented. The methods are based on the assumption that the discharges of various probability should be calculated taking into account the maximum discharge which can occur in the given basin. According to the principle of conservation of energy the river bed will not scour if the quantity of sediment is the same downstream and upstream of the considered contract river cross-section. (Knapp-USGS)

ROLE OF SALT WEDGE IN BAR-FINGER SAND AND DELTA DEVELOPMENT,
Northeastern Illinois State Coll., Chicago. Dept. of Geology.
George T. Moore.
The American Association of Petroleum Geologists Bulletin, Vol 54, No 2, p 326-333, Feb 1970. 8 p, 6 fig, 4 tab, 10 ref.

Descriptors: *Deposition (Sediments), *Sediment transport, *Saline water intrusion, *Mississippi River, *Deltas, Sedimentation, Sedimentary structures, Sand bars, Coasts.
Identifiers: Bar-finger sands.

Linear, continuous deposits, composed primarily of fine and very fine sand, which occupy the channels and distributaries of the lower Mississippi River are termed 'bar-finger sands.' These deposits originate as distributary-mouth bars but their development continues after the river has prograded beyond the original site of bar formation. The intrusion of salt water into the river channel during periods of low discharge reduces the current directly above the bed and causes deposition of the coarser fractions of sand along the channel. Because this phenomenon occurs during much of the year, a net buildup of sediment occurs. (Knapp-USGS)

EFFECT OF CONCENTRATION ON SEDIMENT DISTRIBUTION,
Missouri Univ., Columbia. Dept. of Civil Engineering.
A. T. Hjelmfelt, and C. W. Lenau.
ASCE Proceedings, Journal Hydraulics Division, Vol 95, No HY5, p 1775-1779, Sept 1969. 5 p, 2 fig, 3 ref. OWRR Project No A-015-MO

Descriptors: *Sedimentation, *Suspended load, *Settling velocity, Deposition (Sediments), Mathematical studies, Particle size, Sediment load, Stokes law, Suspension.
Identifiers: Sediment concentration.

The effects of sediment concentration on the fall velocity of suspended material are studied analytically. The results are shown by graphs. (Knapp-USGS)
W70-04320

THE RELATION OF TURBULENCE TO DEPOSITION OF MAGNETITE OVER RIPPLES,
Geological Survey, Fort Collins, Colo.
Raul S. McQuivey, and Thomas N. Keefer
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D244-D247, 1969. 4 p, 3 fig, 2 ref.

Descriptors: *Deposition (Sediments), *Sediment transport, *Turbulence, *Ripple marks, *Hydraulic models, Settling velocity, Density, Separation techniques, Sedimentary structures, Turbulent flow, Erosion, Scour.
Identifiers: Heavy minerals, Magnetite, Sorting.

Sorting of magnetite and other heavy minerals from predominantly quartz bed material occurs because of variations in turbulent shear stress from trough to crest of ripples and because for particles less than one-tenth millimeter in diameter critical shear stress is a function of density only. The sorted particles of heavy minerals tend to accumulate just upstream of ripple crests. It is suggested that artificially generated turbulence could be employed to sort small-sized heavy-mineral particles from sediment flows. (Knapp-USGS

AN ELECTRO-OPTICAL SYSTEM FOR MEASUREMENT OF MEAN AND STATISTICAL PROPERTIES OF SEDIMENT SUSPENSIONS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
John R. Glover, P. K. Bhattacharya, and John F. Kennedy.
U S Army Corps of Engineers, Coastal Engineering Research Center, Washington, D C, Technical Report IIHR No 120, October 1969. 26 p. 15 fig.

Descriptors: *Erosion, *Sediment distribution, Sedimentation, Sediment-water interfaces, Instrumentation, Measurement, Beach erosion, Alluvial channels, Estuaries, Waves (Water), Shoals, Computers, Suspension.
Identifiers: *Suspended sediment, *Erosion transport, *Electro-optical measurement, Shoaling waves, Optical transducer, Multi-phase flow.

To achieve measurements of the mean, periodic, and random components of the concentration of suspended products or erosion, a new electro-optical system has been developed. The system includes a transducer of a gallium arsenide diode and a silicon planer diode as a light sensor. The intensity of light is modulated by the suspended material in the gap between the light source and sensor. The chassis is provided with signal analyzing circuitry, an analog- to-frequency converter, and multiplier circuits. The device measures suspension to 100 parts/million, computes the mean concentration,

the mean square of the fluctuation, and the correlation between the concentration and another signal supplied by the system. (Wilde-Wisconsin)

SOLUTION GEOCHEMISTRY OF THE WATER OF LIMESTONE TERRAINS,
Kentucky Water Resources Inst., Lexington.
John Thrailkill.
Available from the Clearinghouse as PB-189 773, $3.00 in paper copy, $0.65 in microfiche. Research Report 19, Kentucky Water Resources Institute, Lexington, 1970. 125 p, 10 tab, 22 fig, 26 ref. OWRR Project A-009-KY.

Descriptors: Aquifers, Limestone, Vadose seepage, *Geochemistry, Calcite, Water quality, Analytical techniques, Kentucky, Calcium carbonate, Carbon dioxide, Carbonates, Karat.
Identifiers: *Limestone aquifer, *Groundwater.

Limestone groundwater flows mainly in openings it has solutionally enlarged, thus an understanding of the water's state of saturation relative to calcite (the principal mineral component of limestone) is fundamental to an understanding of the nature and evolution of the limestone aquifer. This study investigated the Mammoth Cave-Sinkhole Plain (MCSP) and Cave Hollow (CH) aquifers in Kentucky. Both aquifers were always undersaturated with calcite. Except for completely ventilated vadose flows and some vadose seepage, all recharges sampled were also undersaturated. The lack of saturation in the MCSP aquifer was due to the introduction of carbon dioxide into the water in amounts difficult to explain by the above recharges. In both vadose flows and seepage, undersaturation tended to correlate directly with flow volume, and there was an inverse correlation between the amount of carbon dioxide and calcite saturation in most of the waters sampled, suggesting seasonal invariance of carbon dioxide content of the water prior to outgassing. Results suggest solutional enlargement is greatest near recharge points in 'ventilated' aquifers (CH) but the carbon dioxide introduction phenomenon (MCSP) allows solution over wide areas in 'unventilated' aquifers.

COMPOSITION OF INTERSTITIAL WATERS OF MARINE SEDIMENTS: TEMPERATURE OF SQUEEZING EFFECT,
Southern California Univ., Los Angeles.
James L. Bischoff, Randall E. Greer, and Antonio O. Luistro.
Science, Vol 167, No 3922, p 1245-1246, Feb 1970. 2 p, 1 fig, 7 ref. NSF Grant GA 11490.

Descriptors: *Connate water, *Cores, *Test procedures, *Physicochemical properties, Sampling, Porous media, Water chemistry, Temperature, Sediments, Laboratory tests, Anion exchange, Potassium, Chlorides, Magnesium.
Identifiers: *Pore water chemistry, *Marine sediments, Interstitial waters.

To determine that potassium enrichments in interstitial water from marine sediments are due, in part, to temperature effects from sampling and squeezing, as recent studies indicated, a series of duplicate samples were tested using freshly collected core and then squeezing one set at in situ temperature and the other at laboratory temperature. Warming the samples to room temperatures prior to extraction of water from the sediments accounts for apparent enrichments of potassium ion (13.3%) and chloride ion (1.4%) and depletions of magnesium ion (2.5%) and calcium ion (4.9%). These differences result from changes in ion-exchange selectivity as a function of temperature. It is concluded that for accurate analyses of pore water chemistry, extraction of the pore water must be done at the in situ temperature of the sediment. (Lang-USGS)

SODIUM HAZARD OF BICARBONATE IRRIGATION WATERS,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
P. F. Pratt, and F. L. Bair.
Soil Science Society America Proceedings, Vol 33, No 6, p 880-883, Nov-Dec 1969. 4 p, 5 fig, 2 tab, 13 ref.

Descriptors: *Irrigation water, *Bicarbonates, *Sodium, Calcium carbonate, *Water chemistry, Acidity, Soils, Zeolites, Evapotranspiration, Water quality, Precipitation (Atmospheric), Lysimeters.
Identifiers: *Sodium hazard, Precipitation index.

Results of a 6-year lysimeter experiment show that the water quality value based on the precipitation index (PI) for calcium carbonate satisfactorily estimated the effect of the water on the composition of saturation extracts of soil samples, except where Na precipitation occurred. Essential conditions for Na precipitation, presumably as a zeolite, were a pH above 8.6 and time for dissolution of reactants from the soil and formation of the product. Tree trunk diameter growth by lemon trees (Citrus lemons) and evapotranspiration were linearly correlated with water quality values based on PI. (Carstea-USGS)

THE CURRENT TRITIUM CONTENTS OF NATURAL WATERS,
Akademiya Nauk SSSR, Moscow. Institut Geokhimii i Analiticheskoi Khimii.
A. P. Vinogradov, A. L. Devirts, and E. I. Dobkina.
Trans from Geokhimiya, No 10, p 1147-1162, 1968. Geochemistry International, Vol 5, No 5, p 952-966, 1968. 15 p, 4 fig, 5 tab, 50 ref.

Descriptors: *Tritium, *Surface waters, Fallout, Tracers, Water chemistry, Water quality, Hydrogen, Water analysis, Radiochemical analysis.
Identifiers: *USSR, Pakhva River, Oka River, Moscow.

Tritium analyses were made on a number of water and plant samples collected in the western USSR. The analyses were made by gas-proportional counting. The counters were steel or copper in conventional steel shields with a ring of geiger guard counters in anticoincidence with the main counter. The tritium content of atmospheric precipitation and water vapor near Moscow ranged from 400 to 800 TU in 1966 and from 40 to 300 TU in 1967. Lakes in the central and NW USSR ranged from 170 to 370 TU in 1967, while the Pakhva and Oka Rivers near Moscow in September 1967 had 65 and 34 TU, respectively. (Knapp-USGS)

NITROGEN-FIXING BLUE-GREEN ALGAE IN SWEDISH SOILS,
Uppsala Univ. (Sweden). Inst. of Physiological Botany.
Ulf Granhall, and Elisabet Henriksson.
Oikos, Vol 20, No 1, p 175-178, 1969. 3 tab, 15 ref.

Descriptors: *Nitrogen, *Nitrogen fixation, *Soil algae, Soils, Soil tests, Hydrogen ion concentration, Soil moisture.
Identifiers: *Blue-green algae, Acetylene reduction technique, Soil nitrogen, Heterocysts, Swedish soils, Nitrogen-fixing algae.

The relative abundance of nitrogen-fixing algae in different Swedish soils was studied in situ and in monocultures using the acetylene reduction technique. Sampling sites were distributed over entire Sweden and Gotland Island. Regardless of geographic location, soil properties exerted decisive influence on the presence and density of the organisms. Soils with reaction between pH 3 and pH 5 were free from blue-green algae; their occurrence was also greatly reduced by deficiency of moisture and low supply of nutrients. An abundant occurrence of nitrogen-fixing forms, including genera of Nostoc, Anabaena, Calothrix, and Tolypothrix, was confined to alkaline or slightly acid, moist soils which are low in combined nitrogen. The organisms are obviously of little importance to forest soils of the investigated region. (Wilde-Wisconsin)

0-18/0-16 RATIOS IN SNOW AND ICE OF THE HUBBARD AND KASKAWULSH GLACIERS,
Alberta Univ., Edmonton. Dept. of Geology; and Alberta Univ., Edmonton. Dept. of Physics.
D. S. Macpherson, and H. R. Krouse.
In: Isotope Techniques in the Hydrologic Cycle, Geophysical Monograph Series, No 11, American Geophysical Union, p 180-194, 1967. 15 p, 13 fig, 9 tab, 25 ref.

Descriptors: *Glaciers, *Ice, *Snow, Oxygen, Analytical techniques, Precipitation (Atmospheric), Snowmelt, Tracers.
Identifiers: *Hubbard Glacier, *Kaskawulsh Glacier, St. Elias Mountains.

One hundred samples collected from the Hubbard and Kaskawulsh glaciers in the St. Elias Mountains during the summer of 1963 were analyzed for 0-18 and 0-16. The delta 0-18/0-16 values ranged from -18 to -29 (SMOW), with an average of about -23. Pits that were studied before extensive melting showed definite trends, with the more negative values corresponding to winter precipitation. Pits studied later in the season had the seasonal trend masked by the action of downward percolating meltwaters. The average of all pits and boreholes studied above the firn line gave no indication of an altitude variation larger than the sampling error. A longitudinal profile below the firn line showed much scatter in the 0-18 value, but the average trend was a decrease in going down-glacier from the firn line to the terminus. A transverse profile below the firn line which sampled 3 main ice streams gave remarkably consistent values near the margins, whereas the stream centers had decidedly more positive or negative values. These results are considered in terms of accepted modes of glacier flow. Precipitation studies exhibited much scatter and did not show the expected altitude variation. Comparison of the over-all data with that of other workers shows a number of consistencies. This comparison also suggests that much of the precipitation in the area is derived from the Pacific Ocean rather than from inland sources. (Carstea-USGS)
W70-04260

U.S. GEOLOGICAL SURVEY WATER-QUALITY DATA IN THE WILLAMETTE BASIN, OREGON, 1910-64,
Geological Survey, Portland, Oreg.
R. J. Madison.
Geological Survey Basic-Data Release, Mar 1966. 40 p, 3 fig, 2 tab, index.

Descriptors: *Water quality, *Oregon, Water chemistry, Water analysis, Data collections, Hydrologic data, Streams, Rivers, River basins, Water pollution.
Identifiers: Willamette River basin (Ore).

This report presents chemical analyses of water samples collected in the Willamette Basin, Oreg., and analyzed by the U.S. Geological Survey. All data collected through September 1964 have been tabulated through the Survey's Automatic Data Processing system. These tabulations have been prepared to make the data available to all agencies working on the comprehensive study of the Willamette Basin. Because the Sandy River basin is a part of the study area, analyses of samples from that basin are also included. (Knapp-USGS)

CHANGES IN THE CLAY-WATER SYSTEM WITH DEPTH, TEMPERATURE, AND TIME,
Georgia Inst. of Tech., Atlanta. Water Resources Center.
C. E. Weaver, and Kevin C. Beck.
Available from the Clearinghouse as PB-189 168, $3.00 in paper copy, $0.65 in microfiche. Water Resources Center, Georgia Institute of Technology WRC-0769, Oct 1969. 95 p, 6 tab, 24 fig, 101 ref. OWRR Project A-008-GA

Descriptors: *Montmorillonite, *Illite, *Clay minerals, *Water chemistry, *Geochemistry, *Cations, Cation exchange, Cation adsorption, Anion exchange, Ion exchange, Ion transport, Hydrogen ion concentration, Pore pressure, Organic matter, Sodium, Potassium, Calcium, Manganese, Aluminum, Calcite.
Identifiers: *Interstitial water, *Interstitial ions.

An objective of the study was to determine the changes in the chemistry of the interstitial water of muds during burial. Side wall core samples of mud, ranging from 4,233 feet to 16,450 feet, were obtained from a well in the Mississippi Delta area. Analysis showed that the concentration of cations in the interstitial waters was approximately twice that of sea water. Na and K were more abundant and Ca and Mg less abundant than in sea water. K and Mg increase with depth. The anion concentration is HCO3 much greater than SO4 much greater than Cl. Cl is flushed from the system and systematically decreases with depth. SO4 is concentrated by filtering and HCO3 is created by the decomposition of organic matter and calcite. Na is the major exchange cation in the shallow samples and Ca in the deeper samples. Most of the exchangable Mg is gone at a depth of 4,233 feet. With depth montmorillonite layers alter to illite and chlorite layers even though the Al2O3/K2O and Al2O3/MgO ratios remain constant. There is some rearrangement of the elements in the solid phase but for complete conversion of montmorillonite to illite and chlorite, K and Mg must be added from below. (Conway-Georgia Tech)
W70-04295

ISOTOPIC COMPOSITION AND ORIGIN OF THE ATMOSPHERIC WATER VAPOR IN THE REGION OF LAKE LEMAN (IN FRENCH),
Pisa Univ. (Italy). Lab. of Nuclear Geology.
J.-Ch. Fontes, and R. Gonfiantini.
Earth and Planetary Science Letters, Vol 7, No 4, p 325-329, Jan 1970. 5 p, 1 fig, 3 tab, 9 ref.

Descriptors: *Evaporation, *Lakes, *Stable isotopes, *Tracking techniques, Water vapor, Mixing, Meteorology, Chemistry of precipitation, Distribution patterns, Humidity, Hydrologic cycle.
Identifiers: Lake Leman (Switzerland).

The isotopic composition of the atmospheric water vapor over Lake Leman changes regularly with the distance from the water surface. This fact indicates that the vapor results from a mixing of the vapor evaporated from the lake with the regional atmospheric vapor. The fractions of these two vapors of different origin are evaluated in each sample on the basis of the isotopic data. The method permits estimation of the climatic zone of influence of the lake in the atmosphere.

RECENT DISSOLVED-OXYGEN MEASUREMENTS IN THE GULF OF MEXICO DEEP WATERS,
Office of Naval Research, Washington, D.C.; Texas A and M Univ., College Station. Dept. of Oceanography; and National Science Foundation, Washington, D.C.
Worth D. Nowlin, Jr., David F. Paskausky, and Hugh J. McLellan.
Journal of Marine Research, Vol 27, No 1, p 39-44, Jan 15, 1969. 6 p, 4 fig, 1 tab, 4 ref. ONR Contract Nonr 2119 (04).

Descriptors: *Dissolved oxygen, *Gulf of Mexico, Water chemistry, Water quality, Water temperature, Sea water.
Identifiers: Yucatan Basin.

Because in 1963 it was suggested that rather large gradients in dissolved oxygen exist in the Gulf of Mexico below a sill depth of between 1500 m and 1900 m, measurements were made on three cruises during 1966 and 1967. No clearly discernible horizontal variation in dissolved oxygen was found in these waters. Only slight vertical oxygen gradients were measured below the sill depth; the mean value obtained is approximately 5.0 ml/liter. The data obtained in 1966 and 1967 are compared with data obtained on 7 previous cruises in 1935, 1958, 1959, 1962, and 1964. (Knapp-USGS)

DETERMINATION OF MERCURY IN NATURAL WATERS BY COLLECTION ON SILVER SCREENS,
Geological Survey, Denver, Colo.
Margaret E. Hinkle, and Robert E. Learned.
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75 per copy Geological Survey Research 1969, Professional Paper 650-D, p D251-D254, 1969. 4 p, 6 tab, 12 ref.

Descriptors: *Water analysis, *Trace elements, *Geochemistry, Water chemistry, Separation techniques, Analytical techniques, Spectrophotometry.
Identifiers: Mercury analysis.

A method for determining nanogram quantities of mercury in natural waters is described wherein mercury is collected on silver screens immersed in samples acidified with hydrochloric acid and the collected mercury is measured by heating the screens in a mercury-vapor absorption detector. As little as 10 nanograms of Hg in 100 ml of water can be detected by this procedure. The speed and simplicity of this method permit its use in hydrogeochemical surveys where mercury is utilized as a pathfinder element. (Knapp-USGS)

Descriptors: *Water analysis, *Stable isotopes, *Radioisotopes, *Carbon radioisotopes, *Separation techniques, Water chemistry, Chemical precipitation, Filtration.
Identifiers: Carbon-13 analysis.

The best method for separating the dissolved carbonate species from natural water in order to determine C-13 value of carbon in the aqueous phase appears to be a direct-precipitation method. This method consists of adding ammonium hydroxide strontium chloride solution directly to the sample of natural water to be analyzed. The strontium carbonate thus formed precipitates, and is subsequently separated, dried, and analyzed for C-13. The ammonium hydroxide strontium chloride solution can absorb carbon dioxide from the air; it is therefore extremely important that both the water sample and the prepared solution not be exposed to the air during handling and filtration. Exposure for a few minutes will cause contamination and give incorrect C-13 values. (Knapp-USGS)

NITRATE DISTRIBUTION IN THE SUBARCTIC NORTHEAST PACIFIC OCEAN,
Washington Univ., Seattle. Dept. of Oceanography; and Fisheries Research Board of Canada, Nanaimo, British Columbia. Pacific Oceanographic Group.
G. C. Anderson, T. R. Parsons, and K. Stephens.

Deep-Sea Research, Vol 16, p 329-334, 1969. 3 fig, 13 ref.

Descriptors: *Nitrates, *Distribution, *Pacific Ocean, *Subarctic, Seasonal, Phytoplankton, Surfaces, Depth, Primary productivity, Nutrients, Thermocline, Washington, Oregon, Coasts, Gulfs, Alaska, Velocity, Chlorophyll, Light intensity.
Identifiers: *Northeast Pacific Ocean, Isohaline zone, Bering Strait, West wind drift.

Data are presented on nitrate distribution in the subarctic Northeast Pacific Ocean. Data on other oceanographic parameters were collected simultaneously with the nitrate information and have confirmed the general oceanographic features governing production. Samples were collected during 1966 and 1967 at Ocean Weather Station P, on cruises in the North Pacific Ocean during 1964-1967 primarily for fish tagging, and during cruises of the R V Brown Bear in 1964 and 1965 off the Washington and Oregon coasts, eastward. Over most of the area nitrate is present at the surface throughout the year at a concentration above that limiting phytoplankton growth. Within coastal regions and south of about 45 degrees north, nitrate may become depleted during the spring and summer. It is suggested that maintenance of high nitrate concentrations over much of the area is due to relatively intensive entrainment of deep water into the upper zone coupled with a slow rate of nitrate removal by primary producers. Nitrate depletion in the southern area may be explained by less intensive entrainment of deep water and utilization of nutrients by a subsurface phytoplankton maximum beneath the seasonal thermocline. (Jones-Wisconsin)

ON THE DISTRIBUTION OF MAJOR NUTRIENTS AND PHYTOPLANKTON IN THE TAMAR ESTUARY,
Brussels Univ. (Belgium). Laboratoire de Botanique Systematique et d'Ecologie.
J. P. Mommaerts.
Journal of the Marine Biological Association of the United Kingdom, Vol 49, No 3, p 749-765, 1969. 7 fig, 2 tab, 30 ref, append.

Descriptors: *Distribution, *Nutrients, *Phytoplankton, Salinity, Phosphates, Nitrates, Silicates, Seasonal, Nannoplankton, Tidal waters, Temperature, Diatoms, Dinoflagellates, Marine algae, Littoral, Benthic flora, Brackish water, Fresh water, Scenedesmus, Trace elements.
Identifiers: *Tamar Estuary (England), Ionic composition, Exchange ratio, Evolution, Ultraplankton, Net-phytoplankton, Composition, Skeletonema, Prorocentrum, Nitzschia, Cryptomonas, Gymnodinium, Flagellates, Melosira, Navicula, Thalassiosira, Gyrodinium, Heterocapsa, Peridinium, Asterionella, Chaetoceros, Synedra, Corethron, Rhizosolenia, Dinophysis, Phaeocystis, Gonyaulax, Anabaena, Achnanthes, Cocconeis.

The Tamar estuary (England) has been surveyed from March to September 1968 for major ecological factors--especially chemical--and the nature and succession of phytoplanktonic populations in the eu-, poly- and mesohaline zones. Salinity distributions and variations were measured to provide a preliminary picture of the general circulation. Tidal flows appear to have most effect on water movement. Importance of flow and exchange ratios is emphasized. Major nutrients (phosphates, nitrates, and silicon) have been analyzed and peculiar patterns of vertical distribution are discussed. Decrease in nutrients content--with salinity 28 parts/thousand as index--is inversely correlated to the spring and summer blooming of nannophytoplankton. Distribution and evolution of various groups of phytoplankton are given. Comparison with open-sea data indicates which of the microphytoplankton is indigenous; most of the species borne from the sea cannot survive the salinity change. It is suggested that the exchange ratio controlling growth is low in the Tamar (great abundance and diversity of species, low flow ratio and the Sound as transitory region), but further studies on circulation patterns are needed to clarify this assumption. (Jones-Wisconsin)

PHYTOPLANKTON AND RELATED WATER-QUALITY CONDITIONS IN AN ENRICHED ESTUARY,
Geological Survey, Tacoma, Wash.
Eugene B. Welch.
Journal Water Pollution Control Federation, Vol 40, No 10, p 1711-1727, 1968. 10 fig, 27 ref.

Descriptors: *Analytical techniques, *Aquatic algae, *Aquatic microbiology, *Aquatic productivity, Biochemical oxygen demand, Cycling nutrients, Diatoms, Environmental effects, Essential nutrients, Eutrophication, Light intensity, Light penetration, Limnology, Nitrogen compounds, Nuisance algae, Nutrient requirements, Nutrients, Phosphorus compounds, Photosynthetic oxygen, Physiological ecology, Phytoplankton, Estuaries, Pollutant identification, Sewage, Sewage disposal, Sewage effluents, Water pollution control, Water pollution effects, Water pollution sources.
Identifiers: *Seattle (Wash), Renton Treatment Plant, Duwamish estuary (Wash).

Ammonia, soluble phosphate, and total phosphate concentrations were observed to increase in the Duwamish estuary, Washington, following initial discharge of effluent from the Renton Treatment Plant at Seattle. A phytoplankton bloom dominated by marine species occurred in the lower estuary in August 1965, about 1.5 months following the nutrient increase. A bloom did not occur in 1964, prior to effluent discharge from the treatment plant, but some evidence shows that algal activity was great in August 1963. The nutrient increase in 1965 probably was not the sole factor causing the bloom during that summer because: (a) the pre-effluent nutrient concentrations in 1963 and 1964 were relatively high; (b) a bloom also occurred at the furthest downstream station where no increase in nutrients was apparent in 1965 over that of the preceding two years; (c) a bloom probably occurred in 1963, before the addition of nutrients from the plant; and (d) the bloom maximum did not occur in 1965 until about 1.5 months after the nutrient increase, when discharge and tidal exchange conditions were minimum. Bloom timing seemed related most closely to hydrographic conditions. (Fitzgerald-Wisconsin)

THE ECOLOGY OF SHALLOW WATER MEIOFAUNA IN TWO NEW ENGLAND ESTUARIES,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
John H. Tietjen.
Oecologia (Berl), Vol 2, p 251-291, 1969. 6 fig, 12 tab, 38 ref.

Descriptors: *Aquatic life, *Estuaries, Nematodes, Mollusks, Copepods, Amphipoda, Hydrogen ion concentration, Biomass, Diatoms, Chlorophyta, Chrysophyta, Bottom fauna, Nematodes, Periphyton.
Identifiers: *Meiofauna, Taxa, Subtidal meiofauna, Maldanid polychaetes, Rose Bengal, TAF, Triethanolamine formalin, Ostracods, Polychaetes, Lamellibranchs, Chlorophyll a, Turbellaria, Hydrozoa, Epigrowth feeders, Epiphytic algae, Pennate diatoms, Filter-feeding Harpactaicoidea, Vertical distribution, Niantic River estuary (Conn), Pettaquamscutt River estuary (R I).

A study made between October 1964 and October 1965, of distribution and abundance of shallow subtidal meiofauna (passing a 0.50 millimeter mesh screen and retained on a 0.074 millimeter mesh screen) in four habitats of Niantic and Pettaquamscutt estuaries in southeastern New England. Temporal changes in major taxa to changes in environment and seasonal changes with possible causes are presented. Total numbers of meiofauna varied between 1,184 and 5,163 organisms/10 square centimeters, and wet weights between 8.5 and 62.5 milligram/10 square centimeter. Nematodes were the dominant group, comprising between 58 and 90% of total fauna and 64% of the total biomass. Among the nematodes, epigrowth-feeding species were dominant at all four stations, showing marked seasonal changes in species composition. Epigrowth-feeding species reached maximum density in spring and summer and deposit and omnivorous-feeding species in fall and winter. Polychaetes, amphipods, and lamellibranchs were most abundant in the summer, while Ostracods were abundant in late summer, fall, and winter in association with detritus increase. Harpactacoid copepods were inconsistent in their seasonal distributions. Approximately 80% of all meiofauna were found in the upper 3 centimeters of sediment. (Haskins-Wisconsin)

OPERATION OF A REVERSE OSMOSIS DESALINATION UNIT AT WEBSTER, SOUTH DAKOTA,
Aerojet-General Corp., El Monte, Calif.

Warren H. Bossert, and Gordon A. Fluke.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $1.50. Office Saline Water Research and Development Progress Report No 427, May 1969. 107 p, 14 fig, 8 tab, 3 ref, 6 append. OSW Contract No 14-01-0001-1181.

Descriptors: *Water quality, *Desalination processes, *Reverse osmosis, Brackish water, Wells, Membranes, Deposition (Sediments), Flow, Operation and maintenance, Statistical methods, Model studies, Regression analysis, Potable water.
Identifiers: US Public Health Service, *Drinking water standards.

The quality of the product water obtained through reverse osmosis of brackish well waters in Webster, South Dakota met the U.S. Public Health Service Drinking Water Standards. A sharp decline in flow rate was observed during the first week of operation. This is believed to be a result of sediment deposition on the membranes. The original flow rate was not restored in spite of using various types of feedwater pretreatments. Maintenance of the plate and frame osmotic unit required less than 1% of the available operating time. Statistical analysis by fitting regression models to predict product-quantity and product-quality responses was made on a representative set of data. (Carstea-USGS)

SYNTHESIS AND EVALUATION OF NEW MEMBRANE CANDIDATES FOR APPLICATION IN REVERSE OSMOSIS,
Peninsular ChemResearch, Inc., Gainesville, Fla.
Thomas W. Brooks, and Carl L. Daffin.
Report available for sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price 50 cents. Office of Saline Water Research and Development Progress Report No 460, Oct 1969. 33 p, 1 fig, 11 tab, 31 ref. OSW Contract No 14-01-0001-1260.

Descriptors: *Membranes, *Membrane processes, *Reverse osmosis, *Desalination processes, Cellulose, Osmotic pressure, Sodium chloride, Hardness (Water), Permeability, Performance, Compaction, Selectivity.
Identifiers: *Syndiotactic membranes, Acrylonitrile.

A noncellulosic synthetic polymer was shown to possess osmotic transport characteristics comparable in all respects to dense cellulose acetate. Syndiotactic poly (vinyl alcohol) membranes showed rather poor selectivity for aqueous sodium chloride feed solutions. However these membranes have shown promise for hard water applications. The attempts to improve their selectivity by grafting with acrylonitrile were not successful. The effects of grafting appeared to be a decrease in water permeability and an increase of compaction resistance. (Carstea-USGS)

DEVELOPMENT OF WATER PURIFICATION SYSTEMS BASED ON REVERSE OSMOSIS,
Pratt and Whitney Aircraft, East Hartford, Conn.
R. C. Ellington.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $2.25. Office of Saline Water Research and Development Progress Report No 410, Apr 1969. 154 p, 76 fig, 27 tab, 7 ref, 4 append. OSW Contract No 14-01-0001-1113.

Descriptors: *Desalination processes, *Membranes, *Reverse osmosis, Water purification, Brackish water, Filtration, Bacteria, Scaling, Porous media, Performance, Hydrodynamics.
Identifiers: Polarization effects, Feedwater.

The performance of compact desalination membrane cartridges consisting of three composite membranes with variable surfaces was tested. The concentration polarization effects were very small. Reverse-osmosis membranes reinforced with nylon cloth were also tested for brackish waters. Feedwater pretreatment, such as filtration and bacteria removal, should be incorporated into all test systems as membrane fouling and scale buildup may affect membrane performance. Compaction studies should be extended to determine if membrane performance is either linear or logarithmic with respect to time. An endurance test performed on the compact cartridge and on individual membranes should be between 1,500 and 5,000 hours. The hydrodynamics of a number of porous support materials and structures were evaluated. (Carstea-USGS)
W70-04086

THE SECONDARY REFRIGERANT FREEZING PROCESS: A MATHEMATICAL STUDY,
Research Triangle Inst., Durham, N.C.
John C. Orcutt, Forest O. Mixon, and Francis J. Hale.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC - Price $1.25. Office Saline Water Research and Development Progress Report No 365, July 1968. 158 p, 23 fig, 11 tab, 40 ref, 6 append. OSW Contract No14-01-0001-960.

Descriptors: *Desalination processes, *Mathematical models, *Freezing, Economics, Analog computers, Crystal growth, Pilot plants, Temperature, Operating costs, Operation and maintenance, Columns, Optimization.
Identifiers: *Secondary refrigerant freezing process.

Mathematical models of the major system components were used to describe the secondary refrigerant freezing desalination process. The operational-design economics of a freezing process and the prediction of the best operating conditions were studied by mathematical equations with the aid of computers. The mixing characteristics of the freezer and the formation of crystals were studied in pilot plant experiments. A mathematical model for wash column operation was made with the aid of laboratory experiments on a small, rectangular wash column. Process operation economics were largely dependent upon the temperature maintained in the freezer and the overall difference in refrigerant and equilibrium temperature. The analog computer substantiated the findings of the dynamic analysis of the freezer. (Carstea-USGS)
W70-04088

THE FREEZING PROCESSES: BUTANE HYDRATES AND ANISOTROPIC POROUS MEDIA,
Syracuse Univ., N.Y.
Allen J. Barduhn, Olivier S. Rouher, and Daniel J. Fontugne.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC - Price $0.30. Office Saline Water Research and Development Progress Report No 366, p 1-15, Oct 1968. 15 p, 3 fig, 6 tab, 11 ref. OSW Grant No 14-01-0001-1135.

Descriptors: *Freezing, *Hydrate processes, *Desalination processes, Porous media, Hydrates, Permeability, Salts, Temperature, Thermodynamic behavior.
Identifiers: *Butane hydrates.

N-butane does not form a hydrate by itself at atmospheric pressures. The phase diagram for pure iso-butane hydrate shows the critical decomposition conditions to be 1.88 deg C and 1256 mm. The other thermodynamic properties studied were the heat of formation, the depression of the formation temperatures by salt, and the hydrate composition. The hydrate-forming capabilities of mixtures of iso and normal butane were determined. The design, construction and testing of an improved device for determining permeabilities of porous beds in two directions are discussed. (Carstea-USGS)
W70-04089

DEVELOPMENT OF ULTRATHIN SKIN MEMBRANES-HEMA POLYMERS,
Massachusetts Inst. of Tech., Cambridge.
A. S. Hoffman, and M. Modell.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $0.55. Office Saline Water Research and Development Progress Report No 374, Dec 1968. 30 p, 10 fig, 8 tab, 13 ref. OSW Grant No 14-01-0001-1256.

Descriptors: *Reverse osmosis, *Desalination processes, *Membranes, Sorption, Membrane processes, Water transfer, Diffusion, Diffusivity, Permeability.
Identifiers: Desalination membranes, N-methylol acrylamide, Acrylic acid, Ethyl acrylate, Trimethylol propane.

A new class of desalination membranes has been developed, characterized and tested under reverse osmosis conditions. Prepared by polymerizing mixtures of N-methylol acrylamide, acrylic acid, ethyl acrylate and trimethylol propane trimethacrylate followed by heat treatment, the membranes are essentially homogeneous, averaging about 6 mills in thickness. The membranes were characterized by measuring their sorption of water and salt when immersed in salt solution at ambient conditions. Reverse osmosis performance was evaluated at various pressures and salt concentrations. Best results indicate performance capabilities slightly better than dense cellulose acetate (39.8% acetylated) under comparable conditions. Salt and water transport mechanisms are interpreted in terms of solution at the membrane interface followed by activated diffusion of primary water or secondary water and its salt through the membrane. In terms of this model, certain changes in membrane composition or heat treatment cause much sharper drops in salt and secondary water diffusivities. This analysis permits prediction of new membrane compositions which should exhibit higher fluxes and even better permselectivity to water over salt. (Carstea-USGS)

DESALINATION BY FREEZING - AN INVESTIGATION OF ICE PRODUCTION FROM BRINE IN A CONTINUOUS CRYSTALLIZER,
Massachusetts Inst. of Tech., Cambridge.
T. K. Sherwood, P. L. T. Brian, and A. F. Sarofim.
Available from Superintendent of Documents, U S Government Printing Office, Wash, D C - Price $1.25 per copy. Office of Saline Water Research and Development Progress Report No. 474, Sept 1969. 145 p, 27 fig, 9 tab, 60 ref, 5 append. OSW Grants Nos 14-01-0001-546, 14-01-0001-1719.

Descriptors: *Desalination processes, *Freezing, *Crystal growth, *Ice, Brines, Instrumentation, Permeability, Slurries, Particle size, Particle shape, Heat transfer, Nucleation, Porosity.
Identifiers: Continuous crystallizer, Ice beds.

Crystallizer operation and the suitability of the ice product for washing to remove brine in an ice-piston wash column desalination process were investigated. The permeability of ice beds formed from the ice slurries was measured. The ice particles have a disk-like shape with a thickness-to-diameter ratio of about 0.34. Most of the ice particles have a diameter between 0.6 and 0.8 mm, with

very few particles smaller than 0.4 mm or larger than 2 mm. The principal thermodynamic loss in freezing is due to the temperature difference required to transfer heat from brine to refrigerant. Permeabilities of ice beds formed from the product slurries increased sharply with bed porosity. Somewhat higher permeabilities were found at the highest slurry densities. Population balance, growth rates and nucleation rates of ice particles are also discussed. (Carstea-USGS)
W70-04346

3B. Water Yield Improvement

HYDROLOGICAL DOCUMENTATION FOR THE EXPLOITATION OF RESERVOIRS IN PERMEABLE SOLID ROCKS FOR THE PURPOSE OF ARTIFICIAL INFILTRATION,
Hydraulic Research Inst., Prague (Czechoslovakia).
Vaclav Zajicek.
Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 124-131, 1967. 8 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Hydrologic data, *Surveys, *Data collections, *Reservoir design, *Reservoir leakage, Water storage, Aquifers, Aquifcludes, Artesian wells, Water yield, Groundwater movement, Reservoirs, Dams, Surface-groundwater relationships.
Identifiers: Czechoslovakia.

An approach to choosing valley sites for storage reservoirs is outlined. In the representative area of Czechoslovakia a dense network of hydrogeological probes was developed covering an area of several square kilometers, to study the permeable layer and its discharge in large springs at defects in the artesian ceiling. Other hydrological surveys supply data on the direction and velocity of flow, on the filtration and storage capacity of the rocks, and also on their effect on the water quality. This proves the feasibility of dual storage with the construction of impounding reservoirs and other similar reservoirs in the infiltration zone of some aquifers if the filtration losses appear as a positive item in the budget of artesian aquifers. A combination of surface and underground storage has a favorable effect also from the point of view of evaporation. (Knapp-USGS)
W70-04118

THE STORAGE CAPACITY IN THE DUNE-WATER CATCHMENT AREA OF AMSTERDAM AND ITS EFFECT ON THE WATER QUALITY,
Municipal Waterworks of Amsterdam (Netherlands).
K. D. Venhuizen.
Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 109-123, 1967. 15 p, 2 fig, 10 chart, 1 tab.

Descriptors: *Recharge, *Sands, *Water yield, *Water quality, Aquifers, Dunes, Water table, Canals, Drainage, Water levels, Water-level fluctuations, Saline water intrusion, Water storage, Induced infiltration, Surface-groundwater relationships.
Identifiers: *Netherlands.

The dunewater catchment area of Amsterdam is situated south of Zandvoort and covers approximately 3650 ha. Extraction of water was started in 1853 by means of open canals, and later by means of wells. By 1915 the amount of the extraction equaled the total effective rainfall. After that more water was extracted than percolated in the area. Since 1957 part of this area has been recharged with prefiltered water from the River Rhine, transported by a pipeline with a total length of 53 km. The infiltration water is captured by means of horizontal drains which carry it to the open canals. At present the infiltration area is about 430 ha and the capacity is 70 million cu m a year. In another part of the dunes storage canals have been built with a total storage capacity of 10 million cu m. The infiltration area combined with the storage capacity and the well-system have a probable aggregate capacity at 82 million cu m a year. By mixing the types of water it is possible to influence the quality of the final product. (Knapp-USGS)

SAGEBRUSH CONVERSION TO GRASSLAND AS AFFECTED BY PRECIPITATION, SOIL, AND CULTURAL PRACTICES,
Geological Survey, Denver, Colo. Water Resources Div.
L. M. Shown, R. F. Miller, and F. A. Branson.
Journal of Range Management, Vol 22, No 5, p 303-311, Sept 1969. 9 p, 5 fig, 2 tab, 14 ref.

Descriptors: *Range management, *Land management, *Revegetation, *Vegetation establishment, *Sagebrush, Watershed management, Cultivation, Grasses, Grazing, Forages, Range grasses, Brush control, Vegetation regrowth.
Identifiers: Sagebrush conversion, Grass establishment.

The most successful conversions of sagebrush to crested wheatgrass, in areas of the Western United States that receive an average of 8 to 14 inches of precipitation annually, usually occur where the annual precipitation exceeds 10 inches and on soils having medium moisture-holding capacities. Conversion results were intermediate on coarse soils having low moisture-holding capacities and comparatively poor on fine soils having high moisture-holding capacities. Degree of grass establishment varied directly with the big sagebrush vigor-index. Grass production was lower on gravelly sites converted from black sagebrush than on nearby sites converted from big sagebrush. Cheatgrass hindered the establishment of crested wheatgrass in some places. Conversion results were poor on sites where greasewood or shadscale was mixed with sagebrush. These halophytes had usually reestablished on the treated sites. (Knapp-USGS)

3D. Conservation in Domestic and Municipal Use

COOPERATION BY CITIES OF 100,000 INHABITANTS AND MORE WITH DRAINAGE DISTRICTS, ETC., FOR FLOOD PROTECTION.

Mo Ann Stat secs 70.330 thry 70.360 (1952).

Descriptors: *Missouri, *Cities, *Drainage districts, *Sewers, Legislation, Local governments, Watershed management, Flood control, Watersheds (Basins), Punlic health, Environmental sanitation, Conveyance structures, Natural streams, Overflow, Flood damage, Eminent domain, Right-of-way, Assessments, Cost-benefit theory, Costs, Cost repayment, Stream improvement, Cost allocation, Levees, Construction.

Cities with more than one hundred thousand inhabitants amy contract with local drainage districts or other public corporations for cooperation or joint action in building sanitary and storm sewers in watersheds common to such cities and districts. These cities may also contract to construct levees or improve any natural watercourse to prevent overflow from injuring lands situated within their territorial limits. These cities may contract with the United States, private corporations, and any individuals owing lands subject to injury by overflow or in need of sewers. Where a watershed is located partially within an adjoining state, the preceeding activities may be carried on with the consent of the adjoining state if the public health and safety so require. These cities may acquire rights of way by purchase or eminent domain for any such sewers or watercourse improvements. The cities may pay for these works and rights of way out of their general funds or by imposition of special assessments upon benefited lands. (Schram-Florida)
W70-04230

MUNICIPALLY OWNED UTILITIES: CITIES SUPPLIED WITH WATER FROM OTHER CITIES.
Mo Ann Stat secs 91.050 thru 91.080 (1952).

Descriptors: *Missouri, *Water works, *Water supply, *Local governments, Public utilities, Pipelines, Water delivery, Contracts, Condemnation, Eminent domain, Condemnation value, Easements, Right-of-way, Water distribution (Applied), Cities.

Any city in the state which owns and operates a waterworks system may supply water to other municipalities and to persons beyond the corporate limits of the city. Any city having authority to maintain waterworks may procure water from another city for that purpose and may lay pipelines and install all machinery needed to convey the water from the supplying city. Every city to be supplied with water from another city may condemn a right of way to and from the supplying city. (Dearing-Florida)

WATER UTILITY COST TRENDS,
Dade County Water and Sewer Board, North Miami Beach, Fla.; Whitman, Requardt and Associates, Baltimore, Md.; and Cast Bay Municipal Utility District, Oakland, Calif.
Stanley L. Cohen, C. Ernest North, and Charles B. Adelman.
American Water Works Association Journal, Vol 60, No 2, p 129-134, February 1968. 6p, 2 ref.

Descriptors: *Costs, *Interest rates, *Financing, Inflation, Wages, Water supply, Budgeting, Fringe benefits, Labor, Investment, Management, Water rates, Profits, Debt, Industrial production, Population.
Identifiers: *Depreciation, *Trending method.

Three basic topics are discussed, the first being the interest rate costs in water utilities. The need for large amounts of capital for water treatment and supply facilities is stressed as well as the increasing cost of that capital. The dilemma that this poses to the water utility faced with artificially low water rates is discussed. The second section is concerned with depreciation and the problem of estimating depreciation with respect to the true purpose of depreciation, (i.e., to recover the original investment). The method currently in use is poor and the article proposes the trending method as producing better results. The third section deals with the cost of labor and material in water utilities. This final section discusses the rising cost of labor, the use of indexes, the cost effects of fringe benefits and the implications of inflation for water costs. (Murphy-Rutgers)

MUNICIPALLY OWNED UTILITIES: WATERWORKS.
Mo Ann Stat secs 91.593 thru 91.610 (1952).

Descriptors: *Missouri, *Water works, *Public utilities, *Local governments, Pipes, Buildings, Easements, Right-of-way, Condemnation, Condemnation value, Eminent domain, Water supply, Municipal water, Financing, Pumping plants, Compensation, Water distribution (Applied), Distribution systems, Contracts, Land tenure, Legislation.
Identifiers: *Revenue bonds.

Certain cities which own and operate a waterworks system may acquire and maintain property and facilities outside the city limits when necessary for connecting with emergency water supplies or for furnishing water to persons outside the city limits. These cities may issue revenue bonds, following specified procedures, for the repair or improvement of their waterworks systems. Every such city may take, hold, use, and dispose of real and personal property as necessary to provide waterworks for the city. No property may be taken or damaged, however, without payment of just compensation to the owner. (Dearing-Florida)

3E. Conservation in Industry

GEOLOGICAL SURVEYS AND WATER RESOURCES; GEODETIC SURVEYS.

Mo Ann Stat secs 256.010 thru 256.160 (1959), as amended, (Supp 1970).

Descriptors: *Missouri, *Geological surveys, *Water resources, *Administrative agencies, Groundwater, Mineralogy, Compensation, Costs, Federal government, Clays, Rocks, Natural gas, Maps, Conservation, Construction, Education, Damages, Water supply, Subsurface waters, Chemical analysis, Surface waters, Supervisory control (Power), Water resources development.
Identifiers: Penalties (Civil).

The Governor is authorized to appoint a competent state geologist to direct a geological survey. The state geologist may appoint assistants to make a thorough scientific, geological, and mineralogical study of the state. The Governor shall have general supervisory control of the Division of Geological Survey and Water Resources. All employees of the Division shall abstain from private consulting activities. Priorities in the Survey include studies of geological formations, mineral deposits, and the arrangement, composition and utilization of ores, clays, natural gas, surface and groundwaters, and other mineral substances. The state geologist is directed to prepare statistical reports and topographical maps, and to apply geologic engineering principles to problems of agriculture, conservation, and construction. He is also authorized to make a survey of the state's water resources. Information gathered shall be made available to the news media and educational institutions. The Division may authorize additional technical work, and may cooperate with federal agencies. Geodetic surveyors may enter state lands to effect the objects of the federal act. Compensation is to be paid for damages done by surveyors and procedures are set forth for determining adequate compensation. (Duss-Florida)
W70-04228

POWERS OF GAS, ELECTRIC OR WATER COMPANIES.

Mo Ann Stat secs 393.010 thru 393.030, 303.050 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Public utilities, *Electric power industry, *Water works, Legal aspects, Legislation, Cities, Industries, Water distribution (Applied), Urbanization, Utilities, Condemnation, Eminent domain, Construction, Electric power production, Right-of-way, Water conveyance, Water delivery, Consumptive use, Distribution systems, Water allocation (Policy).

Corporations organized to supply gas, electricity or water are authorized to set their poles, piers, abutments, wires and other fixtures along, across, or under any Missouri waters in such a manner as not to incommode the public use of such waters. Such corporations are authorized to lay and construct underground water mains across any Missouri streams for the purpose of furnishing water supply. Any corporation, company or individual proposing to supply any city, town, or village with water is authorized to take water from any non-navigable stream and to erect a dam thereon. Any such water corporation may acquire by condemnation sufficient lands to lay pipes for the conveyance of water in, over, or through lands situated beyond the water supply source. Any such water corporation may also acquire by condemnation sufficient lands upon which to drill wells to provide an adequate water supply from underground sources. Sufficient lands upon which to build, construct, install and operate facilities for the processing, pumping, storage distribution and water management may be acquired by condemnation. IMPROVING EFFICIENCY IN AGRICULTURAL WATER USE,
Colorado State Univ., Fort Collins. Natural Resources Center.
W. Doral Kemper, and R. E. Danielson.
Available from the Clearinghouse as PB-189 784, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 5 p, 9 ref. OWRR Project A-002-COLO.

Descriptors: *Water conservation, *Microwatershed, *Irrigation effects, *Moisture stress, *Runoff management, Water management, Evapotranspiration, Crop response, Growth rates, Moisture uptake, Water yield.

Management of runoff under dry land cropping was attempted by collecting precipitation from sealed surfaces 4 ft. to 10 ft. wide on untreated crop strips 18 in. wide. In the dry years of 1966 and 1968, when only six and eight inches of water were avaiable, respectively, (soil storage plus rainfall) yields from microwatersheds were five times yields on untreated check areas. Crops grown included corn, sugar beets, and sweet corn. During the four-year study period, 1967-1969, with an average of 8.5 in. of moisture available, corn on the treated plots yielded 68 bushels per acre compared to 32 bushels per acre from the untreated area. In 1968 when 8 in. of moisture was available, sweet corn on microwatersheds yielded 924 ears per acre compared to 165 ears per acre from the check. Sugar beets yielded 9 tons per acre compared to 3 tons per acre on the check. In 1967 with 11 in. of moisture available, beets on the microwatersheds yielded 12 tons per acre compared to 11 tons per acre on the check. An evaluation of several possible waterproofing or infiltration reducing covers for the microwatersheds were made. Controlling water stress by irrigation scheduling reduced evaporation 61 percent while yields were reduced only 36 percent compared to maximum yields under ideal moisture stress conditions.

AN EVALUATION OF RANGE FLOODWATER SPREADERS,
Geological Survey, Denver, Colo. Water Resources Div.
R. F. Miller, I. S. McQueen, F. A. Branson, L. M. Shown, and Wm. Buller.
Journal of Range Management, Vol 22, No 4, p 246-257, July 1969. 12 p, 14 fig, 1 tab, 22 ref.

Descriptors: *Range management, *Water spreading, *Flood irrigation, Recharge, Erosion, Erosion control, Vegetation effects, Drainage, Water storage, Water yield, Flood control, Hydrographs.
Identifiers: Floodwater spreading.

Range floodwater spreaders are systems of dikes constructed to automatically divert floodflows from gullies and spread them over adjacent range land. The primary purpose of the investigation was to determine what factors influence vegetal response to this supplemental moisture. Forage was established and produced only on sites that received at least one flooding per year. Forage production per unit of water was less when water was ponded and could not drain completely from the soil surface. The total moisture retention capacity of the A and B horizons had more influence than soil texture on the amount of forage produced. (Knapp-USGS)
W70-04324

PASTURE IMPROVEMENT IN THE DESERT ZONES OF UZBEKISTAN,
National Science Foundation, Washington, D.C. Special Foreign Currency Science Information Program.
L. Gaevskaya, Z. Shamsutdinov, and M. Sosnina.
Translation of Uluchsheni E Pastbishch i Sozdanie Senokosov v Pustynnoi Zone Vzbekistana. Available from the Clearinghouse as TT 69-55076. Israel Program for Scientific Translations, Catalog No. 5508; Jerusalem, 1969. 49 p, 26 fig, 4 tab, 38 ref.

Descriptors: *Arid lands, *Pasture management, *Sheep, *Grazing, *Forages, Plant pathology, Browse utilization, Range management, Deserts, Rotations, Seeds, Pest control.
Identifiers: *Uzbekistan, USSR.

Sparse forage vegetation is a major problem in the arid-land sheep pastures of Soviet Central Asia. This situation is often aggravated by either undergrazing or overgrazing the range. In an attempt to relieve the forage problem, measures were introduced utilizing plant pest and disease control, more efficient grazing systems, short- and long-term pasture improvement, and dry-land fodder production. The effects of each of these programs is discussed, but no overall conclusions are drawn. (Carr-Arizona)

TRANSPIRATION, EVAPORATION AND DEEP DRAINAGE LOSSES FROM AN ORANGE PLANTATION,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
J. D. Kalma, and G. Stanhill.
Israel Journal of Agricultural Research, Vol 19, No 1, p 11-24, January 1969. 3 fig, 3 tab, 23 ref.

Descriptors: *Semiarid climates, *Evaporation, *Irrigation practices, *Drainage effects, *Evapotranspiration, Irrigation water, Precipitation (Atmospheric), Deep percolation, Orchards, Oranges, Water loss, Sprinkler irrigation, Soil water, Moisture content, Canopy, Throughfall, Water balance, Soil surfaces, Measurement, On-site data collections, Evaporation pans.
Identifiers: *Israel.

A mature orange orchard on the Israeli coastal plain was the site of an intensive one-year study of water loss. Total water income amounted to 569 mm of precipitation and 483 mm of irrigation water. Total water loss consisted of 206 mm of deep drainage and 850 mm of evapotranspiration. Of this latter, 217 mm (26%) was evaporation from the bare soil. It was calculated that if an above-canopy sprinkler system were substituted for the current below-canopy type, total annual water loss would increase by 44 mm. A subsurface irrigation method would decrease water loss by leaving the upper soil layer dry. The estimated reduction of evaporation amounted to 32 mm. (Carr-Arizona)

A WORLD GEOGRAPHY OF IRRIGATION,
Leonard M. Cantor.
Praeger Publishers, New York, Washington, 1970, 252 p, 60 fig, 41 plates, 158 refs, Index.

Descriptors: *Irrigation, *Agriculture, *Arid lands, *Economic impact, *Social aspects, Semiarid climates, Surface waters, Groundwater, Water supply, Irrigation practices, History, United States.
Identifiers: *Geography, Asia, Africa, Latin America, USSR, Europe, Southwest Asia, Australia.

Although irrigated areas of the world have nearly doubled in 20 years, agricultural production has not risen correspondingly. This partly owing to complex social, physical, economic and geographic factors. This book provides the student of geography with a broad picture of irrigated agriculture throughout the world. Although most of the work is concerned with irrigation in arid or semiarid climates, it also reviews supplemental irrigation practices in such areas as monsoon Asia and western Europe. The first section of the volume is devoted to the history of irrigation and its social and economic aspects. The second part reviews the development and current practices of irrigation in each geographic region of the world. (Crouse-Arizona)

EFFECT OF THE PRECEEDING CROP AND AGRONOMIC PRACTICE ON SORGHUM (SORGHUM BICOLOR L. MOENCH) AND GROUNDNUTS (ARACHIS HYPOGAEA L.) IN THE CENTRAL SUDAN,
Agricultural Research Service, Athens (Greece).
P. A. Gerakis, and C. Z. Tsangarakis.
Agronomy Journal, Vol 61, No 5, p 681-683, September-October, 1969. 4 tab.

Descriptors: *Sorghum, *Rotations, *Semi-arid climates, *Fallowing, *Soil moisture, Crop production, Fertilizers, Nitrogen.
Identifiers: *Central Sudan, *Bare fallow, *Groundnuts.

In order to devise an improved rotation policy, an experiment was conducted in the Central Sudan to study effect of previous cultivation on the subsequent sorghum and peanut crop. The use of bare fallow the first year in order to increase soil moisture for the second was also investigated. Except for the top 0.15 meters of soil, soil moisture was significantly higher in bare fallow as compared to weed fallow plots. Moisture increase was not reflected in the yield of either crop. This should not preclude further experimentation with the bare fallow technique, especially in the cultivation of very deep-rooted species. (Carr-Arizona)

AGRARIAN STRUCTURE IN THE PIEDMONT OASES OF TARAPACA PROVINCE (IN SPANISH),
Universidad Catolica de Valparaiso (Chile). Departamento de Geografia.
Osvaldo Ossandon.
Revista Geografica de Valparaiso Vol 1, No 1, p 41-62, 1967. 3 fig, 3 tab, 14 ref.

Descriptors: *Land tenure, *Arid lands, *Agriculture, *Social Impact, *Economic Impact, Horticultural crops, Irrigation.
Identifiers: *Tarapaca Province, *Chile, *Oases.

This contribution is part of a regional analysis of Chile's arid Norte Grande which when completed, will give a scientific basis for regional plans and local research in order to utilize to the best possible degree valuable resources or alternate means in areas where lack of resources is an impediment to development. History of land ownership, extent of cultivation, number of ranches and availability of water are discussed at length. One oasis village--Matilla-- is treated in depth, indicating agricultural production, irrigation and problems resulting from continued partioning of land into increasingly smaller parcels. (Moore-Arizona)

SETTLEMENTS NEAR THE ARID MARGIN OF CULTIVATION, NORTHEAST AFRICA (IN GERMAN),
Martin Born.
English Summary. Geographische Zeitschrift, Vol 55, No 4, p 243-278, 1967. 9 maps, 36 refs.

Descriptors: *Arid lands, *Flash floods, *Flood irrigation, *Impoundments, Cotton, Dry farming, Dunes, Forages, Irrigation, Irrigation practices.
Identifiers: *Nomads, *Red Sea Hills, Sudan.

Expansion of cropland in the marginal land adjacent to the very arid portions of East Africa, among the Red Sea Hills, has had a marked effect on the nomads of the area. Cultivation of such areas is dependent on accommodation to a rainfall of less than 200 mm through devices for impoundment of surface water and flood irrigation. The camel-owning tribes of this region are less nomadic than other Sudan tribes, and practice a limited type of agriculture, mostly cotton and forages. As the degree of aridity increases, agricultural development becomes more restricted. Attempts to control flash floods are less than successful, and uncertain rainfall creates a situation unsuited to any more intensive type of farming. Yet the pressures of population, both human and herds, cannot be solved without greater attention to either severely limited numerical control of both, or a more highly sophisticated attack on the technological problems of an exceedingly stressful environment, or both. (Paylore-Arizona)
W70-04411

KHARGA, FROM THE OASIS MAGNA TO THE NEW VALLEY (IN GERMAN),
Heinz Schamp.
Summary in English. Die Erde, Vol 98, No 3, p 173-202, 1967. 1 fig, 54 refs.

Descriptors: *Irrigation, *Deserts, *Water resources development, *Groundwater basins, *Deep-well pumping, Wells, Land resources, Community development, Economic impact, Social aspects, Soil profiles, Arid lands, Water sources, Arable land.
Identifiers: *Oases, *Kharga Oasis, Egypt.

Kharga, one of the largest of the Egyptian oases, was included in the area of the Western Desert selected by Egyptian Government's General Desert Development Organization for land reclamation and resettlement. The first 5-year program (1960-1965) provided approximately 100 deep wells, furnishing irrigation water for the cultivation of some 45,000 feddans (1 feddan = 1.04 acres) as compared with only 6,000 formerly. Although the origin of the groundwater in the Kharga oasis area is not yet identified, current estimates from known supplies indicate that even larger acreage may be brought under cultivation. Topics discussed include groundwater, soils, a history of the oasis detailing recurring desertification, the cost of financing the New Valley project, and settlement problems. The latter topic seeks to compare the old oasis villages with the new settlements, characterized by an influx of new population types: technicians, engineers, and the like. The extreme desertic conditions of the surrounding environment make the Kharga Oasis development one of great general interest, since its success could provide a pilot for similar water-short areas throughout the arid world. The element of its water potential is the critical factor. (Paylore-Arizona)

SOLAR BATTERIES AND AGROECONOMY OF DEVELOPING NATIONS,
Jadavpur Univ., Calcutta (India). Dept. of Electronics and Telecommunication Engineering.
S. Deb, and M. K. Mukherjee.
Indian Journal of Scientific and Industrial Research, Vol 28, No 3, p 81-84, March 1969. 2 tab, 23 ref.

Descriptors: *Irrigation, *Irrigation engineering, *Solar radiation, *Electric power production, *Electric power costs, Irrigation wells, Electric power, Arid lands, Semiarid climates, Agriculture, Economic impact, Energy, Generators, Costs.
Identifiers: *Solar batteries, *Deep-tube wells, India.

Use of solar energy for generating electrical power is of great interest to areas in which there is abundant sunlight but scanty water supply. Irrigation using conventional methods of power generation has some associated difficulties from which solar power would be free. Unfortunately, present solar cells are expensive and incapable of uniform output. The probable details and cost were worked out for a solar battery capable of operating a deep-tube well for irrigation. If present research is able to reduce the cost of solar cells, savings of up to 50% would be possible when compared with conventional power. Considering the importance of irrigation to the economies of developing nations, further research in this field should be encouraged. (Carr-Arizona)
W70-04413

SPRINKLERS AND VEGETABLE CROP MECHANIZATION IN DESERT AREAS,
California Univ., Riverside. Agricultural Extension Service.
Hunter Johnson, Jr., Albert W. Marsh, G. Neil McRae, and Phillip G. Mowbray.
Agricultural Engineering, Vol 51, No 1, p 20-21, January 1970. 1 fig.

Descriptors: *Sprinkler irrigation, *Crop production, *Seeds, *Saline soils, *Vegetable crops, Salt tolerance, Germination, Arid lands, Deserts, Irrigation systems, Furrow irrigation, Temperature, Irrigation efficiency.
Identifiers: *Cabbage, Romaine, Precision planting.

Sprinkler irrigation substantially improves germination and emergence of romaine and cabbage seed. The results are attributed to seed salt zone control. Sprinkler plots were found to have conductivities of from 3 to 4 mmhos in the top inch of soil, compared to 15 to 20 mmhos for furrow-irrigated plots. These findings indicate that precision planting on saline soils could be practical. Sprinklers would be the first step in mechanized culture of vegetable crops, especially in desert areas. (Carr-Arizona)
W70-04415

SPRINKLER FERTILIZATION AND PLANT DAMAGE,
Agricultural Research Service, Kimberly, Idaho. Snake River Research Center; and Idaho Univ., Moscow. Agricultural Experiment Station.
C. L. Douglas, Claude H. Pair, and J. Hamilton Smith.
Agricultural Engineering, Vol 50, No 11, p 687, November 1969. 1 fig.

Descriptors: *Fertilization, *Application methods, *Crop response, *Sprinkler irrigation, *Damages, Crop production, Ammonium compounds, Ureas, Potatoes, Sugar beets, Wheat, Spraying, Fertilizers.
Identifiers: *Plant damage.

Fertilizing plants by sprinkler irrigation is simple and rapid. Unfortunately there is the possibility of high fertilizer concentrations damaging the plant unless fertilizer is rinsed from the leaves. Potatoes, sugar beets, and Lemhi wheat were grown in order to determine safe concentrations of sprinkler - applied fertilizer. Plants were fertilized weekly with ammonium nitrate or ammonium nitrate and urea. Potatoes showed no sign of damage up to 1500 ppm with ammonium nitrate and up to 2000 ppm with nitrate and urea (these were the maximum amounts tested). Sugar beets and wheat also showed no sign of damage up to the limits of the experiment, 2000 ppm of ammonium nitrate. Although these were greenhouse tests, they do indicate that a farmer could sprinkler fertilize at almost any economical rate without damage to his crop. (Carr - Arizona)

WISCONSIN'S FLOOD PLAIN MANAGEMENT PROGRAM.
Wisconsin Dept. of Resource Development, Madison.

Madison: State of Wisconsin, Department of Natural Resources, Nov 1967. 29 p.

Descriptors: *Wisconsin, *Management, *Flood plains, *Regulation, Flood control, Flood protection, Flood forecasting, Flood damage, Flood plain insurance, Flood plain zoning, Floodways, Non-structural alternatives, Floods, Floodproofing.
Identifiers: *Flood plain management.

This flood plain management program consists basically of three parts: (1) evaluation of the flood-

ng potential and identification of the flood plains by using criteria established herein by the Division of Resource Development, (2) formulation, administration and enforcement of reasonable regulations and other flood plain management practices which are based on sound technical data and consistent with state criteria and comprehensive community land use needs, and (3) continuous review and upgrading of flood plain management criteria and regulations based on new hydrologic, hydraulic and other technical information and methods. In addition to a statement of policies and procedures, a number of criteria used to evaluate flood plain regulations. Criteria applying to the following aspects of flood plain regulation were discussed: purposes and objectives, regional flood, flood plain delineation, floodway determination and delineation, regulatory flood protection elevations, floodway encroachments, areas between floodway or encroachment limits and levees, areas landward of floodway or encroachment limits, flood proofing measures, flood protective or control works, modifications or additions to existing structures, removal of designated flood plain limits, certifications of compliance and public information. FLOOD-HAZARD MAPPING IN METROPOLITAN CHICAGO,
John R. Sheaffer, Davis W. Ellis, and Andrew H. Spieker.
Available free from the US Geological Survey, Wash, DC, 20242. US Department of the Interior, US Geological Survey, USGS Circular 601-C, 1970. 14 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Cities, *City planning, *Flood plains, *Land use, Storm runoff, Utilities, Urbanization, Flooding, Flood plain insurance, Flood plain zoning, Floodproofing, Floods, Floodways, Flood forecasting, Land management, Land classification, Public lands.
Identifiers: *Chicago, *Flood plain information, *Flood-hazard mapping, *Flood plain management, Crest-stage gaging network.

The effective management of flood plains consists of more than building detention reservoirs and levees. As urban pressures are forcing more and more developments on flood plains, such devices as flood-plain regulations and floodproofing are coming into wider use. These devices require information as to what areas are likely to be flooded. Flood-hazard mapping is such a means of providing flood plain information for planning and management programs. Proper use of flood-hazard mapping will help to: (1) prevent improper land development in flood plain areas; (2) restrict uses that would be hazardous to health and welfare and which would lead to undue claims upon public agencies for remedy; (3) encourage adequate stream channel cross-section maintenance; (4) protect prospective home buyers from locating in flood-prone areas; (5) preserve potential for natural groundwater recharge during flood events; (6) guide the purchase of public open space; and (7) avoid water pollution resulting from the flooding of sewage treatment plants and solid waste disposal sites that were located on flood plains. The implementation of the flood-hazard mapping program in the Chicago area, including the establishment of a crest-stage gaging network is discussed. Examples of the usefulness of flood-hazard maps in urban development are presented, including regulation of private development, purchase of property for public use, development of public facilities and planning guidelines for future development. WISE USE OF FLOOD PLAINS.

Wise Use of Flood Plains, New England River Basins Comm'n, p 1-34, July 1969. 34 p.

Descriptors: *New England, *Flood protection, *River basin development, *Flood control, Flood plains, Channel improvement, Dams, Flood forecasting, Floodproofing, Levees, Warning systems, Historic flood, Flood plain zoning, Rivers, Streams, Floods, Legislation, State governments, Administration, Federal government, Planning, Permits, Legal aspects.

A general survey is made of the reasons for flood damage to property and the results of previous attempts to lessen this damage. A summary is given of measures presently being employed by state governments to prevent flood damage and soften the effects of injuries which are not preventable. Methods of flood control are divided into preventive and corrective measures. State programs in Connecticut, Maine, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont are described, together with federal programs for flood control. Particular emphasis is placed upon the Report of the Task Force on Federal Flood Control Policy of 1966. The study concludes with recommendations to the federal and state governments of means by which flood losses may be reduced throughout the United States. The recommendations discourage the development of property in areas susceptible to flooding. (See also W70-04214 thru W70-04217). (Dye-Florida)
W70-04213

WISE USE OF FLOOD PLAINS (FLOOD PLAINS).
Wise Use of Flood Plains, New England River Basin Comm'n, p 1-4, July 1969. 4 p.

Descriptors: *New England, *Flood plains, *Flood protection, *Flood damage, Flood control, Legal aspects, Dams, Flood forecasting, Floodproofing, Levees, River basin development, Warning systems, Water management (Applied), Flood plain insurance, Flood plain zoning, Streams, Floods.

Flood damage occurs when areas susceptible to flooding are developed for economic purposes. Though most such areas have had some historical flood problems, severe floods are infrequent and development eventually proceeds despite the danger of flood damage. The increasing urbanization and industrialization of society also contributes to development of areas along the seacoast and larger streams. Thus, despite heavy government expenditures for flood prevention and protection, yearly flood damage rises. The flood plain is a reserve area carved out by a watercourse to hold surplus water in times of flood. A simple solution to flood damage problems is to impede development of flood plains. Needs for railways, highways, hydro-electric plants, and dock facilities make this solution difficult to implement. A diagram shows methods of flood damage prevention, dividing them into corrective and preventive measures. Possible corrective measures include dams and reservoirs, levees, channel improvements, evacuation forecasting, and urban redevelopment. Preventive measures include zoning, building codes, development policies, warning signs, and insurance. (See W70-04213). (Dye-Florida)

Wise Use of Flood Plains, New England River Basin Comm'n, p 5-14, July 1969. 10 p.

Descriptors: *New England, *Flood plain zoning, *Flood control, *Flood protection, Legislation, Legal aspects, River basin development, Water management (Applied), Water policy, Flood plains, Rivers, Streams, Floods, State governments, Administration, Planning, Permits, Administrative agencies.

Following extremely severe flood damage in 1955, Connecticut enacted the Stream Encroachment Law which empowers a Water Resources Commission to establish enroachment lines along waterways and flood-prone areas. Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont have passed zoning enabling acts, allowing municipalities to zone flood plains for low-damage uses. Maine's executive agencies must consider potential flood damage in planning state-supported land development. Massachusetts has empowered the Department of Natural Resources to restrict urban development in areas of high flood danger; however, when a landowner objects to these restrictions on the development of his land, the Department must withdraw the restrictions or purchase the land. New Hampshire, New York, and Vermont are considering plans for flood control. Rhode Island has enacted zoning regulations which take into account the susceptibility of land to flooding. (See W70-04213). (Dye-Florida)

WISE USE OF FLOOD PLAINS (FEDERAL FLOOD CONTROL POLICY).
Wise Use of Flood Plains, New England River Basin Comm'n, p 14-29, July 1969. 16 p.

Descriptors: *Federal government, *Flood plains, *Flood control, *Administration, Administrative agencies, Project planning, Flood protection, Flood damage, Flood forecasting, Flood proofing, River basin development, Warning systems, Flood plain zoning, Floods, Legal aspects.

The Task Force on Federal Flood Control Policy was appointed to report on the causes of flood damage and applicable solutions. The Task Force recommended that the federal government undertake the following: (1) improvement of the knowledge of flood hazards, (2) coordination of plans for development of flood plains, (3) initiation of a program of technical information made available to flood plain managers, (4) creation of a national flood insurance plan, and (5) continued adjustment of federal flood control policy to changing needs. The Task Force made additional proposals for implementation of these major programs. The Corps of Engineers and the Soil Conservation Service should collect data on flood plains. Federally sponsored housing and assistance programs should consider the flood factor in their administration. An improved system for flood forecasting and warning should be devised. Land acquisition by government should become part of flood control policy. Federal assistance programs should be utilized to soften the effects of flood damage. (Dye-Florida)
W70-04216

WISE USE OF FLOOD PLAINS (RECOMMENDATIONS FOR WISE FLOOD PLAIN MANAGEMENT).
Wise Use of Flood Plains, New England River Basins Comm'n, p 30-34, July 1969. 5 p.

Descriptors: *Flood plains, *Administration, *Flood protection, *Flood plain zoning, Flood control, Federal government, State governments, Administrative agencies, Project planning, Flood damage, Flood forecasting, River basin development, Warning systems, Legal aspects, Cities.

Under existing laws in New England, towns and cities have the best opportunity to make wise use of

flood plains. State governments and the federal government can give some support. Each community should have a zoning code which implements its flood control policy. Each community, with the aid of federal agencies, should map areas subject to frequent flooding. Communities may condemn and purchase flood-prone lands, and federal grants may be available to aid in these purchases. Federal participation in flood plain management is limited to technical assistance to the state or local government. Each state should have a single office administering flood plain management. Executive orders should be issued to deter unwise flood plain development. State and local tax policies should encourage the continuance of present open or wetland areas. Flood forecasting and data collection should be emphasized. (Dye-Florida)
W70-04217

DRAINAGE DISTRICTS (GENERAL PROVISIONS).
Mo Ann Stat secs 242.010 thru 242.050 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Drainage districts, *Drainage engineering, *Drainage programs, Legal aspects, Drainage systems, Administration, Legislation, Swamps, Wetlands, Land reclamation, Environmental sanitation, Sanitary engineering, Public health, Public benefits, Environmental engineering, Projects, Project planning, Programs, Agricultural engineering, Conservation.

The owners of a majority of the acreage in any contiguous body of swamp, wet or overflowed lands, or lands subject to overflow may form a drainage district to reclaim and protect the lands and other property from the effects of water, for sanitary or agricultural purposes, or for public convenience, health, welfare or benefit. The procedures in forming and organizing the drainage district are prescribed. The procedure for objecting to the formation of a drainage district by an owner of real estate or other property is set forth. The annexation of land to organize the drainage district is regulated. (Powell-Florida)

NICHOLSON V HOLLOWAY PLANTING COMPANY (SERVITUDE OF DRAIN).
229 So 2d 679-697 (La 1969).

Descriptors: *Louisiana, *Water rights, *Drainage water, *Surface runoff, Judicial decisions, Legal aspects, Drainage practices, Surface waters, Water management (Applied), Easements, Preferences (Water rights), Riparian rights, Adjudication procedure, Overlying proprietor, Relative rights, Natural flow doctrine, Reasonable use, Obstruction to flow, Alteration of flow, Riparian land, Flow control, Watercourses (Legal).

Plaintiff's estate was adjacent to and north of defendant's estate. Both plantations fronted on the west side of a bayou. The predominant slope was from east to west from the bayou. Running across both properties are the remnants of numerous old crevasse channels, formed by the flood waters of the bayou. Plaintiff sought recognition of a servitude of drain in favor of his estate over defendant's adjoining property. The court held that plaintiff's estate was dominate; that channels naturally drained water from plaintiff's estate across defendant's estate; and that plaintiff's estate had a servitude of drain over defendant's estate. A controlling Louisiana Civil Code stated that lower land was legally obligated to receive surface waters which flow naturally through channels of natural origin from the adjoining dominant estate. But this included only such as would ordinarily run there in view of the land's configuration. The court also determined that a proprietor of an upper estate could make works tending to accelerate and hasten drainage of his own land beyond the natural slow process, but he could do nothing which would tend to throw upon the lower estate the burden of receiving waters which would not otherwise drain upon it. (Powell-Florida)
W70-04234

DRAINAGE DISTRICTS.
Mo Ann Stat secs 242.190, 242.210 (Legis Service No 1 1969).

Descriptors: *Missouri, *Drainage districts, *Administrative agencies, *Drainage, Legislation, Reclamation, Channel improvement, Reservoirs, Condemnation, Easements, Right-of-way, Bridges, Structures, Ditches, Levees, Land reclamation, Hydroelectric power, Hydroelectric plants, Construction, Maintenance, Electric power, Dams, Taxes, Assessments, Damages, Alteration of flow.

In order to effect the drainage, protection, and reclamation of property within the drainage district, the board of supervisors is authorized to: (1) clean out, straighten, widen, deepen, or change the course of flow of any ditch, drain, river, or watercourse; (2) fill up any creek, drain, channel, river, or watercourse; (3) concentrate, divert, or divide the flow of water in or out of the district; (4) construct and maintain ditches, canals, levees, dikes, dams, reservoirs, pumping stations and other needed improvements; and (5) construct all needed bridges, works, and improvements. The board is authorized to acquire and hold property and may condemn any needed land, easement, or right of way, reservoir, or holding basin. The board is empowered to control all water power created by the construction of works of the district and may construct and maintain hydroelectric power plants to develop such power. Any surplus power in excess of that required by the district may be leased. (Schram-Florida)
W70-04238

DRAINAGE DISTRICTS (BOARD OF SUPERVISORS).
Mo Ann Stat secs 242.060 thru 242.210 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Administration, *Drainage districts, *Drainage engineering, Legislation, Drains, Drainage systems, Drainage programs, Legal aspects, Administrative agencies, Regulation, Hydroelectric plants, Water works, Condemnation, Construction, Maintenance, Water control, Operation and maintenance, Project planning, Electric power production.

The board of supervisors for a drainage district is authorized and empowered to clean out, widen, alter, or deepen any ditch, drain, lake, or watercourse in the district. The board is authorized to fill any creek, drain, channel or watercourse; concentrate, divert, or divide the flow of water in or out of the district; and construct and maintain main and lateral ditches, canals, levees, dikes, dams, sluices, revetments, reservoirs, holding basins, floodways, pumping stations, syphons, and any other improvements deemed necessary to preserve and maintain works inside or outside of the district. The board is empowered to construct or enlarge necessary bridges. The board may purchase or condemn any land, easement, railroad right-of-way, sluice, reservoir, holding basin, or franchise in carrying out its function. The board of supervisors may control all water power created by the construction of works in the district, and has the authority to construct and maintain hydroelectric power plants. (Powell-Florida)
W70-04242

DRAINAGE DISTRICTS (ORGANIZATION).
Mo Ann Stat secs 242.220 thru 242.300 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Land reclamation, *Drainage districts, *Drainage engineering, Administration, Regulation, Legislation, Legal aspects, Levees, Drainage, Surface drainage, Drainage programs, Land management, Assessments, Projects, Project planning, Benefit sharing, Appraisals, Administrative agencies, Cost sharing, Cost-benefit theory, Damages.

The chief engineer of each drainage district is required to survey all lands within the district and all other lands which may be affected by improvements constructed in the district. The chief engineer's annual report is to be used as a basis for draining, leveeing, or reclaiming lands of the drainage district or preserving them from injury by overflow water. The circuit court may appoint commissioners to appraise lands to be acquired by the district for rights of way, holding basins, and other drainage works, and to assess benefits and damages accruing to district lands and other property by reason of planned land reclamation. The drainage district or any landowner in the district may file exceptions to the commissioners' report or to any assessment for either benefits or damages. (Powell-Florida)
W70-04245

DRAINAGE DISTRICTS (RECLAMATION).
Mo Ann Stat secs 242.310 thru 242.360 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Drainage districts, *Administrative agencies, *Land reclamation, Drainage systems, Drainage programs, Drainage engineering, Compensation, Damages, Eminent domain, Contracts, Ditches, Levees, Canals, Government finance, Assessments, Construction, Bridge construction, Bridges, Highways, Excavation, Laterals, Embankments, Legislation, Legal aspects.
Identifiers: *Liens.

The board of supervisors of any drainage district may petition the circuit court to change the plan for reclamation of district lands, subject to challenge by the affected landowners. The court may appoint three commissioners to assess the damages and compensation to be paid to such landowners. The board is authorized to construct or contract for the construction of any works necessary to carry out the plan for reclamation. A chief engineer shall supervise all works and improvements. Enlargement of ditches or other improvements may be authorized by the board to remedy any inadequacies in the reclamation plan. Plans for all bridges to be constructed or enlarged under the plan must be approved by the chief engineer. Corporations may be required to construct or enlarge their own bridges. Landowners may construct bridges over any drainage structure. All drainage districts may install ditches across any highway provided the district builds a bridge across the ditch. (Dearing-Florida)

A CASE FOR THE SIMULTANEOUS APPLICATION OF DETERMINISTIC AND STOCHASTIC METHODS IN HYDROLOGY,
Manchester Coll. of Science and Technology (England).
J. B. White.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 74, p 595-599, 1967. 5 p.

Descriptors: *Streamflow forecasting, *Flood forecasting, *Statistical models, Stochastic processes, Discharge (Water), Unit hydrographs, Probability, Rainfall-runoff relationships, Runoff forecasting.
Identifiers: Watershed models.

The significance of deterministic models and stochastic variables (in the sense in which the terms are used in this paper) are outlined. Possible ways of combining stochastic and deterministic analyses are given for the ideal circumstances in which

deterministic knowledge would be completely accurate. It is then shown with the aid of illustrations concerning the extension of streamflow totals and the prediction of flood discharges that when deterministic knowledge is incomplete, the application of deterministic methods and of stochastic analysis in separate stages is inadequate. Instead the whole analysis must have a stochastic framework. (K-napp-USGS)
W70-04259

DRAINAGE DISTRICTS (CONNECTING SYSTEMS AND TAXATION).

Mo Ann Stat secs 242.370 thru 242.490 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Drainage districts, *Drainage systems, *Taxes, Assessments, Government finance, Costs, Ditches, Drainage engineering, Drainage programs, Drains, Administrative agencies, Levees, Dikes, Compensation, Surveys, Land reclamation, Principal, Interest, Construction costs, Operation and maintenance, Legislation.
Identifiers: *Bonds.

All drainage systems already constructed in a newly organized drainage district may be connected and made part of the drainage plan of that district. Systems constructed after completion of the drainage plan may be connected with the district's drainage system only with the approval of the board of supervisors of the drainage district or upon petition in the circuit court. District overseers shall repair and maintain the drainage system within the district. The board may levy land taxes following a specified procedure to finance the organization, construction, and maintenance of the district. Taxes shall be levied in proportion to the benefits accruing to the lands. The board may issue bonds on the tax levies to be paid out of these taxes. (Dearing-Florida)

THE SEWERAGE AND DRAINAGE PROBLEM,
Department of Public Works, Chicago, Ill.
A. L. Tholin.
In: Environmental Engineering and Metropolitan Planning, edited by John A. Logan, Paul Opperman, and Norman E. Tucker, Evanston, Illinois: Northwestern University Press, 1963, p 91-109.

Descriptors: *Sewerage, *Drainage, *Urbanization, Conduits, Construction costs, Financing, Detention reservoirs, Gaging stations, Floodway, Floodproofing, Flood damage, Planning, Water pollution, Drainage systems, Public health, Sewage treatment.
Identifiers: *Combined sewers, *Sanitary sewers, *Storm sewers, Master plan, Sewer design, Metropolitan Sanitary District of Greater Chicago, Northeastern Illinois Planning Commission.

Recommendations are made regarding the sewerage and drainage problem. The desirable solution of the sewerage and drainage problem should include the following action: (1) convey spent water quickly by underground conduits to the place of treatment and disposal; (2) avoid combined sewers, if possible. Take a look at what they spill, and where; (3) design so as to conserve and utilize energy of flow to achieve economy of construction cost. There are many competing uses for public funds; (4) detain stormwater near the origin, where possible; next, in the neighborhood, or finally, in the valleys--but for the good of our pocketbooks and our downstream neighbors, hold all we can, as long as we can; (5) interpret river gagings with a critical eye. Estimate the effect of urbanization; (6) find out what flow-ways we need, establish and maintain them. If we can't afford to clear them all at once, try flood-proofing, and brace ourselves against damage; and (7) have a master plan. Included in the paper are: a formal comment, a discussion and a workshop regarding the subject matter. (Richard-Chicago)

A STORM DRAINAGE AND OPEN SPACE MASTER PLAN FOR HAMILTON COUNTY, OHIO,
Ralph G. Berk.
Hamilton County, Ohio Regional Planning Commission, Dec 1966. 77 p, 13 fig, 2 plate. HUD Urban Planning Project Ohio P-53.

Descriptors: *Drainage systems, Storm runoff, Sewers, Urbanization, Surface runoff, Floodproofing.
Identifiers: *Hamilton County, Ohio.

A planning study of Hamilton County, Ohio which provides a complete inventory and location of all streams, culverts, and bridges having drainage areas greater than 300 acres. Given are the complete physical characteristics of the drainage structures and the intervening reaches of their streams; a method is developed for determining flood flows. Flow quantities to be considered for design purposes are established, as well as indications for improvement of inadequate flows. The study provides accurate information about present and future flood hazards, their location and extent; about the erosion and siltation problems; and about open space needs. Provided are suggestions for subdivision regulations for the enabling and enforcing of protective measures. Supplied are guidelines for legislation necessary for carrying out any plans selected by decision makers. Suggestions for the financing and administering of public improvement programs are also made. (Starr-Chicago)

LEVEE DISTRICTS.

Ark Stat Ann secs 21-601 thru 21-653 (1968).

Descriptors: *Arkansas, *Levees, *Flood control, *Water districts, Legislation, Legal aspects, Engineering structures, Flood protection, Projects, Project planning, Civil engineering, Assessments, Land management, Administrative agencies, Administration.
Identifiers: *Levee districts.

Levee districts are created by the county court of the county containing lands subject to overflow. Consolidation of levee district boards is permitted with consent of the county courts involved whenever land in two or more counties is subject to overflow from the same crevasses or direction. Levee district boards may cooperate with any levee board of another state if necessary to complete their system of levees. Procedures for formation of the levee district and election of the directors of the levee board are enumerated. The board of directors has exclusive control and supervision of the levees in their district. The levee board determines what work must be done, what levees are to be constructed and protects the district from overflow. Procedures for assessment of lands subject to overflow and benefitted by the necessary work are enumerated. (Powell-Florida)

4B. Groundwater Management

ECONOMICS OF GROUNDWATER DEVELOPMENT IN THE HIGH PLAINS OF COLORADO,
Colorado State Univ., Fort Collins. Natural Resources Center.
D. D. Rohdy.
Available from the Clearinghouse as PB-189 781, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Completion Report, June 30, 1969. 7 p. OWRR Project B-007-COLO.

Descriptors: *Groundwater, *Development, *Linear programming, *Economic life, *Secondary effects, *Institutional structure, Farm adjustments, Aquifer, Water management, Legal problems.

Farmers using pump irrigation on the High Plains can make good returns from irrigating crops if they include sugar beets in the crop pattern and obtain high yields on all crops. High quality management is essential because average crop yields, or crop patterns without sugar beets, result in substantially lower net returns to management and labor. Irrigated agriculture on the High Plains can remain profitable for a minimum of approximately 40 years to a maximum of about 200 years depending on how fast the water is pumped from the underground aquifer. However, it should be pointed out that these estimates are based on current cost and return relationships. The secondary effects of groundwater development are the greatest on local agricultural trade and service sectors. The magnitude of these effects was estimated with an input-output study in one county on the High Plains. The income distribution effects of existing and alternative institutional arrangements for rationing water among competing users are examined for possible clues to reducing conflicts arising from the development and use of groundwater.

UNDERGROUND STORAGE OF IMPORTED WATER IN THE SAN GORGONIO PASS AREA, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
R. M. Bloyd, Jr.
Geological Survey Open-file report, July 30, 1969. 41 p, 10 fig, 7 tab, 21 ref.

Descriptors: *Water storage, *Artificial recharge, *California, Water yield, Discharge (Water), Interbasin transfers, Water resources development, Water management (Applied).
Identifiers: San Gorgonio Pass (Calif).

Estimated long-term average annual precipitation in the San Gorgonio Pass Water Agency drainage area is 332,000 acre-feet, and estimated average annual recoverable water is 24,000 acre-ft, or less than 10% of the total precipitation. Estimated average annual surface outflow is 1,700 acre-ft, and estimated average annual groundwater recharge is 22,000 acre-ft. Estimated subsurface outflow from the area in 1967 was 6,000 acre-ft into the Redlands area, 220 acre-ft into Potrero Canyon, and 800 acre-ft into the fault systems south of the Banning storage unit. An anticipated 17,000 acre-ft of water per year will be imported by 1980. Information developed in this study indicates it is technically feasible to store imported water in the eastern part of the Beaumont storage unit without causing adverse conditions and without losing any significant quantity of stored water. ARTIFICIAL RECHARGE AND ITS POTENTIAL IN ILLINOIS,
Illinois State Water Survey, Urbana. Hydrology Section.
H. F. Smith.
Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 136-142, 1967. 7 p, 1 fig, 3 tab.

Descriptors: *Artificial recharge, *Water spreading, *Filtration, *Infiltration, *Illinois, Sands, Aquifers, Gravels, Pit recharge, Porous media, Filters, Turbidity, Temperature, Water quality.
Identifiers: Peoria (Ill).

A definite relationship is shown between the grain size of filter blankets and the amounts of sediment that penetrate the aquifer through recharge pits. High rates of recharge have been achieved under certain conditions where the filter grain size was optimum, the pit the correct shape, and the permeability high. Criteria established for evaluating the recharge potential of aquifers include thickness of aquifer, areal extent of aquifer, and minimum economical withdrawal rate, as well as limits of turbidity, temperature, and mineral and bacteriological quality of recharge water. These recharge criteria were applied to areas of Illinois where aquifers were known to exist. Estimates were made of the potential artificial recharge into surface sands and gravels of the state, particularly in northeastern Illinois where population is dense and where withdrawal exceeds natural and induced recharge. (Knapp-USGS)

ARTIFICIAL CONTROL OF STATIC FISSURE-KARST WATER RESOURCES IN CARBONATE ROCKS,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
N. I. Plotnikov.
Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 132-135, 1967. 4 p, 1 tab.

Descriptors: *Water storage, *Aquifers, *Artificial recharge, *Conjunctive use, *Limestones, Infiltration, Groundwater movement, Water yield, Induced infiltration, Surface-groundwater relationships, Permeability, Pumping, Runoff, Arid lands.
Identifiers: USSR.

Carbonate rocks are characterized by high recharge rates. Given the rock thickness required and an intermittent source of runoff, artificial recharge and static storage control of groundwater are feasible using dual-purpose water-supply wells. Water supply wells are constructed in contour well systems in river valleys at depths of 150 to 200 meters. Under the effect of the intensive groundwater pumping large cones of depression are formed around the water intakes. Favorable conditions are thus created for intensive recharge by floodwater and for the complete return of the static storage previously used. Operation practice of water-supply wells in the USSR in arid regions use constant well yields up to 100,000-150,000 cu m/day (Knapp-USGS)

ARTIFICIAL RECHARGE OF WATER THROUGH WELLS: EXPERIENCE AND TECHNIQUES,
R. Sternau.
Artificial Recharge and Management of Aquifers, Symposium of Haifa, Mar 19-26, 1967, International Association of Scientific Hydrology, Publication No 72, p 91-100, 1967. 10 p, 10 fig.

Descriptors: *Artificial recharge, *Aquifers, *Limestones, *Injection wells, Hydrogeology, Water wells, Recharge wells, Groundwater management (Applied), Conjunctive use, Arid lands, Costs, Model studies.
Identifiers: *Israel, Well construction.

During recent years recharge operations were carried out in Israel in more than 100 wells. The amount of injected water totaled over 100 million cu m. In the wells of the limestone-dolomite aquifer the recharge rates reached over 2,000 cu m per hr and more during prolonged uninterrupted periods. The performance of the recharge wells are very satisfactory. Experience shows that it is unsuitable to recharge a well with free-falling water because air was sucked into wells during the process. When the inflow of water was stopped, air was released and burst out powerfully from the well casing, gathering water on its way. Where the limestone aquifer was directly overlain by layers of loose sand, the injected water rose up into the sand, and then dropped upon stoppage of injection, and subsidence of the ground occurred which caused complete loss of one well. Recommendations are made for adequate injection procedures and well construction. The choice of type of installation depends on the required hydrological benefits, and on type of operation (depending on whether a pause between injection and pumping is desired). The various techniques are compared and a proposal is made for a standardized installation to be used in wells for both pumping and recharging. (Knapp-USGS)

ARTIFICIAL RECHARGE THROUGH AUGMENTED BANK STORAGE,
Princeton Univ., N.J. Dept. of Civil and Geological Engineering.
R. J. M. De Wiest.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (Mar 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 53-68, 1967. 16 p, 6 fig, 10 ref.

Descriptors: *Artificial recharge, *Alluvium, *Groundwater basins, *New Jersey, Bank storage, Dams, Reservoirs, Floods, Streamflow, Surface-groundwater relationships, Unsteady flow.

entifiers: Princeton (NJ).

onsteady flow is examined for groundwater charge project in which rainfall runoff is returned a watertable aquifer in the vicinity of Princeton, J. The recharge is accomplished by damming a ver and its tributary and by reversing the hydrau- gradient between the river and its connected oundwater basin. Most of the natural recharge ccurs during the rainy season from November to te May. With the resulting buildup of the ground- ater level, effluent discharge to the rivers in- eases. This increase ultimately is a net loss of esh water to the ocean. This loss would be duced significantly by the construction of dams. ne increased water level in the rivers would auto- atically decrease the hydraulic gradient from the oundwater reservoir to the rivers and hence limit e effluent discharge. Simultaneously, the ground- ater reservoir would be pumped and this would ake available more storage space. (Knapp-SGS)

central Israel one of the main sources of ground- ater is a thick, highly permeable dolomite and mestone aquifer system known as the Cenomani- n-Turonian aquifer. Its porosity is mainly solution annels and cavities produced by faulting and olding. Owing to the scarcity of suitable surface eservoir sites, excess water is injected into the quifer for storage during the non-irrigation eason. One of the most important considerations planning artificial recharge is the selection of in- ction areas that are hydraulically remote from ischarge areas. The piezometric surface is very at but under natural conditions flow is generally estward and northwestward. Intensive pumping om about 1950 to the present has produced everal irregularly shaped shallow depressions. here are also several northeast trending 'hills' or idges' on the piezometric surface. The ridges ap- ear to coincide with downfaulted blocks or struc- ural basins, regarded as regions of relatively lower ermeability than adjacent regions of lower iezometric levels. As the piezometric depressions emote from the discharge areas are deepened by umping, they will become increasingly useful as orage areas for injected water. An ideal condition or an injection area is a well-defined piezometric epression with one or more piezometric 'ridges' etween it and the discharge area. (Knapp-USGS)

HE SPREADING PATTERN OF INJECTED VATER IN A PERMEABILITY STRATIFIED QUIFER,
Vater Planning for Israel Ltd., Tel Aviv.
. Mercado.
rtificial Recharge and Management of Aquifers, ymposium of Haifa (Mar 19-26, 1967), Interna- onal Association of Scientific Hydrology, Publica- on No 72, p 23-36, 1967. 14 p, 6 fig, 1 tab, 13 ref.

escriptors: *Artificial recharge, *Dispersion, Aquifers, *Anisotropy, Diffusion, Groundwater ovement, Permeability, Transmissivity, Porosity, tratification, Surveys, Model studies, Water yield, ischarge (Water), Recharge, On-site tests, Injec- on wells.
dentifiers: *Israel.

An explanation is given of the existence of a transition zone between injected water and aquifer water, developed on the assumption of flow through a permeability horizontally stratified aquifer, in which the frequency of permeabilities follows approximately the normal distribution function. The resulting transition zone is 'S'-shaped, and similar to that caused by dispersion. Its shape depends on the permeability distribution factor. The width of the transition zone caused by the horizontally stratified flow is directly proportional to the distance travelled, while the width of the transition zone caused by dispersion is proportional to the square root of the distance travelled. The width of the dispersion transition zone increases during the return flow, whereas width decreases in the case of horizontally stratified return flow. It is believed that in nature the flows occur simultaneously and thus the shape and width of the transition zone is the resultant of the two processes. A field experiment of the 'injection-pumping pair' type carried out at the Haifa Bay Experimental Field is described and interpreted. The results of the investigations in the experimental field are applicable to large-scale underground recharge and mixing operations. (Knapp-USGS)

Identifiers: *France, Verdun, Lorraine.

To provide for increasing water needs of France's North and Lorraine industrial areas, a plan is proposed to use Jurassic karstic limestones near Verdun for water storage. Winter high streamflow will be stored by recharge wells to supply summer withdrawal of 100,000 cu m/day without decreasing riverflow of alluvial water supplies. Pumping rates will be controlled by use of data from a network of monitor wells. Results of 5 years of field study including a 200-day pumping test are tabulated and shown graphically. (Knapp-USGS)

Identifiers: *Kalamazoo (Mich), *Induced aquifer leakage.

The U. S. Geological Survey and the city of Kalamazoo, Michigan, conducted tests to demonstrate the feasibility of recharging an artesian glacial-drift aquifer by inducing leakage to it from a surficial sand aquifer. The surficial sand is under water-table conditions and in direct hydraulic connection with a creek draining it. Coefficients of leakage for the aquiclude ranged from 0.042 to 1.3 gpd/ sq ft/ft. The piezometric surface in the lower aquifer was higher than the water table in the upper sand, and leakage through the aquiclude was upward. Withdrawal of water from the lower aquifer reversed the direction of leakage, but sustained pumping would have resulted in objectionable declines in the piezometric surface and probable inflow of poor-quality water from below. Tests were run by pumping from the lower aquifer under different conditions of artificial recharge of the upper aquifer. Each test resulted in increased head differences between the upper and lower aquifers, which increased the rate of leakage and raised water levels in the lower aquifer. The rates of leakage were 1,600-1,900 gpm, respectively. After 6 years of pumping at the well field with artificial recharge, water levels have not declined appreciably. (Knapp-USGS)

RECHARGE AND WATER INJECTION IN UNDERGROUND AQUIFERS (IN FRENCH),
J. Tixeront, and J. M. Daniel.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 173-181, 1967. 9 p, 1 fig, 7 ref.

Descriptors: *Artificial recharge, *Water spreading, *Induced infiltration, *Permeability, *Infiltration, Groundwater movement, Arid lands, Sands, Silts, Clays, Water quality, Turbidity, Analog models, Resistance networks, Optimization, Discharge (Water), Water yield.
Identifiers: France, Clogging.

Thorough analysis of natural recharge conditions is essential to operate an artificial recharge plant. Water quality, particularly suspended load, is the main factor of the analysis. Drying of mud crusts after floods, and wind erosion during summer could explain the continuous recharge of arid zone aquifers in spite of alluvial deposition of mud on recharge areas during floods. The Oued Biskra, Algeria study gives an example of such a process and shows the smoothing of a discontinuous recharge into a continuous discharge through an underground reservoir. Moreover this example shows that artificial recharge can be induced by modifying the initial natural state by pumping. By means of an analog RC network it has been possible to find the optimal value of exploitable discharge of the system by computing the daily natural rate of recharge into the reservoir from observed variations of water level caused by flooding. Gilbert Castany.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 413-425, 1967. 13 p, 9 fig, 2 tab, 13 ref.

Descriptors: *Water storage, *Regulation, *Reservoirs, *Artificial recharge, Hydrogeology, Aquifers, Injection wells, Water spreading, Forecasting.
Identifiers: France, Algeria, Tunisia.

Irregularity of surface water supplies and, to some extent, groundwater supplies, necessitates some form of water regulation reservoir use for efficient regional development. Surface reservoirs or groundwater recharge may be used. Examples are given of the use of groundwater reservoirs for regulation storage in France, Algeria, and Tunisia. To use underground storage, a thorough knowledge of the hydrogeology of the area is necessary. (Knapp-USGS)

ECONOMIC ASPECTS OF CONJUNCTIVE USE OF WATER, SMITH VALLEY, NEVADA, USA,
Nevada Bureau of Mines, Reno. Desert Research Inst.
Patrick A. Domenico.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 474-482, 1967. 9 p, 6 fig.

Descriptors: *Water resources development, *Conjunctive use, *Nevada, *Economics, Aquifers, Streams, Groundwater, Surface waters, Optimum development plans, Water management (Applied), Water supply.
Identifiers: *Smith Valley (Nev).

Supplemental irrigation wells in Smith Valley, Nevada, USA, are individually owned and operated and their use is permitted in conjunction with surface water for irrigation of about 6300 acres whereas an additional 8700 acres have surface-water rights only. Owing to the developed capacity of the wells, most conjunctive appropriators are virtually assured of a full supply of irrigation water every season regardless of the availability of surface water. Predicted on the basis of historic flow and well yield and assuming centralized control of the well fields for the benefit of the entire valley, the existing pumping facilities could provide about 93% assurance of a full supply of irrigation water for all appropriators. Thus, the problem reduces to one of a proper scale of operation. Analysis based on returns from ranching and cost of supplemental water for various levels of demand, efficiency, and lift, suggests that more groundwater could be pumped cheaper with the existing pumping facilities if the operation were centralized instead of under individual control. 'ONE HUNDRED AND TWENTY-THREE FEET LONG': THE HORIZONTAL WELL AS A NEW METHOD OF RANGE WATER DEVELOPMENT,
Arizona Univ., Tucson. Cooperative Extension Service.
W. T. Welchert, and Barry N. Freeman.
Progressive Agriculture in Arizona, Vol 21, No 6, p 8-11, November-December 1969. 6 fig.

Descriptors: *Wells, *Stock water, *Range management, *Hydrogeology, *Perched water, *Drilling, Drilling equipment, Arizona, Arid lands, Logging (Recording).
Identifiers: *Horizontal wells, San Carlos Indian Reservation, Arizona.

The introduction of horizontal well drilling could revolutionize stock water development in Arizona and the West. Dirt tanks, trick tanks, and conventional wells are either unreliable, expensive, or require a great deal of maintenance. All of these problems are overcome with horizontal wells. The wells are 'cased springs' and require no power system to pump and dispense the water. This is due to the tapping of water trapped in dike formations or perched water tables. The drilling process and pumbing installation are both very simple. Total development cost for the well installations average $500.00 per site. Among the advantages of the horizontal wells are: very small water loss; low-cost maintenance; small initial investment; sanitary water supply; and greater chance of developing a successful well. PRELIMINARY DETERMINATIONS OF HYDROBIOLOGICAL CONDITIONS IN THE VICINITY OF THE PROPOSED JETPORT AND OTHER AIRPORTS IN SOUTH FLORIDA, JULY 1969,
Geological Survey, Tallahassee, Fla.
Benjamin F. McPherson.
Geological Survey Open-file Report, Feb 1970. 31 p, 2 fig, 11 tab, 4 ref, append.

Descriptors: *Water quality, *Swamps, *National parks, *Florida, *Airports, Surveys, Wetlands, Aquatic environment, Water pollution effects, Aquatic habitats, Urbanization, Conservation.
Identifiers: Everglades, Everglades National Park.

Because of concern over the possible hazards posed by the Miami Jetport for Everglades National Park and the surrounding environment of south Florida, water quality data were collected before its opening. As Everglades National Park depends on a certain seasonal flow of unpolluted water, knowledge of the flow and quality conditions are needed so that any development to the north be designed to avoid causing ecological damage. Before any assessment of biological or water-quality changes can be made, pre-flight conditions must be known. Twenty-two stations were selected and sampled in April and July 1969. Three of these were at canals near existing commercial airports farther east. The remaining stations were located within a 30-mile radius of the Jetport. This report gives the results from the samples collected in July. (Knapp-USGS)

AN APPRAISAL OF A LAKE MICHIGAN SITE FOR CHICAGO'S THIRD AIRPORT.
Department of Public Works, Chicago, Ill.

Harza Engineering Co., Chicago, Ill., 1967. 49 p, 1 map, 5 fig, 2 photo, 1 append, 3 tab.

Descriptors: *Airports, *Lake Michigan, Dikes, Economic feasibility, Wave pile-up, Sand bars, Water quality, Sediment distribution, Cost comparisons, Access routes.
Identifiers: *Engineering feasibility, Polders.

The preliminary findings of five major categories of planning studies are presented in this report: (1)

establishment of basic requirements; (2) preliminary project design; (3) site investigations; (4) construction materials, methods and schedules ; and (5) estimate of cost. Consultants to the City of Chicago in the process of establishing the requirements for aviation, environment and navigation included: (1) Landrum and Brown, aviation consultants; (2) the Federal Aviation Agency; (3) the Federal Water Pollution Control Administration; (4) the Corps of Engineers; and the U.S. Army-Chicago District. The preliminary findings indicate that the development of an airport site in Lake Michigan is technically feasible. The costs estimates, prepared on the basis of a four year construction period, indicate that the construction cost will be about $247 to $284 million. This estimate is based on a site centered 5 1/2 miles east of Lake Shore Drive at 31st Street. Estimates are also given for three other locations and for an airport area larger than the one detailed in this report. (See also W70-04440 thru W70-04443). (Starr-Chicago)
W70-04439

CHAPTER 2: DESCRIPTION.
Department of Public Works, Chicago, Ill.

In: An Appraisal of a Lake Michigan Site for Chicago's Third Major Airport, Harza Engineering Co., Chicago, Ill., 1967. p 4-8.

Descriptors: *Airports, *Lake Michigan, Dikes, Access routes, Locating.
Identifiers: *Engineering feasibility, Polders.

For the purpose of this report, it has been assumed that the lake airport site would be circular in plan and have a diameter four miles enclosing 8,000 acres and would be located between 12th Street and 45th Street with two approaches: (1) a causeway and bridge from the Stevenson Expressway; and (2) a tunnel from 31st Street. The definite designs presented here are for the purpose of cost estimation, determination of feasibility, and evaluation of construction materials, methods and schedules; the final location will depend upon the recommendations of the FAA and the city's aviation consultants. The dominating element in the Lake Michigan Airport will be the enclosure dike; the height will vary from 50 to 80 feet and its dumping silty or clayey sands in the central part of the embankment. Sanitary sewage and runoff from the surfaced airport area will be collected separately without pollution of the lake in a detention pond with a minimum surface area of approximately 200 acres and an additional area reserved for water storage during precipitation periods. (See also W70-04439). (Starr-Chicago)
W70-04440

CHAPTER 4: CONSTRUCTION.
Department of Public Works, Chicago, Ill.

In: An Appraisal of a Lake Michigan Site for Chicago's Third Major Airport, Harza Engineering Co., Chicago, Ill., 1967. p. 24-36, 1 tab.

Descriptors: *Airports, *Lake Michigan, *Economic feasibility, Time.
Identifiers: *Engineering feasibility.

Considered in this chapter are the questions of construction feasibility and time. The results of surveys carried out to find the answers to these questions are presented. The purpose of these surveys was to determine: (1) if sufficient materials are available within practical distances and (2) the cost of obtaining, transporting and placing the materials. Future studies will attempt to define specific areas from which materials can be obtained and transported at minimum cost. Maps prepared by the Illinois Geological Survey indicate that there are many areas in northeastern Illinois with sizeable sand and gravel deposits. A side benefit that could be obtained from the use of Illinois resources is the possibility of forming large recreational lakes. The methods used to construct the lake airport will influence the project design, cost and construction time. Research will be done into special handling methods; but an assumption has been made during this appraisal phase that conventional equipment and construction methods would be used. (See W70-04439). (Starr-Chicago)
W70-04441

CHAPTER 5: COST.
Department of Public Works, Chicago, Ill.

In: An Appraisal of a Lake Michigan Site for Chicago's Third Major Airport, Harza Engineering Co., Chicago, Ill., 1967. p 37-42, 3 tab.

Descriptors: *Airports, *Lake Michigan, *Economic feasibility, Location, Access routes, Cost comparison.
Identifiers: *Engineering feasibility.

The total construction cost of this plan for the lake airport is estimated to be in the range of $247 to $284 million. A description is given in this chapter as to how the costs were estimated, and the estimated costs at three alternative locations are also presented in table form. None of the information presently available indicates that movements of the site for distances up to three miles in a northerly or southerly direction, parallel to the shoreline would cause a significant change in cost. For a more easterly location farther out into the lake, the costs would increase inasmuch as more fill would be required for higher embankments, wave action would be more severe, and access facilities would have to be longer. An accompanying table indicates that the incremental cost per acre decreases rapidly with increasing airport size. (See W70-04439). (Starr-Chicago)
W70-04442

CHAPTER 6: FUTURE STUDIES.
Department of Public Works, Chicago, Ill.

In: An Appraisal of a Lake Michigan Site for Chicago's Third Major Airport, Harza Engineering Co., Chicago, Ill., 1967. p 43-49.

Descriptors: *Airports, *Lake Michigan, Project planning, Sand bars, Clay loam, Gravels, Sands, Dike, Access routes.
Identifiers: *Engineering feasibility.

Future planning for the Lake Michigan Airport will depend to a degree upon the recommendation of FAA and city aviation consultants in regard to the location and size of the airport. There are two broad categories of future planning investigations: (1) field work to map the lakebed in the project area, exploration of foundation conditions, inventory of available materials, and laboratory analyses of the resulting data; and (2) verification and refinement of project designs so as to focus on environmental effects of the lake project and on the dike and access designs. The study of environmental effects will be done by means of hydraulic model testing and the collection of additional field data to supplement existing information. A small-scale model of the airport vicinity will be built to study the effect of the airport upon lake currents. Additional data will be obtained by measuring actual current velocities in the lake and by taking samples of lake water for an analytical study of the water quality. (See W70-04439). (Starr-Chicago)
W70-04443

4D. Watershed Protection

SOIL CONSERVATION DISTRICTS.

Va Code Ann secs 21-1 thru 21-5 (1960).

Descriptors: *Virginia, *Soil conservation, *Agricultural engineering, *Erosion control, Legislation, Water conservation, Soil erosion, Sediment control, Runoff, Irrigation engineering, Drainage, Flood prevention, Dams, Channel improvement, Public health, Reservoirs, Soil contamination, Soil management, Soil stabilization, Multiple-purpose projects, Agriculture, Flood control, Terracing, Contours.

The policy of the legislature is to provide for the conservation of soil resources, for the control and prevention of soil erosion, for the prevention of floodwater and sediment damages, and for furthering agricultural phases of water conservation. In so doing, the legislature intends to preserve natural resources, control floods, prevent impairment of dams and reservoirs, maintain the navigability of rivers and harbors, preserve wildlife, protect public land, and promote the general health, safety, and welfare of the people. A detailed list of the conditions and consequences leading to this legislative determination is included. Among these are soil erosion in the form of destructive sedimentation, increased flooding, and deterioration of soil and crops caused by improper land-use practices. Appropriate corrective methods, including land-use reforms, soil conservation practices, and engineering improvements, are endorsed. A section of definitions is included. Cooperation among soil conservation districts and between these districts and state agencies is authorized and prescribed. (Schram-Florida)
W70-04221

DRAINAGE AND SOIL CONSERVATION.
Va Code Ann secs 21-53 thru 21-57, 21-59 thru 21-62, 21-65 (1960), as amended, (Supp 1968).

Descriptors: *Virginia, *Soil conservation, *Water conservation, *Administrative agencies, Legislation, Demonstration farms, Erosion control, Land resources, Drainage, Irrigation, Soil erosion, Flood prevention, Water districts, Damages, Structures, Agricultural engineering, Cultivation, Sediment control, Multiple-purpose projects, Soil investigations, Soil management, Fertilizers, Seeds, Farm equipment.
Identifiers: *Conservation districts.

Soil and water conservation districts are authorized to conduct surveys and research relating to: (1) the character of soil erosion and floodwater and sediment damages; (2) agricultural phases of the conservation, utilization, and disposal of water; and (3) the preventive and control measures and improvements needed. They may publish their findings, disseminate information, and conduct demonstrational projects. These districts are authorized to carry out preventive and control measures for flood prevention or agricultural water conservation. These activities may be carried out on state lands or other lands within the district with the consent of the owner. The districts may offer financial aid and cooperation to land occupiers to carry out the objectives of this act. The districts may make agricultural and engineering machinery, fertilizer, seeds, and other equipment available to land occupiers within the district to assist in the prevention and control of soil erosion and for flood prevention. The districts may construct, improve, operate, and maintain all necessary or convenient structures for the purpose of this act. They may develop comprehensive plans and programs for soil and water conservation and may acquire and administer water and soil conservation projects. For these purposes, they may operate as agencies of the state or of the United States. (Schram-Florida)

APPLICATION OF RADIOISOTOPE TECHNIQUES TO A CRITICAL WATER RESOURCES PROBLEM AREA - NAMELY NUTRITIONAL POLLUTION,
Oklahoma Univ., Norman. Dept. of Civil Engineering and Sanitary Science; and Arkansas Univ., Fayetteville. Dept. of Civil Engineering.
George W. Reid, Robert A. Gearheart, James M. Robertson, and Robert M. Sweazy.
Available from the Clearinghouse as PB-189 793, $3.00 in paper copy, $0.65 in microfiche. Oklahoma State University Water Resources Research Institute Project Completion Report, 1969. 14 p, 1 fig, 1 tab, 1 append. OWRR Proj No A-011-OKLA.

Descriptors: *Eutrophication, *Nutrients, *Phosphorus compounds, Algae, Phosphates, Nitrates, Sewage effluents, Tertiary treatment, Water pollution sources, Water pollution effects, Laboratory tests, Model studies, Radioactivity techniques, Tagging.
Identifiers: Nutrient requirements (Algae).

Minimal concentrations of nitrogen and phosphorus necessary for the growth of algae were studied. A radioactive phosphorus method was used as one of the parameters for biological mass produced and phosphorus uptake rate in alga culturing unit. All other necessary inorganic and organic nutrients, including vitamin B-12 and other growth metabolites, were supplied in excess to allow maximum algae reaction to the nitrogen and phosphorus. The relationship between nitrogen, phosphorus and algal growth is expressed by a multiple regression analysis procedure. A bacterial bloom occurs within the second or third day in contrast to the algae growth which usually requires 6 to 8 days. The soluble phosphate is taken up 80-90% in the first day. At a phosphate concentration of 0.10 mg/l, the algal bloom condition threshold is reached. Regardless of the nitrogen concentration, this narrow range of sensitivity to the phosphorus concentration demonstrates the problem in attempting to control nutritional pollution. (Knapp-USGS)

THE CALCULATION OF THE ACUTE TOXICITY OF MIXTURES OF POISONS TO RAINBOW TROUT,
Water Pollution Research Lab., Stevenage (England).
V. M. Brown.
Water Research, Vol 2, p 723-733, 1968. 8 fig, 2 tab, 20 ref.

Descriptors: *Ammonia, *Phenols, *Copper, *Bioassay, Hydrogen ion concentration, Water chemistry, *Water analysis, *Analytical techniques, Alkalinity, Water pollution effects, Toxicity, Lethal limit, Laboratory tests.
Identifiers: *Zinc, *Cadmium, *Lead, *Nickel, *Hydrogen cyanide, *Pollutant mixtures.

The estimation of the acute toxicity to trout of mixtures of the common industrial pollutants ammonia, phenol, zinc, copper, cadmium, lead nickel, and hydrogen cyanide is described. This is done from a knowledge of the concentrations of these poisons and of the temperature, pH value, total hardness, bicarbonate alkalinity, total dissolved solids concentration, and dissolved-oxygen concentration of the dilution water. The toxicity of the mixture is taken to be the sum of the proportions of the acutely toxic concentration of each poison. The assumptions made in the use of this method are discussed along with its limitations, and the fact that in critical areas of study, such estimates can never be substitutes for the actual determination of the toxicity of a water by the use of fish is stressed. KEYS TO WATER QUALITY INDICATIVE ORGANISMS (SOUTHEASTERN UNITED STATES),
Toronto Univ. (Ontario). Dept. of Zoology.
R. O. Brinkhurst.
US Dep of the Interior, Federal Water Pollution Control Administration, undated. 17 p, 14 fig, 6 ref.

Descriptors: *Oligochaetes, *Water quality, Fresh water, Great Lakes region, Habitats, Tubificids, Water pollution, Sludge worms.
Identifiers: *Taxonomic key, North America East of Rocky Mountains, Acolosomatidae, Naididae, Enchytraeidae, Lumbriculidae, Opistocystidae, Setae, Branchiobdellidae, Bifid crotchets.

In identifying the Oligochaeta, by making keys to the most important family, the Tubificidae, and proceeding directly to species without keying out the genera, it has become possible to identify specimens from simple whole-mounts. About half of the Tubificidae may be identified from immature specimens; mature specimens are required for the rest--mature specimens are usually present in any community. These worms are hermaphrodite, with no larval stages. Upon studying the serial sections and the worms placed in the proper genera, species can often be fitted into the key using only superficial characters recognizable in whole-mounts. Good results depend on proper preparation and examination of material and understanding the salient anatomical features used in the key. Method of preparation and preservation is given. Principal features are the several types of setae. Bifid crotchets are found in both dorsal and ventral bundles in Naididae, Tubificidae and Lumbriculidae. A generalized plan of genitalia of a tubificid is given. Descriptions of various families, listing the approximate number of species in freshwaters east of the Rocky Mountains, and their normal habitats may be of more immediate value than the formal key given. DEVELOPMENT OF A METHOD FOR THE TOTAL COUNT OF MARINE BACTERIA ON ALGAE,
McGill Univ., Montreal (Quebec). Dept. of Microbiology and Immunology; and New Brunswick Univ., Fredericton. Dept. of Biology.
E. C. S. Chan, and Elizabeth A. McManus.
Canadian Journal of Microbiology, Vol 13, p 295-301, 1967. 2 fig, 3 tab, 10 ref.

Descriptors: *Marine bacteria, *Algae, *Analysis, *Analytical techniques, Temperature, Piptides, Intertidal areas, Soil bacteria, Laboratory tests.
Identifiers: *Algae homogenization, *Bacteria count, Waring Blendor mortality, Cell wall, Hexosamine, Ascophyllum nodosum, Polysiphonia lanosa, Point Lepreau (Canada), New Brunswick (Canada), Servall Omni-Mixer homogenizer.

In an initial attempt to develop a technique for enumeration of bacteria on littoral algae, it was observed that homogenization of algal samples in the Waring Blendor resulted in mortality of marine bacteria samples, apparently due to singular susceptibility to manipulations. Further work on this lethal effect of blending showed two detrimental factors, heat and mechanical injury of the cells, were implicated: due to the increase in temperature during homogenization (temperatures slightly beyond 35C result in rapid bacterial killing) and the high speed rotation of the knife-blade assembly of the Waring Blendor. These findings resulted in a satisfactory technique for obtaining homogenates of marine materials to obtain total bacteria count

using a Servall Omni-Mixer homogenizer at eds of about 5000 revolutions per minute and nperature of homogenization not exceeding C. With this method, it was possible to make an ensive study of ecology of marine bacteria on ysiphonia lanosa and Ascophyllum nodosum, former alga growing epiphytically on Ascophyl-. (Jones-Wisconsin)

ntifiers: *Nutrient elements, Phosphorus ease, Sample preservation, Water dynamics, ter constituents, Analytical chemistry, Waste er effects, Lake Mendota (Wis), Black Earth eek (Wis).

rious steps must be taken to achieve rational nagement of water basins invaded or threatened noxious aquatic weeds. The first phase of an rophication study involves a decision on the thod, location, and frequency of sampling, and manner of sample preservation. Next, is the ection of methods of analyses appropriate to the uired accuracy of results. Finally, a critical luation of results obtained as to their general re-ility and statistical significance. Detailed infor-tion on sources, forms, and methods of analysis plicable to nitrogen and phosphorus are given. dition of mercuric chloride and freezing to -C, rather than the use of chloroform and drogen sulfate, is recommended for the preserva-n of nitrogen forms and phosphorus compounds stored water samples. A warning is given about ssibility phosphate loss due to sorption by glass plastic containers. (See Vol. 3, No. 10, Field 5C, 0-03975). (Wilde-Wisconsin)

SIMPLE PIPETTE CONTROL FOR ISOLAT-G PLANKTONIC ALGAE,
ode Island Univ., Kingston. Graduate School of eanography.
nda J. Boleyn.
nadian Journal of Microbiology, Vol 13, p 1129-30, 1967. 1 fig, 4 ref.

scriptors: *Algae, *Analytical techniques, ankton, *Laboratory tests, *Isolation, *Control, thodology, Cultures, Testing, Capillary conduc-ty, Bacteria, Diatoms, Test procedures.
ntifiers: *Pipette, Unialgal, Nitzschia, Algae lation, Capillarity, Capillarity control device.

levice for simplifying the isolation of plankton or er small particles has been developed. It erates by controlling the capillarity of the fine-ped pipette routinely used for phytoplankton lation. The inward and outward flow of fluid y be controlled smoothly and completely. There a number of advantages in this device over the modified isolating pipette. A steady hand is easi-maintained since the hand guiding the pipette ed not control capillarity also. The operator is e to nudge and steer reluctant or adhering forms o the pipette, especially where long slender cells, ose forms, or chain-formers might easily cluster l occlude the tip. A pipette with an orifice of all or large size may be used, making it helpful to late large or peculiarly shaped cells. The explo-e nature of pipette delivery is lessened and bub-ng is prevented. Motile organisms may be fol-ved and caught readily. The entire procedure is hastened, diminishing danger of thermal shock, especially important for winter forms. Also the risk of producing appreciable salinity changes is minimized. (Jones-Wisconsin)

A WATER CORE PLANKTON SAMPLER,
South Dakota Cooperative Fishery Unit, Brookings.
Richard L. Applegate, Alfred C. Fox, and Victor J. Starostka.
Journal Fisheries Research Board of Canada, Vol 25, No 8, p 1741-1742, 1968. 1 fig.

Descriptors: *Cores, *Plankton, *Sampling, Population, Zooplankton, Ice, Columns, Depth, Ponds, Lakes, Seasonal Littoral.
Identifiers: Vertical sampling.

A rapid method for quantitative sampling of net plankton populations was provided by a device constructed from irrigation pipe. It was developed for collecting zooplankton under ice cover, when metered townets could not be conveniently used. Error associated with back-flushing when a plankton net is drawn through a vertical water column is eliminated, thus the quantity of net plankton can be determined accurately. Consisting of 152-millimeter-diameter aluminum pipe, the sampler is light weight, simple to operate, and economical. The hinged bottom section to which the net is attached, is held open by a line attached to the bucket. The net is brought into the filtering position by pulling the lazy-line after the sampler is lowered to the desired depth. As the sampler is raised and the column of water strained, the net is fixed in place by a spring latch. By adding or removing sections of pipe, the sampler can be adapted for any depth, making it a convenient tool for sampling net plankton populations in ponds and littoral areas of lakes throughout all seasons. COMPUTER SIMULATION OF WASTE TRANSPORT IN GROUNDWATER AQUIFERS,
Colorado State Univ., Fort Collins. Natural Resources Center.
D. L. Reddell, and D. K. Sunada.
Available from the Clearinghouse as PB-189 769, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 13 p, 8 ref. OWRR A-001-COLO.

Descriptors: *Computer models, *Groundwater, *Dispersion, *Waste dilution, Water pollution sources, Numerical techniques, Saline water freshwater interfaces.

A computer simulation of the convective-dispersive process of the movement of pollutants in groundwater systems was developed and tested for several conditions. An implicit numerical technique was used to solve the flow equation and the method of characteristics used to solve the convective-dispersion equation. The model was tested by applying it to longitudinal dispersion problem and the longitudinal and lateral dispersion problem. The tensorial nature of the dispersion coefficient was demonstrated by solving a problem in the rotated coordinate system. The model was successfully used to solve the salt-water interface problem.

POTOMAC ESTUARY MATHEMATICAL MODEL,
Federal Water Pollution Control Administration, Annapolis, Md. Chesapeake Field Station.
Leo J. Hetling.
Water and Sewage Works, Vol 117, No 2, p 47-51, Feb 1970. 5 p, 7 fig, 8 ref.

Descriptors: *Systems analysis, *Mathematical models, *Estuaries, Water management (Applied), Research and development, Water quality, Water yield, Water supply, Flow, Path of pollutants, Water pollution control, Waste water treatment.
Identifiers: Potomac River, Potomac Estuary.

Publications concerning systems analyses and mathematical modeling of the Potomac Estuary are reviewed and discussed briefly. A systems analysis approach has been undertaken by the Federal Water Pollution Control Administration (FWPCA) in investigating the water quality responses in the Potomac River basin. The analyses included the effects of low flow augmentation, wastewater diversions, water supply withdrawals, and increased degrees of wastewater treatment on water quality in the upper estuary. Several techniques of mathematical models capable of simulating the response of water quality in an estuary were available when the study of the Potomac Estuary was undertaken in 1965. The segmented estuary model developed by Thomann was selected as the one which most closely conformed to the requirements of the study. The segmented model is highly flexible and capable of being utilized to describe almost any pollutant. Its accuracy is adequate for engineering design purposes. Properly programmed, the digital computer makes possible solutions of the systems available in minutes at a relatively small cost. (Knapp-USGS)

FRESHWATER ECOLOGICAL STUDIES IN PANAMA AND COLUMBIA,
Battelle Memorial Inst., Richland, Wash. Environmental and Life Sciences Div.
W. L. Templeton, J. M. Dean, D. G. Watson, and L. A. Rancitelli.
BioScience, Vol 19, No 9, p 804-808, 1969. 2 fig, 4 tab, 5 ref.

Descriptors: *Ecosystems, *Rivers, Chemical analysis, Fish, Crustaceans, Reptiles, Gastropods, Radiation, Nuclear engineering.
Identifiers: *Nuclear excavations, *Panama, *Colombia, *Radionuclides, Activation analysis, Specific activity, Concentration factors, Radiation dose, South America, Tissue analysis, Vegetation canopy.

Studies were made to acquire data for evaluation and prediction of potential radiation dose to indigenous populations in the region of proposed nuclear excavations. Freshwater rivers and streams supply water for domestic use and food in forms of fish, reptiles, and macroinvertebrates; in areas accessible to the sea, marine food organisms are preferred over freshwater forms. Daily consumption is estimated at 100 grams aquatic food and 4 liters water. Collections were made at 19 stations in Panama and 15 stations in Colombia; chemical and activation analyses were made of water, suspended solids, and tissue. Low concentrations of elements suggest high capacity for retention and cycling in terrestrial-soil ecosystem. Interflow predominates over sheet run-off. Water samples show relatively high concentrations of sodium, magnesium, cobalt, chromium, and cesium and low concentrations of potassium, iron, and antimony compared with mean values for all rivers. Concentration factors of stable elements vary with tissue analyzed, being highest for phosphorus, mercury, potassium, and copper. Contribution of direct fallout to freshwater ecosystem is likely to be small owing to vegetation canopy. Occurrence of peak concentrations will depend on rate of movement through terrestrial and groundwater systems; these should dampen the peaking effect. (Voigtlander-Wisconsin)

POLLUTION AT THE SOUTHERN END OF LAKE MICHIGAN (WATER POLLUTION),
James C. Vaughn.
Am Water Wks Ass'n J, Vol 61, No 11, p 603-609, Nov 1969. 7 p, 1 ref.

Descriptors: *Water pollution, *Water quality control, *Water pollution sources, *Pollution abatement, Treatment facilities, Aquatic micro-biology, Impaired water quality, Pollutant identification, Water pollution treatment, Water pollution effects, Plankton, Aquatic bacteria, Direct costs, Effluents, Administration, Statistics, Sampling, Industrial wastes, Chemical wastes, Sewage treatment.
Identifiers: Treatment costs.

The Chicago-Southern Lake Michigan areas has a long history of battling water pollution. Various administrative boards--state, regional, and federal--have been formed to deal with the problem. Material presented at conferences of these boards reveals the scope of the pollution problem. Domestic sewage pollution has been somewhat alleviated, but data collected from the several sampling points in the Chicago metropolitan area and in Lake Michigan reveal that chemical and bacterial pollution is still a serious problem. Pollutants such as ammonia nitrogen, coliform organisms, plankton, phenol, and hydrocarbons are much in evidence as shown by several graphs and tables and the prevailing trend is toward more pollution. Rising pollution treatment costs have added to the difficulties. Industrial wastes are increasing, giving rise to the plankton pollution and offensive tastes and odors in the water. The article states that unless there is a quantitative reduction in these industrial wastes, there will be little chance to improve water quality. (Caldwell-Florida)

COMPUTER MODEL OF CONNECTICUT RIVER POLLUTION,
United Aircraft Corp., East Hartford, Conn. Research Labs.
Thomas E. Hoover, and Robert A. Arnoldi.
Journal Water Pollution Control Federation, Vol 42, No 2, Part 2, p R67-R75, Feb 1970. 9 p, 4 fig, 1 tab, 11 ref.

Descriptors: *Water pollution, *Rivers, *Computer models, *Connecticut, Mathematical models, Stochastic processes, Statistical methods, Path of pollutants, Water pollution treatment, Water pollution control, Biochemical oxygen demand, Sewage treatment, Thermal pollution, Dissolved oxygen.
Identifiers: Connecticut River.

A computer model designed to reproduce the physcial and chemical processes in the Connecticut River was used to predict the effects of wastewater disposal, aeration, and thermal pollution on the DO and BOD in the river. Actual chemical and physical input data used for the construction of the model were obtained from six independent sources. The DO and BOD concentrations were calculated for a simulation period of 48 hr and presented graphically as a function of time using a special contouring system developed for this study. After the capability of the model was proved by duplicating existing DO and BOD concentration levels in the river, the program was used to demonstrate that a reduction in the wastewater dumped into the river would produce a significant improvement in water quality, whereas aeration would produce only a minimal improvement. River modeling techniques using actual data may be useful in water quality management. (Knapp-USGS)
W70-04302

PARATHION DEGRADATION IN LAKE SEDIMENTS,
Wisconsin Univ., Madison. Dept. of Soil Science; and Texas Christian Univ., Fort Worth. Dept. of Geology.
Donald A. Graetz, Gordon Chesters, Tommy C. Daniel, Leo W. Newland, and Gerhard B. Lee.
Journal Water Pollution Control Federation, Vol 42, No 2, Part 2, p R76-R94, Feb 1970. 19 p, 7 fig, 4 tab, 18 ref. OWRR Grant No B-016-WIS, and FWPCA Training Grant No 5T1-WP-100.

Descriptors: *Biodegradation, *Organophosphorus pesticides, *Bottom sediments, Aerobic conditions, Anaerobic conditions, Chemcial reactions, Hydrolysis, Insecticides, Lakes.
Identifiers: Parathion degradation

Mechanisms and rates of parathion degradation were determined in a sterile sediment, in aerobic and anaerobic 1-percent peptone solutions, in a peptone-enriched sediment system, and intact sediments from two Wisconsin lakes. Chemical degradation involved hydrolysis at the nitrophenyl C-O-P bond resulting in the formation of diethylthiophosphoric acid and p-nitrophenol. The rate of parathion hydrolysis in an aqueous parathion solution containing sterile sediment was 0.15 to 0.18 percent of added parathion per day. Aminoparathion was degraded further under aerobic conditions but not under anaerobic conditions. Parathion degradation was slower in a slightly acid sediment than in a calcareous sediment. Rates of parathion degradation averaged 0.28 percent of added parathion per day in aqueous suspensions containing 90 and 200 mg Lake Tomahawk sediment compared with 0.54 and 0.74 percent of added parathion per day in suspensions containing 0.5 and 1.5 g Nagawicka sediment. (Knapp-USGS)

GROUNDWATER FLOW SIMULATED ON COMPUTER AIDS NUCLEAR PLANT RADIOACTIVE WASTE STUDY,
Battelle-Northwest, Richland, Wash. Water Resources Systems Section.
Robert T. Jaske.
Industrial Water Engineering, Vol 6, No 12, p 48-49, Dec 1969. 2 p 7 fig.

Descriptors: *Groundwater movement, *Mapping, *Flow nets, *Computer programs, Data processing, Forecasting, Water levels, Water table, Water level fluctuations, Computer models, Hydraulics.
Identifiers: Groundwater flow simulation.

In studying underground disposal systems for the Hanford nuclear plant, Battelle-Northwest developed a computer program which simulates the flow of groundwater. Flow patterns are displayed on a cathode-ray screen. Examples are given of the output of this program, showing the effect of adding additional points of withdrawal and injection to the original flow pattern. These changes are produced in a matter of seconds. (Knapp-USGS)
W70-04309

BEHAVIOR AND REACTIONS OF COPPER SULFATE IN AN IRRIGATION CANAL,
Battelle Memorial Inst., Richland, Wash; and Agricultural Research Service, Prosser, Wash. Crops Research Div.
J. L. Nelson, V. F. Bruns, C. C. Coutant, and B. L. Carlile.
Pesticides Monitoring Journal, Vol 3, No 3, p 186-189, Dec 1969. 4 p, 2 tab, 6 ref.

Descriptors: *Pesticides, *Algicides, *Irrigation canals, *Copper sulfate, Water chemistry, Sorption, Ion exchange, Pesticide residues, Pesticide kinetics, Persistence, Leaching, Infiltration.
Identifiers: Sunnyside (Wash).

Measurements of copper concentrations in water, in suspended sediment, and in bottom sediment of an irrigation canal after a copper sulfate treatment at 1 lb/cfs indicate that, after dissolution, much of the copper is sorbed by suspended sediment which gradually settles to the canal bottom. A large part of the copper in the deposited sediment is then slowly fed back into the canal water over a period of many hours. Buildup of copper in irrigated soils appears to be very minor. (Knapp-USGS)
W70-04315

THE SPREAD OF OIL SLICKS ON A CALM SEA,
Massachusetts Inst. of Tech., Cambridge. Dept. of Mechanical Engineering.
James A. Fay.
Available from Clearinghouse as AD-696 876, $3.00 in paper copy, $0.65 in microfiche. Massachusetts Institute of Technology Fluid Mechanics Laboratory Publication No 69-6, Aug 1969. 14 p, 3 fig, 2 ref.

Descriptors: *Oily water, *Oil-water interfaces, *Mathematical studies, Water pollution effects, Oil wastes, Water pollution sources, Hydraulics, Physical properties.
Identifiers: Oil-slick spreading.

The spread of oil slicks on water is analyzed mathematically and compared with field observations. Observations almost always show a rapid spread to a size which increases with volume of the spill, followed by a long period of no further growth. This behavior is ascribed to a sudden reduction of the net surface tension at a time when evaporation and dissolving of the lighter components of the oil has occurred. (Knapp-USGS)

AUTOMATIC WATER SAMPLING PROPORTIONAL TO STREAMFLOW,
Geological Survey, Washington, D.C.; and Oak Ridge National Lab., Tenn. Instrumentation and Controls Div.
P. H. Carrigan, Jr., and W. F. Johnson.
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75 per copy. Geological Survey Research 1969, Professional Paper 650-D, p D278-D282, 1969. 5 p, 5 fig, 2 ref.

Descriptors: *Water quality, *Sampling, *Monitoring, *Automatic control, Automation, Instrumentation, Radioisotopes, Radioactive wastes, Flowmeters, Waste dilution, Tracking techniques, Tracers, Dye releases.
Identifiers: Oak Ridge (Tenn), Automatic water sampling.

Low-level radioactive wastes from the Oak Ridge National Laboratory are released to the Clinch River, 2.3 miles downstream from Melton Hill Dam. Water samples proportional to river flow are composited at two stations, immediately and 8.6 miles downstream from the dam, to monitor radioactivity in the river. Sampling at the stations responds immediately to rapid changes in waste dilution owing to power releases at the dam. The sampling equipment frequently diverts aliquots of river water into a container, the duration of diversion being proportional to river flow. The flow is measured by the turbine flowmeter in the dam powerhouse and by a vane-deflection meter, developed in this study, at the respective stations. (Knapp-USGS)

Oak Ridge National Lab., Tenn. Health Physics Div.
Jerry S. Olson.
Radioecology, Vincent Schultz and Alfred W. Klement, Jr, editors, Reinhold Publishing Corp, N Y and The American Institute of Biological Sciences, Washington, D C, 1963. p 121-125. 9 fig, 9 ref.

Descriptors: *Analog models, *Analog computers, *Ecosystems, *Simulation analysis, *Computer models, Radioecology.
Identifiers: *Analog computer simulation, *Ecosystem modeling, Radionuclide movement.

Analog computers should fulfill an increasing need in the interpretation of radioecology data by providing a physical simulation of ecosystem processes. Such simulation capability offers a valuable analytic tool for resolving complicated ecological systems into their basic components. Construction of analog computer networks from ecosystem compartment models is accomplished through use of integrators, feedback potentiometers, function generators, servomultipliers, and diode-limiters. Diagrams of a simple ecosystem compartment model and its analog computer counterpart demonstrate the conversion technique. The analog computer models are as effective with nonlinear ecosystem models as they are with highly simplified linear models, thus they have advantages over other simulation tools. Analog models have been used to study transfer of carbon and radioactive carbon-14 in the ecosystem, and the same methodology can be extended to produce a variety of models for studying the transfer of fission products and mineral nutrients through ecosystems. Rostherne Mere, Cheshire, England, is a small lake with a maximum depth of about 30 meters. It is a normal dimictic eutrophic lake with a diverse benthic fauna, but the sediment in the deepest part is permanently deoxygenated and devoid of organisms other than copepods, probably in a dormant state. There is no dense layer of salt near the bottom and ammonia levels detected were not exceptionally high. The history of land-use around Rostherne Mere is not unique, and the human population is very small. The village received a piped water supply at the beginning of the century, but only sullage water reaches Rostherne Brook; three septic tanks drain into the mere, but their contribution of nutrients is negligible. Persistence of deoxygenated conditions in the sediments at the deepest part of Rostherne Mere and the associated presence of hydrogen sulfide render these sediments uninhabitable. In the absence of any significant organic pollution from human sources, this condition is attributed to deposition of feces from the very large bird population on the lake, both resident and transitory, especially the blackhead gulls (Larus ridibundus). (Jones-Wisconsin)

STUDIES ON SOME INLAND WATERS OF THE GALAPAGOS,
Wisconsin Univ., Milwaukee. Center for Great Lake Studies.
Richard Howmiller.
Ecology, Vol 50, No 1, p 72-80, 1969. 7 fig, 5 tab, 30 ref. NSF Grants GB 6870 and GB 6871.

Descriptors: *Saline lakes, *Water pollution sources, Birds, Oxygen, Nutrients, Photosynthesis, Chlorophyll, Shrimp, Fish, Lakes, Salinity.
Identifiers: *Guano, *Glapagos Islands, Ecuador, Corixids, Tanaid shrimp, Anostracan shrimp, Genovesa Island, Isabella Island, Guanotrophy.

Transparency, temperature, oxygen content, phosphorus, nitrite, nitrate, and hydrogen sulfide, pH value, salinity, plant pigments, and chlorophyll were determined in two large hypersaline lakes and three small ponds of lesser salt concentration in the Galapagos Islands. One of the lakes--Arcturus--is enriched in nutrients and organic matter by bird manure and presents an example of 'guanotrophy.' Another lake--Tagus Crater--has a rock salt bottom. Both lakes lack fish and their fauna is dominated by corixids and tanaid or anostracan shrimps. The ponds, in spite of their minute size (about 1/4 acre) harbor several species of fish. The study provides a transect-like picture of the influence of salinity and excessive content or organic fertilizer on physico-chemical features of water and survival of life forms. (Wilde-Wisconsin)
W70-04453

EFFECTS OF DAM CONSTRUCTION ON TEMPERATURES OF COLUMBIA RIVER,
Battelle-Northwest, Richland, Wash.
R. J. Jaske, and J. B. Goebel.
Journal American Waterworks Association, Vol. 59, p. 935-942, August 1967. 4 fig., 4 tab., 5 ref.

Descriptors: *Columbia River, *Thermal pollution, Data collections, Grand Coulee Dam, Ecology, *Temperature, Statistical models, Environmental effects, Dams, Dam construction, Reservoirs, Impoundments.
Identifiers: *Environmental model, Hybrid analog-digital computer, Temperature prediction, Lake Roosevelt, Rock Island Dam, Rocky Reach Dam, Travel time.

To evaluate the results of the program to reduce the temperature of the Columbia River to minimize the impact of powerplant operations, a system of data collection points was installed. The resulting data have been used to develop an environmental model, least square functional, which, with the use of a hybrid analog-digital computer, is capable of predicting temperature and associated water quality variables. Resulting data on stream and reservoir temperatures are presented. It was found that the erection of low-head reservoirs on the main stem of the Columbia River has not produced significant change in the average temperature of the river. The erection of Grand Coulee Dam on Lake Roosevelt

has resulted in a 30 day delay in the transport of water through the reservoir system. The erection of dams and reservoirs decreases expected variance in the water temperatures. The ecological effect of Columbia River impoundments is not comparable in size to large storage projects. (Rietveld-Vanderbilt)

Descriptors: *Water temperature, *Mathematical models, Air temperature, Climatology, Evaporation, *Heat balance, Heat transfer, Thermal pollution, Energy budget, Thermal radiation, Specific heat, Thermal properties, Convection, Pollutants, Heat flow, Thermal powerplants, Solar radiation, Electromagnetic waves, Streams, Lakes, Environmental effects, *Temperature.
Identifiers: Heat conductivity, Equilibrium temperature.

A mathematical model of stream temperature as a function of time and downstream distance was derived based on the approximately linear response of the stream to a 'temperature input function' T sub epsilon (t). The actual non-linear properties of the mechanism were demonstrated, and the necessary linear approximations in certain of the heat budget terms were developed. Independent expressions were given for T sub epsilon (t) and the exchange coefficient lambda, which permit their calculation from observations of climatological variables. The model was given a limited test to confirm the basic concept and verify expressions for T sub epsilon (t) and lambda. The expressions were tentatively shown to be satisfactory. The model was used to predict 19 hourly temperatures in a small stream, using one method, and 13 monthly average temperatures for a large lake, using another method, with moderate accuracy. The latter method was based solely on observed climatological variables. The model was shown to be useful in estimating downstream temperatures below a waste heat discharge and below the release of stored water in low-flow augmentation. (Novotny-Vanderbilt)

DISTRIBUTION OF NITRATES AND OTHER WATER POLLUTANTS UNDER FIELDS AND CORRALS IN THE MIDDLE SOUTH PLATTE VALLEY OF COLORADO,
Agricultural Research Service, Fort Collins, Colo. Northern Plains Branch; and Colorado Agricultural Experiment Station, Fort Collins.
B. A. Stewart, F. G. Viets, Jr., G. L. Hutchinson, W. D. Kemper, and F. E. Clark.
U S Department of Agriculture, Agricultural Research Service, ARS 41-134, December 1967, 206 p. 31 fig, 25 tab, 13 ref.

Descriptors: *Nitrates, *Ammonia, *Water pollution sources, *Cores, Fields, Plants, Alfalfa, Cereal crops, Irrigated land, Colorado, Groundwater, Percolation.
Identifiers: Native grasses, Feedlots, Corrals, South Platte Valley (Colo).

Cores representing nonirrigated fields in native grass, cultivated nonirrigated fields, irrigated fields in alfalfa, irrigated fields in crops other than alfalfa, and corrals were obtained from northeastern Colorado during 1966. Cultivated nonirrigated fields usually contained small accumulations of nitrate below the root zone. Native grass fields, ordinarily, did not show nitrate accumulation in core profiles. Significant quantities of nitrate were found in most cores from irrigated fields with row crops or cereal grains. Alternately, cores from irrigated alfalfa fields generally contained insignificant amounts of nitrate. Amounts of nitrogen as nitrate found under corrals were extremely varied, ranging from almost none to more than 5000 pounds/acre in a 20-foot profile. Evidence disclosed that denitrification was occurring under feedlots, even at several feet below the surface, consequently, much of nitrate under feedlots will probably never reach the water table. Water samples beneath several corrals contained large amounts of organic carbon and ammonia and possessed offensive odor. Bacterial counts under corrals were considerably higher than under other areas, especially at lower depths. These findings indicate some pollution of groundwater by deep percolation is occurring from corrals, but more studies are required before significance and magnitude of this pollution can be assessed. VERTICAL AND HORIZONTAL DISTRIBUTION OF PHYTOPLANKTON IN QUABBIN RESERVOIR,
Massachusetts Univ., Amherst. Water Resources Research Center.
Paul A. Erickson, and John T. Reynolds.
Available from the Clearinghouse as PB-189 765, $3.00 in paper copy, $0.65 in microfiche. Interim Report, Massachusetts Water Resources Research Center, Publication No 9, Dec 1969. 44 p, 19 fig, 4 append. OWRR Project B-006-MASS.

Descriptors: *Phytoplankton, *Eutrophication, Reservoirs, Planning.
Identifiers: Microbial population patterns.

Phytoplanktonic data collected incidentally to the aims of the studies on eutrophication in Quabbin Reservoir are a significant addition to the knowledge of the characteristic phytoplankton in this major Massachusetts' Reservoir. Four distinct areas are defined in terms of the horizontal and vertical distribution of three types of phytoplankton, and these areas seem to correspond to subdivisions of the reservoir which can be made on the basis of other physical and chemical data. While such areas may or may not prove to be of general ecological significance in the light of more exhaustive studies, even preliminary evidence of consistent phytoplanktonic differences throughout the reservoir might help to define the aims and direct the efforts of any future study of eutrophication in Quabbin. Information on such differences is particularly important today because diversions of water into Quabbin from polluted sources such as the Connecticut River are being contemplated, and because the basis for a measurement of the efficiency and effect of treatment plants constructed as part of those diversions will be a knowledge of microbial population patterns in Quabbin prior to the mixing.

STUDIES ON THE POPULATION DYNAMICS AND PHYSIOLOGICAL ECOLOGY OF FOUR SPECIES OF FRESH-WATER ISOPODS,
Illinois Univ., Urbana. Water Resources Center.
Arthur J. Seidenberg.
Available from the Clearinghouse as PB-189 792, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Illinois Water Resources Center, Research Report No 27, Jan 1970 69 p, 6 tab, 24 fig, 85 ref. OWRR Project A-018-ILL.

Descriptors: Isopods, Fish parasities
Identifiers: Parasite, Asellus, Lirceus, Acanthocephalus, Thermal tolerance, Pollution fauna, Population dynamics, Host-parasite relationships.

The comparative biology of four species of freshwater isopods has been investigated. Isopods are known to be part of the 'pollution fauna' that can inhabit badly polluted areas. The species studies inhabit a temporary pond, a drainage ditch, a small permanent stream, and the subterranean water, all relatively undisturbed areas. Their tolerance to high temperature and survival out of water, growth rates, and duration of embryonic development have been investigated and differences among the species have been suggested to be adaptive for the particular population under study. The general population biology of these species was studies including their life cycles and general ecology. The 'basic biology' reported for these organisms will allow investigators to assess more clearly the effects of man-made disturbances on these aquatic organisms. One of the species studied was found to be an intermediate host of a worm that is a fish parasite. The host-parasite relationships between the worm and the isopod were also investigated. Fish acquire the parasite after eating the isopod. The isopod population was found to be very heavily infected (up to 65%) with these worm larvae. The larvae cause the isopods to lose weight and produce a mortality in heavily infected isopods. This means a drastic reduction in the amount of isopod food available to fish.

CHEMISTRY OF NITROGEN AND PHOSPHORUS IN WATER,
P. L. McCarty.
Journal American Water Works Association, Vol 62, No 2, p 127-140, Feb 1970. 14 p, 6 fig, 8 tab, 64 ref.

Descriptors: *Nutrients, *Eutrophication, *Water quality control, *Nitrogen compounds, *Phosphorus compounds, Algae, Nutrient requirements, Productivity, Essential nutrients, Water quality, Water chemistry, Cycling nutrients.
Identifiers: Nitrogen requirements (Algae), Phosphorus requirements (Algae), Nutrient chemistry (Aquatic).

Of the major elements essential to algal growth, nitrogen and phosphorus are the ones most likely to be of critically limiting availability in natural waters. Because they therefore represent promising weak links in algal life cycles, their chemical states and behavior in water are examined to see how water treatment might benefit. Large supplies of nitrogen and phosphorus are present in many bodies of water either in the sediments, the atmosphere above, or in the form of dissolved gas. These forms may be available for the growth of algae and other aquatic plants, but the rates at which they may become available is slow. These rates are important, however, as they tend to control the amount of vegetative growth which can be supported. Soluble nitrogen and phosphorus contained in the effluents from waste treatment plants, on the other hand, are in a readily available form. If discharged to natural bodies of water, they can stimulate growth far in excess of that which would occur naturally. (Knapp-USGS)
W70-04080

DEFORMATION OF DEVELOPING EMBRYOS OF SEA URCHINS WITH CHANGES IN THE IONIC ENVIRONMENT,
McGill Univ., Montreal (Quebec). Dept. of Zoology.
N. Wolfson.
Canadian Journal of Zoology, Vol 47, No 6, p 1363-1365, 1969. 4 fig, 16 ref.

Descriptors: *Deformation, *Environmental effects, Embryonic growth stage, Sodium chloride, Calcium.
Identifiers: *Paracentrotus lividus, *Embryonic development, *Abnormal development, Ionic environmental changes, Fertilization membranes, Blastulae, Speudopods, Ameboid transformations.

Embryos of Paracentrotus lividus, deprived of their fertilization membranes and exposed for periods of 10-120 min to cold buffered isotonic NaCl at various cleavage stages, will often exhibit pseudopodial extensions of the external surface of blastomeres still in embryonic association. Similarly treated embryos allowed to develop for 1-2 days in seawater will often fuse to produce large monsters with continuous blastocoels. Photographs of living embryos displaying blastomeric pseudopods and multiembryonic fusion are presented. The exposure of embryos to artificial saline may promote losses of calcium, of hyaline layer, and perhaps of other superficial components, some of which are reversible losses and others not, after return to seawater. (Katz and Sjolseth-Washington)
W70-04144

A CHEMICAL SELECTIVELY LETHAL TO SQUAWFISH (PTYCHOCHEILUS OREGONENSIS AND P. UMPQUAE),
Idaho Univ., Moscow.
Craig MacPhee, and Richard Ruelle.
Contract with the Columbia River Fishery, Development Program, Bu. of Commercial Fisheries, U.S. Fish and Wildlife Service. Transactions of the American Fisheries Society, Vol 98, No 4, p 676-684, Oct 1969. 6 tab, 3 fig, 9 ref.

Descriptors: *Fish control agents, *Bioassay, *Resistance, *Selectivity, Fish management, Toxicity, Salmonids, Mortality, Public health.
Identifiers: *Squawfish, Ptychocheilus oregonensis, Ptychochelus umpqua, *1-1'-methlenedi-2-naphthol, *Water temperature effects, *Tolerance.

A piscicide, 1,1'-methylenedi-2-naphthol, is lethal to Ptychocheilus oregonensis and P. umpqua at concentrations of 3 to 100 times more toxic to squawfish than to salmonids. Selectivity of the chemical varies with the tolerances of the species and its potency varies positively with concentration and temperature. For a thermal range of 18.3 to 10.0 C, the minimum LC sub 100 is .006 to 0.014 ppm for P. oregonensis and 0101 to 0103 ppm for P. umpquae. Within these ranges the mean survival time varies from 6 to 31 hr for P. oregonensis and 6 to 20 hr for P. umpquae. In 96 -hour assays at similar temperature, the maximum LC sub 0 is about 0.3 ppm for Salvelinus fontinalis, 0.1 ppm for Oncorhynchus tshawytscha, and from 0.6 to 1.3 ppm for O. kisutch and Salmo gairdneri depending on the water temperature. One domestic sheep and two ducks showed no ill effects when forced to drink water containing 10 ppm of the chemical for 1 week. A field application in a small lagoon containing several species of fish killed only P. oregonensis. (Katz and Sjolseth-Washington)
W70-04145

OXYGEN CONSUMPTION OF ENDRIN-SUSCEPTIBLE AND ENDRIN-RESISTANT GAMBUSIA DURING SUBLETHAL AND ACUTE ENDRIN EXPOSURE,
Mississippi State Univ., State College.
Charm R. McIngvale, Larry Ludke, and Denzel E. Ferguson.
Journal of the Mississippi Academy of Sciences, Vol XIV, 1968. Reprint, 6 p, 3 fig, 6 ref. US Public Health Service Grants ES-00086 and UI-00348.

Descriptors: *Endrin, *Respiration, Oxygen requirements, Resistance, Chlorinated hydrocarbon pesticides.
Identifiers: *Oxygen consumption, Mosquitofish, Gambusia affinis, Endrin-resistance, Susceptible mosquitofish.

The rate of oxygen consumption of endrin-resistant mosquitofish, Gambusia affinis, was significantly lower (26%) than that of a susceptible strain. Susceptible individuals showed an increase in rate of oxygen uptake with the onsent of poisoning symptoms, followed by a decrease prior to death. Resistant fish exhibited no consistent change in rate of oxygen consumption in endrin. When susceptible fish were subjected for 3 hours to 0.1, 2.0, and 10.0 ppb endrin, none died and oxygen uptake fell below the control group, but only the 0.1 ppb data differed significantly. At higher concentrations of exposure (20 and 75 ppb) the total oxygen consumed by susceptible fish decreased significantly from the control group. Total oxygen consumed over a 3 hour test period and average rate of uptake of resistant mosquitofish did not differ significantly between the control and treated groups. (Katz and Sjolseth-Washington)
W70-04146

RESPONSE OF THE GLOBIFEROUS PEDICELLARIAE TO INORGANIC SALTS IN THREE REGULAR ECHINOIDS,
Newcastle-upon-Tyne Univ. (England). Dove Marine Lab.
Fu-Shiang Chia.
Ophelia, Vol 6, p 203-210, July 1969. 3 fig, 20 ref.

Descriptors: *Inorganic compounds, *Copper sulfate, Potassium compounds, Venoms, Mode of action.
Identifiers: *Pedicellariae, *Echinodermata, *Inorganic salts, *Activation, *Avoidance responses, Echinus esculentus, Zinc salts, Potassium chloride, Potassium sulfate, Psammechinus miliaris, Strongylocentrotus droebachiensis, Response, Starfishes.

The globiferous pedicellariae of Echinus esculentus (L.), Psammechinus miliaris (Gmelin) and Strongylocentrotus droebachiensis (O.F.M.) may be activated by a number of inorganic salts such as ZnCl2, ZnSO4, CuCl2, CuSO4, KCl, and K2SO4, even at great dilutions; the reaction is similar to that evoked by predatory starfishes. The discharge of venom may also be induced by potassium salts both in situ as well as with isolated pedicellariae. In all three species, the venom discharges through the fang-like tooth via a small opening located in a subterminal position. The venom apparatus functions as a hypodermic syringe which injects the venom directly into the wound. After discharge, the pedicellaria breaks away from the test at the base of the stalk (autotomy). In Psammechinus, it takes 25 days to regenerate a new and functional pedicellaria. (Katz and Sjolseth-Washington)

PESTICIDE TOLERANCES OF SELECTED FRESHWATER INVERTEBRATES,
Mississippi State Univ., State College.
Syed M. Naqvi, and Denzel E. Ferguson.
Journal of the Mississippi Academy of Sciences, Vol XIV, 1968. Reprint, 7 p, 4 tab, 6 ref. US Public Health Service Grants ES-00086 and UI-00348.

Descriptors: *Chlorinated hydrocarbon pesticides, *Organophosphorus pesticides, *Pesticide toxicity, *Bioassays, *Copepods, DDT, Endrin, Aldrin, Dieldrin, Mortality, Snails, Clams, Tubificids, Resistance, Food pyramids.
Identifiers: *Physa gyrina, *Tolerances, Chlordane, Lindane, Malathion, Phosdrin, Toxaphene, Parathion, Eupera singleyi, Tubifex tubifex, Belzoni (Miss), State College (Miss).

In a 48-hr exposure to various concentrations of nine insecticides, six species of cyclopoid copepods from a pesticide contaminated ditch near Belzoni, Mississippi, displayed higher tolerances than did the same species from areas of minimal pesticide contamination near State College, Mississippi. Similarly, a clam, Eupera singleyi, and a snail, Physa gyrina, from the Belzoni locality had higher tolerances to endrin and toxaphene than the same species from near State College. Extremely high concentrations of 20 insecticides failed to kill the worm Tubifex tubifex, from Belzoni in 72-hr tests. The potential effect of increased tolerances in these invertebrate species is to increase the amount of pesticide residues available to higher trophic levels. (Katz and Sjolseth-Washington)

A LIMNOLOGICAL STUDY OF THE LOWER FARMINGTON RIVER WITH SPECIAL REFERENCE TO THE ABILITY OF THE RIVER TO SUPPORT AMERICAN SHAD,
Connecticut Univ., Storrs. Dept. of Fisheries.
Walter R. Whiteworth, and David H. Bennett.
Institue of Water Resources, University of Connecticut, Rept No 9, Feb 1970. 57 p, 29 tab, 7 fig, 26 ref. Supported in part by the Connecticut Research Commission (Grant No RSA 66-5).

Descriptors: *Limnology, *Bioassay, *Water pollution effects, *Effluents, Aquatic environment, Biological properties, Chemical properties, Biochemical oxygen demand, Plankton, Zooplankton, Sampling, Hydrogen ion concentration, Community development, Metabolism, Ecological distribution, Water temperature, Heavy metals, Oxygen requirements, Industrial waste.
Identifiers: *Alosa sapidissima, *Lead, American shad, Farmington River, Connecticut, Connecticut River, Colonization, Community metabolism, Bottom fauna.

Fish, plankton, bottom fauna, and water were sampled in the Lower Farmington River as part of a comprehensive limnological survey. Water temperature, B.O.D., rate of slide colonization tests, estimates of community metabolism and effects of effluents were studied. Laboratory and field bioassays using various fish were conducted with effluents common to the Farmington River. The effects of fluctuating DO levels on hatching of shad eggs were studied. Shad were transferred into the River and from the data collected the authors conclude that the River is capable of supporting a significant shad run, and should not be measurably affected by the effluent discharge. A set of 5 recommendations concerned with building the shad runs is presented. (Katz and Sjolseth-Washington)
W70-04150

EFFECT OF FEEDING AND OF DDT ON THE ACTIVITY OF HEPATIC GLUCOSE 6-PHOSPHATE DEHYDROGENASE IN TWO SALMONIDS,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
Donald R. Buhler, and P. Benville.
Journal Fisheries Research Board of Canada, Vol 26, No 12, p 3209-3216, 1969. 5 tab, 27 ref.

Descriptors: *DDT, *Enzyme, *Fish physiology, Rainbow trout, Fish diets, Chlorinated hydrocarbon pesticides, Pesticide toxicity.
Identifiers: *Insulin, *Hepatic enzymes, Enzyme activity, Coho salmon, Starvation, Liver size.

The specific activity of liver glucose 6-phosphate dehydrogenase in yearling rainbow trout remained unchanged when the fish were starved for periods as long as 8 weeks and when starved animals were fed diets of various compositions. Injection of insulin concurrently with refeeding also failed to alter the specific activity of the enzyme in trout. Ingestion of the pesticide DDT by juvenile coho salmon or adult rainbow trout also had no effect on the specific activity of liver glucose 6-P dehydrogenase and DDT failed to inhibit the rainbow trout enzyme in vitro. These results also differ considerably from those found in higher animals. These results suggest that the glucose 6-P

dehydrogenase enzyme in teleosts may be under a different type of regulatory control from that found in mammals. (Sjolseth-Washington)
W70-04151

ACUTE TOXICITIES OF INSECTICIDES TO MARINE DECAPOD CRUSTACEANS,
Bureau of Sport Fisheries and Wildlife, Highland, N.J. Fish-Pesticide Research Lab.
Ronald Eisler.
Crustaceana, Vol 16, Part 3, p 302-310, 1969. 4 fig, 3 tab, 20 ref.

Descriptors: *Bioassay, *DDT, *Pesticide toxicity, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Endrin, Aldrin, Heptachlor, Dieldrin, Salinity, Water temperature, Resistance, *Crustaceans.
Identifiers: *Malathion, *Methyl parathion, DDVP, Palaemonetes vulgaris, Crangon septemspinosa, Pagurus longicarpus, LC 50.

The concentrations of seven chlorinated hydrocarbon pesticides (aldrin, dieldrin, endrin, heptachlor, lindane, methoxychlor, and DDT) and 5 organophosphorus pesticides (DDVP, Delnav, phosdrin, malathion, and methyl parathion) that kill 50 percent of 3 decapod crustaceans (grass shrimp, sand shrimps and hermit crabs) during a 96 hour period were determined at different temperatures and salinities. Sand shrimp are the most sensitive to all insecticides. Of the chlorinated hydrocarbons, heptachlor is the least toxic to all species (96 hr, LC-50 range of 8 ug/l for sand shrimp to 440 ug/l for grass shrimp) and DDT about the most toxic (96 hr, LC-50 range of 0.6 ug/l for sand shrimp to 6 ug/l for hermit crabs). Of the organophosphorus pesticides, methyl parathion is the most toxic (96 hr, LC-50 range of 2-7 ug/l) and Delnav or malathion the least toxic (96 hr, LC-50 range of 33-285 ug/l). Temperature and salinity profoundly affect the mortality. Mortality among shrimp was least at 10 deg and highest at 30 deg C and intermediate at intermediate temperatures for all insecticides. The effect of salinity varied among the insecticides. (Sjolseth-Washington)
W70-04152

TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
Agricultural Chemical Inspection Station, Tokyo (Japan).
Yasushiro Nishuichi, and Yasushi Hashimoto.
English summary - Tables in English. Scientific Pest Control, BOTYU-KAGAKU, Vol 32, I. The Institue of Insect Control, Kyoto University, p 5-11, Feb 1967. 5 tab, 3 fig, 7 ref.

Descriptors: *Pesticide toxicity, *Bioassay, *Organophosphorus pesticides, *Chlorinated hydrocarbon pesticides, *Carbamate pesticides, *Solvents, Fungicides, Herbicides, Lethal limit.
Identifiers: *Organomercuric compounds, *Organotin compounds, *Organosulfuric fungicides, Cyprinus carpio, Daphnia, Oryzias latipes, Median tolerance limits, Susceptibility.

Toxicities of seventy-six kinds of pesticide ingredients to three kinds of fresh water fishes and two kinds of fresh water daphnids were evaluated. The test organisms are Cyprinus carpio, C. auratux, Oryzias latipes, and Moina macrocopa. In general, organophosphorus compounds are less toxic to fresh water fishes, while these are remarkably toxic to daphnids. Chlorinated hydrocarbon compounds are remarkably toxic to the fishes, but not so toxic to daphnids. An exception is Thiodan, which is remarkably toxic to both fishes and daphnids. Carbamate insecticides are non-toxic to fishes, but specifically toxic to daphnids. Organomercuric and organotin compounds are remarkably toxic to both fishes and daphnids. Organoarsenic fungicides are low toxicity to both fishes and daphnids. Organosulfuric and the other synthetized fungicides tested are highly toxic to fishes, but not so toxic to daphnids. Herbicides are generally non-toxic to both fishes and daphnids, but some of them are toxic. Fresh water fishes and daphnids are clearly different in susceptibility to pesticides. A considerably high correlation is recognized between the susceptibility of Cyprinus carpio and C. auratus, and between Daphnia pulex and Moina macrocopa. Orizias latipes is selectively susceptible to some kinds of pesticide ingredients. (Sjolseth and Katz-Washington)
W70-04153

LETHAL EFFECTS OF 1888 CHEMICALS UPON FOUR SPECIES OF FISH FROM WESTERN NORTH AMERICA,
Idaho Univ., Moscow. Coll. of Forestry-Wildlife and Range Sciences.
Craig MacPhee, and Richard Ruelle.
Contract with the Columbia River Fishery Development Program, Bu of Comm Fish, US Fish and Wildlife Service. Forest, Wildlife and Range Experiment Station, Bull No 3, Univ of Idaho, College of Forestry - Wildlife and Range Sciences, Nov 1969. 112 p, 4 tab, 2 ref.

Descriptors: *Bioassay, Chinook salmon, Rainbow trout, *Lethal limit, Mortality, *Toxicity, Pollutants, *Toxins, Wastes.
Identifiers: Equilibrium loss, Coho salmon, Steelhead, Northern squawfish.

A piscicide screening program was conducted with 1,888 different chemicals mostly at concentrations of 10 ppm. The times at which fish lost their equilibrium and died are given for 2,552 separate 24-hour assays. The species tested were the northern squawfish (Ptychocheilus oregonensis) chinook salmon (Oncorhynchus tshawytscha), coho salmon (Oncorhynchus kisutch) and steelhead (Salmo gairdneri). (Sjolseth and Katz-Washington)
W70-04154

EFFECTS OF THE INSECTICIDE SEVIN ON SURVIVAL AND GROWTH OF THE COCKLE CLAM CLINOCARDIUM NUTALLI,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
Jerry A. Butler, Raymond E. Millemann, and Nelson E. Stewart.
Supported by Public Health Service Research Grant CC-00303 from the National Communicable Disease Center, Atlanta, Ga. Journal Fisheries Research Board of Canada, Vol 25, No 8, p 1621-1635, 1968. 6 tab, 2 fig, 22 ref.

Descriptors: *Carbamate pesticides, *Growth rates, *Bioassay, Pesticide toxicity, Clams, Animal control, Pesticide residues, Mortality, Water temperature, Pesticide removal.
Identifiers: *Sevin, *1-naphthol, *Food consumption, Food conversion efficiency, Survival, Clinocardium nutalli.

Experiments are reported on the effects of the insecticide Sevin and its hydrolytic product, 1-naphthol, on the survival, growth, and food consumption of larval and juvenile cockle clams (Clinocardium nuttalli). Toxicant concentrations ranged from 0.1 to 10.0 mg/liter. Larvae exposed to Sevin concentrations of 0.8 mg/liter were dead by day 7 of the test, and the growth of those exposed to 0.4 mg/liter was reduced by 15%. Sevin was less toxic than 1-naphthol to juvenile clams, the respective 96-hr TL's (median tolerance limits) being 3.75 and 2.70 mg/liter. The growth of juvenile clams was reduced more by 1-naphthol than by Sevin. The food consumption of juvenile clams exposed to 1.6 mg/liter of Sevin was markedly reduced and their food conversion efficiency was impaired. Adult clams exposed to Sevin concentrated the toxicant in their tissues; maximum concentrations were reached after 12 hr of exposure. Clams exposed at 11 C concentrated more toxicant than those exposed at 20 C. Tissue concentrations of toxicant decreased sharply after the clams had been in clean sea water for 12 hr. (Sjolseth and Katz-Washington)

BIOLOGICAL EFFECTS OF THERMAL DISCHARGES: ANNUAL PROGRESS REPORT FOR 1968,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
W. L. Templeton, C. D. Becker, J. D. Berlin, C. C. Coutant, and J. M. Dean.
Reprinted from Pacific Northwest Laboratory Annual Report for 1968 to USAEC Division of Biology and Medicine, Volume I: Life Sciences. USAEC Research and Development Report No BNWL-1050, Dec 1969. 49 p.

Descriptors: *Thermal pollution, *Thermal stress, Water pollution effects, *Salmoids, *Columbia River, *Fish physiology, Fishkill, Nuclear reactors, Water temperature, Fish behavior.
Identifiers: Thermal resistance, Thermal shock, Thermal tolerance.

This is the second annual report issued by Battelle-Northwest's Aquatic Ecology Section which deals exclusively with research to determine the effects of thermal additions to aquatic environments. The individual papers, all separately abstracted, include the following titles: Responses of Salmonid Fishes to Acute Thermal Shock, Passage of Downstream Migrants, Chinook Salmon Spawning Ner Hanford - 1968, Gull Predation in a Reactor Discharge Plume, Effects of Chronic Variable Water Temperature on Survival and Growth of Young Chinook Salmon, Behavior of Sonic-Tagged Chinook Salmon and Steelhead Trout Migrating Past Hanford Thermal Discharges, The Food and Feeding of Juvenile Chinook Salmon in the Columbia River at Hanford, Columnaris Exposure and Antibody Development Among Upstream Migrant Salmonids, Oral Immunization of Juvenile Coho Salmon Against Chondrococcus Columnaris, The Response of Juvenile Salmonids to Acute Thermal Shock, and Alterations in Hepatocyte Function of Thermally Acclimated Rainbow Trout (Salmo Grirdneri). (See also W70-04158 thru W70-04163).
W70-04157

RESPONSES OF SALMONID FISHES TO ACUTE THERMAL SHOCK,
Battelle-Northwest, Richland, Wash.
C. C. Coutant.
In Biological Effects of Thermal Discharges: Annual Progress Report for 1968, p 1-8, Dec 1969. 6 fig, 2 tab, 1 ref.

Descriptors: *Thermal pollution, *Thermal stress, *Fishkill, Rainbow trout, Chinook salmon, Salmonids, Equilibrium, Water temperature, Mortality, Resistance, Fish predation, Fish behavior, Columbia River, Nuclear reactors.
Identifiers: *Thermal shock, *Thermal resistance, Coho salmon, Hanford Atomic Works.

Chinook salmon, coho salmon, and rainbow trout were subjected to acute thermal shock in order to determine any relationships between times to equilibrium loss and death of fish populations. There is a variation with test temperature in the relationship between times to equilibrium loss and death in juvenile chinook salmon and rainbow trout. Chinook salmon and rainbow trout undergo increased predation at sublethal exposures to lethal temperature. Equilibrium loss due to thermal shock is not reversible at all lethal temperatures, for the studies show large delayed mortality of rainbow trout 24 hours after exposure to 27-30 deg C. Above 30 deg C equilibrium loss is reversible. Thermal resistance differences between juvenile and large coho and chinook salmon in addition to species differences were found. Above 28 deg C juvenile chinook are most sensitive, then juvenile

coho, adult coho and adult chinook and below 28 deg C it is adult coho, juvenile chinook and juvenile coho the least sensitive. (See W70-04157). (Sjolseth-Washington)
W70-04158

PASSAGE OF DOWNSTREAM MIGRANTS,
Battelle-Northwest, Richland, Wash.
C. C. Coutant, C. D. Becker, and E. F. Prentice.
Biological Effects of Thermal Discharges: Annual Progress Report for 1968, p 9-12, Dec 1969. 2 fig, 1 tab.

Descriptors: *Thermal pollution, *Thermal stress, *Acclimatization, Chinook salmon, Fishkill, Equilibrium, Water temperature, Columbia River, Mortality, Nuclear reactors.
Identifiers: *Thermal resistance, *Thermal shock, Hanford Atomic Works.

Juvenile chinook salmon were confined to live boxes which were drifted through reactor discharge plumes below Hanford on the Columbia River. No direct or 24 hour latent mortalities were induced during spring and summer. Shoreline areas affected by intragravel seepage of heated water reached lethal levels for chinook. In these area losses of test fish during mid-summer occurred. Most temperature rises did not exceed the ultimate incipient lethal level for the species. Emigrating juvenile chinook trapped in May following passage through the warmest part of the thermal discharge plume showed no mortality, equilibrium loss or 'gas bubble' disease. The authors feel that most emigrating juvenile salmon are successful in passing areas of maximum thermal change at Hanford. (See W70-04157). (Sjolseth-Washington)
W70-04159

EFFECTS OF CHRONIC VARIABLE WATER TEMPERATURES ON SURVIVAL AND GROWTH OF YOUNG CHINOOK SALMON,
Battelle-Northwest, Richland, Wash.
P. A. Olson, and R. E. Nakatani.
Biological Effects of Thermal Discharges: Annual Progress Report for 1968, p 17-20, Dec 1969. 1 fig, 1 tab.

Descriptors: *Fishkill, *Fish eggs, *Thermal pollution, *Growth rate, Chinook salmon, Columbia River, Spawning, Mortality, Thermal stress, Resistance, Nuclear reactors.
Identifiers: *Thermal resistance, Hanford Atomic Works.

Fertilized eggs from five pairs of chinook salmon were taken and exposed to six different temperature regimes following the Columbia River's seasonal pattern and expressing different heating rates on a cumulative weekly basis during early development. A constant temperature increment above base river temperatures of 2.5 deg C caused slightly increased egg mortalities. An eventual 5 deg C increment above base river temperatures produced no increased mortality in the majority of spawns when added by 20 cumulative weekly increments of 0.25 deg C, although increased mortality occurred if this 5 deg C rise was done at 0.5 deg C for 10 weeks. It was noticed that warmer water condtions resulted in increased growth rates. (See W70-04157). (Sjolseth-Washington)

BEHAVIOR OF SONIC-TAGGED CHINOOK SALMON AND STEELHEAD TROUT MIGRATING PAST HANDFORD THERMAL DISCHARGES,
Battelle-Northwest, Richland, Wash.
C. C. Coutant.
Biological Effects of Thermal Discharges: Annual Progress Report for 1968, p 21-26, Dec 1969. 1 tab, 2 fig.

Descriptors: *Thermal pollution, *Fish behavior, *Fish migration, Chinook salmon, Rainbow trout, Columbia River, Nuclear reactors, Thermal stress, Water temperature, Distribution patterns, Tagging.
Identifiers: *Steelhead trout, *Sonic fish tags, Hanford Atomic Works, Migration rates.

Eighty-nine chinook salmon and 279 steelhead were marked with sonic tags to determine their pathways of spawning migrations as they move through the warm waters surrounding the Hanford facilities. The fish were found to migrate mainly along the shoreline, principally utilizing the left bank opposite the reactors during peak river temperatures. No statistical difference was found between migration rates of the two species or between rates along shorelines inside and outside the reactors' thermal influence. Average migration rates were studied and found to be distinctly nonuniform. The authors feel there is insufficient data available to identify the causes of anomalies in distribution and migration rate. (Sjolseth-Washington)
W70-04161

THE FOOD AND FEEDING OF JUVENILE CHINOOK SALMON IN THE COLUMBIA RIVER AT HANFORD,
Battelle-Northwest, Richland, Wash.
D. C. Becker.
Biological Effects of Thermal Discharges: Annual Progress Report for 1968, p 27-31, Dec 1969. 1 tab, 1 fig, 2 ref.

Descriptors: *Fish diets, *Aquatic insects, *Thermal pollution, Chinook salmon, Columbia River, Nuclear reactors, Water temperature.
Identifiers: *Feeding activity, *Fish stomach contents, Hanford Atomic Works, Terrestrial insects, Chironomids.

Stomach contents of 445 young chinook salmon taken near Hanford were examined. They fed primarily upon aquatic insects, mainly chironomids, and secondarily on terrestrial insects. No evidence was found to suggest that heated effluents discharged in midwater plumes and which rapidly mix with the colder river water adversely affects either insect production or feeding activity of fish. Food intake was restricted in a few shoreline areas receiving warm water via intragravel seepage. The author feels that thermal discharge to the river, when waters are below preferred levels during spring runoff, may actually benefit the fish. (Sjolseth-Washington)
W70-04162

THE RESPONSE OF JUVENILE SALMONIDS TO ACUTE THERMAL SHOCK,
Battelle-Northwest, Richland, Wash.
J. M. Dean.
Biological Effects of Thermal Discharges: Annual Progress Report for 1968, p 41-46, Dec 1969. 2 tab, 3 fig.

Descriptors: *Thermal stress, *Acclimatization, *Fish behavior, *Mortality, Chinook salmon, Salmonids, Water temperature, Thermal pollution, Fishkill, Resistance, Fish physiology.
Identifiers: *Thermal shock, *Thermal tolerance, Coho salmon, Muscle temperature.

Juvenile coho and chinook salmon were acclimated at 10, 15, or 20 deg C and transferred in lots of ten to water temperatures of 25-30 deg C. Temperature acclimation will shift the thermal limits of behavioral and physiological responses. The absolute limits differed for various species of salmonids but the overall response was similar. The author stressed the need for more observations of the reactions of organisms to thermal stress so that adequate thermal criteria can be established. (Sjolseth-Washington)
W70-04163

PERSISTENCE OF CARBARYL IN THE MARINE ESTUARINE ENVIRONMENT. CHEMICAL AND BIOLOGICAL STABILITY IN AQUARIUM SYSTEMS,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife; and Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
J. F. Karinen, J. G. Lamberton, N. E. Stewart, and L. C. Terriere.
Journal of Agricultural and Food Chemistry, Vol 15, p 148-156, Jan-Feb 1967. 2 tab, 5 fig, 16 ref. US Public Health Service Research Grant 5 RO1 EF 00628-02.

Descriptors: *Persistence, *Carbamate pesticides, *Estuarine environment, *Degradation, Carbon radio isotopes, Pesticide removal, Hydrolysis, Pest control, Mud flats, Colorimetry, Stability, Absorption.
Identifiers: *Sevin, *1-naphthol, *Carbaryl, Radiometric analyses.

Colorimetric and radiometric analyses were used to study the persistence of carbaryl in estuarine water and mud in laboratory aquaria held at two temperatures. In the absence of mud, the carbaryl concentration decreased approximately 50% in 38 days at 8 deg C. Most of this decrease was accounted for by the production of 1-naphthol. At 20 deg C after 17 days, the carbaryl had almost completely disappeared, with 43% converting to 1-naphthol. When mud was present, both carbaryl and 1-naphthol declined to less than 10% in the sea water in 10 days. Both compounds were adsorbed by the mud, where decomposition continued at a slower rate. Radioactive carbon dioxide was produced in the aquaria containing 14C carbonyl-labeled and 14C ring-labeled carbaryl, indicating decomposition by hydrolysis of the carbamate and oxidation of the naphthyl ring. The total recovery of the 14C activity was only 40%. It is postulated that much of the remainder was evolved as methane. In a preliminary field experiment in which a portion of a mud flat was treated with carbaryl at rates similar to those used in the control of pests of oyster beds, carbaryl could be detected in the mud for 42 days. 1-Naphthol persisted in significant quantities for only one day. (Katz and Sjolseth-Washington)
W70-04164

ACUTE TOXICITY OF THE INSECTICIDE SEVIN AND ITS HYDROLYTIC PRODUCT 1-NAPHTHOL TO SOME MARINE ORGANISMS,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
Nelson E. Stewart, Raymond E. Millemann, and Wilbur P. Breese.
Transactions of the American Fisheries Society, Vol 96, No 1, p 25-30, Jan 1967. 2 tab, 20 ref. US Public Health Service Research Grant 5 RO1 EF 00628-02.

Descriptors: *Pesticide toxicity, *Crustaceans, *Mollusks, *Bioassays, Shrimp, Crabs, Perches, Stickelbacks, Mortality, Resistance, Water temperature, Larvae.
Identifiers: *Sevin, *1-naphthol, *Tolerance, Mytilus edulis, Crassostrea gigas, Clinocardium nuttallii, Parophrys vetulus.

The acute toxicity of Sevin (1-naphthyl N-methylcarbamate) and its hydrolytic product 1-naphthol to 10 species of marine animals was determined. Sevin was more toxic to larval and adult crustaceans (Upogebia pugettensis, Callianassa californiensis, Hamigrapsus oregonensis, Cancer magister) than to larval and adult mollusks. (Mytilus edulis, Crassostrea gigas, Clinocardium nuttallii) and juvenile fishes (Cymatogaster aggregata, Parophrys vetulus, Gasterosteus aculeatus). Sevin was 30 to 300 times more toxic than 1-naphthol to the crustaceans but less toxic than 1-naphthol to the mollusks and fishes. (Katz and Sjolseth-Washington)
W70-04165

REDUCED OXYGEN TOLERANCE AND TOXICITY OF PETROLEUM PRODUCTS TO JUVENILE AMERICAN SHAD,
Bureau of Commercial Fisheries, Beaufort, N.C. Biological Lab.
Marlin E. Tagatz.
Chesapeake Science, Vol 2, No 1-2, p 65-71, Mar-June 1961. 5 tab, 20 ref.

Descriptors: *Bioassay, *Oxygen requirements, *Dissolved oxygen, *Gasoline, Water pollution effects, Oily water, Toxicity, Oxygen demand, Oil, Mortality, Fishkill, Fisheries, Acclimatization.
Identifiers: *Petroleum products, *Alosa sapidissima, *Diesel fuel oil, *Tolerances, Bunker oil, American shad.

Experiments were conducted on juvenile American shad, Alosa sapidissima, to indicate tolerance to reduced oxygen, toxicity of petroleum products, and toxicity of petroleum products with accompanying low dissolved oxygen. All mortalities in reduced oxygen tests occurred at dissolved oxygen values of less than 2 ppm with lethal concentrations varying with the rate of reduction. No mortalities occurred when dissolved oxygen was maintained between 2 and 4 ppm. TL sub m values were determined for gasoline, diesel fuel oil, and bunker oil for 24- and 48-hour periods. Gasoline was the most toxic, fuel oil somewhat less toxic, and bunker oil least toxic. The lethality of petroleum products to shad was found to increase when accompanied by low dissolved oxygen. (Katz and Sjolseth-Washington)
W70-04166

ZOOPLANKTON STANDING CROPS IN A NEW AND AN OLD OZARK RESERVOIR,
Bureau of Sport Fisheries and Wildlife, Fayetteville, Ark.
Richard L. Applegate, and James W. Mullan.
Limnology and Oceanography, Vol 12, No 4, p 593-599, 1967. 4 fig, 5 tab, 18 ref.

Descriptors: *Zooplankton, *Standing crop, *Reservoirs, Seasonal, Density, Rotifers, Hydrography, Physicochemical properties, Biological properties, Sampling, Copepods, Daphnia, Fish, Sunfishes, Bass.
Identifiers: *Ozarks (Ark-Mo), Beaver Reservoir, Bull Shoals Reservoir, Cladoceran communities, Entomostracans, Bosmina longirostris, Ceriodaphnia lacustris, Ceriodaphnia quadrangula, Diaphanosoma leuchtenbergianum, Chaoborus, Cladocera, Leptodora kindtii, Moina affinis, Chydorus sphaericus, Leydigia acanthocercoides, Daphnia species, Leydigia quadrangularis, Pleuroxus denticulatus, Alona, Sida, Camptocercus.

Zooplankton populations (April 1964 through June 1966) of Beaver Reservoir before full impoundment are compared with those of 14-year-old Bull Shoals Reservoir, both on the White River in Arkansas-Missouri Ozarks. Seasonal standing crop estimates show a unimodal curve in the old reservoir and a bimodal curve in the new. Significant seasonal differences between the reservoirs occurred in densities, species composition of cladoceran communities, and horizontal distribution. A decrease in Bosmina longirostris densities in 1966 accounted for differences in magnitude of spring pulses between years in Bull Shoals Reservoir. A spring 1966 increase in the standing crop in Beaver Reservoir was associated with species changes within the genus Daphnia. Mean annual standing crops of entomostracans and rotifers were similar in both impoundments. Comparison of mean annual zooplankton standing crops does not indicate abnormally high production in the new reservoir during its filling stages. The standing crop in both reservoirs is rather low in comparison with other waters. Differences in seasonal zooplankton production may have enhanced fish production in the newer reservoir. LIBERATION OF ORGANIC ACIDS BY GREEN UNICELLULAR ALGAE,
Moscow State Univ. (USSR). Dept. of Microbiology.
I. V. Maksimova, and M. N. Pimenova.
Translated from Mikrobiologiya, Vol 37, No 1, p 77-86, Jan-Feb 1969. Microbiology, Vol 38, No 1, p 64-70, 1969. 7 fig, 4 tab, 17 ref.

Descriptors: *Algae, *Chlorella, *Organic acids, Biomass, Organic compounds, Carbohydrates.
Identifiers: *Green algae, Chlorella vulgaris, Chlorella pyrenoidosa, Volatile acids, Non-volatile acids, Ketoacids, Tamiya's mineral medium, Glyoxylic acid.

An investigation of the qualitative composition of organic acids liberated to the mineral medium by different strains of Chlorella vulgaris and Chlorella pyrenoidosa. Formic, acetic, lactic, pyruvic, a-ketoglutaric, acetoacetic in some cases comprised 25% of the extracellular compound. The filtrates of the algae always contained glyoxic acid. The total quantity of acids and their representation varied with the phase of growth and size of the biomass. Analysis of cells indicated that the acids were not derived from extracellular compounds. Secretion of nonvolatile acids, gradual accumulation of volatile acids, and the sharp increase in ketoacids at high density of the culture suggested that the processes are controlled by different machanisms. (Wilde-Wisconsin)

SPECIAL ASPECTS OF NITROGEN FIXATION BY BLUE-GREEN ALGAE,
Bristol Univ. (England). Dept. of Botany; and Westfield Coll., London (England). Dept. of Botany.
Rosalie M. Cox, and P. Fay.
Proceedings of the Royal Society (B), Vol 172, No 1029, p 357-366, 1969. 2 fig, 3 tab, 30 ref.

Descriptors: *Nitrogen fixation, *Algae, Light, Carbon dioxide, Inhibition, Nitrogen fixing bacteria, Radioactivity technique, Photosynthesis.
Identifiers: *Anabaena cylindrica, ATP, CMU, Nitrogen-15, Pyruvate, Acetylene reduction, Reductant.

More than 90% inhibition of carbon dioxide fixation by p-chlorophenyl-1, 1-dimethylurea (CMU) failed to influence nitrogen fixation by nitrogen-starved cells of Anabaena cylindrica, but retarded the process about 50% in normal cells of the organism. This suggested that nitrogen-fixation in Anabaena is independent of reducing potential generated by the photo-electron transport, but is stimulated by photosynthetically produced carbon skeletons. Increased light augmented nitrogen-fixation in the presence and in absence of CMU thus indicating the essential part of ATP in the process. The established 3:1 ratio of pyruvate decarboxylation to nitrogen-fixation is in agreement with the hypothesis that pyruvate donates hydrogen for nitrogen reduction, and that in blue-green algae the availability of the reductant is not influenced by photosynthesis. BIOLOGICAL AND ECOLOGICAL ASPECTS OF NITROGEN FIXATION BY FREE-LIVING MICRO-ORGANISMS,
Westfield Coll., London (England). Dept. of Botany.
W. D. P. Stewart.
Proceedings Royal Society (B), Vol 172, No 1029, p 367-388, 1969. 5 fig, 1 tab, 109 ref.

Descriptors: *Nitrogen fixation, *Microorganisms, Environmental effects, Ecological distribution, Aquatic habitats, Nitrogen fixing bacteria, Actinomycetes, Yeasts, Fungi, Growth rates.
Identifiers: *Free-living microorganisms, Nitrogen transfer, Growth factors, Acetylene reduction technique.

A summary of the effect of energy sources, oxygen combined nitrogen, iron, molybdenum, and hydrogen ion concentration on nitrogen fixation by free living bacteria and blue-green algae. The section on ecological significance of free-living nitrogen-fixing microbes enumerates bacteria and blue-green algae active in frigid regions, other uplands, and aquatic habitats. The effect of these organisms on the growth of higher plants is illustrated by examples from laboratory and field trials. During the last 20 years, many nitrogen-fixing bacteria and blue-green algae were added to the original list including genera Azotobacter, Clostridium, Nostoc, and Anabaena. Nevertheless, the overall importance of nitrogen-fixation by free-living organisms on a world-wide scale cannot be assessed because of insufficiency of reliable data. This includes the often over-rated role of Azotobacter and other heterotrophic bacteria. (Wilde-Wisconsin)

NUTRIENTS AND OTHER FORMS OF POLLUTION,
Minnesota Dept. of Conservation. Waters Section.
Gene H. Hollenstein.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 4-8, June 1969.

Descriptors: *Eutrophication, *Nutrients, Water pollution, Oligotrophy, Water properties, Water quality, Phosphorus, Farm wastes, Nitrogen.
Identifiers: Minnesota waters, Eutrophication control, Nutrient transport.

A brief summary of eutrophication is given. To reduce confusion between the definition of general pollution and nutrient pollution, eutrophication, the end pollution is defined as: the introduction of energy in any form into a resource which could adversely affect or destroy the resource for a particular use. Conversely eutrophication is a form of pollution defined as 'the process of enrichment of waters of lakes and streams with nutrients.' Eutrophication is a result of both natural changes and man's activities. Activities, such as sewage disposal and urbanization are enumerated and blamed for the present rapid increase in the level of eutrophication. There is no single cause or solution to eutrophication. The methods suggested to evaluate the significance and effects of possible nutrients (phosphorus, nitrogen, carbon, trace metals, potassium, silica, and vitamins) are to obtain surface and groundwater flow patterns and quality analysis, primarily on phosphorus and nitrogen entering, leaving, and retained in water bodies being studied. The major problem of eutrophication is finding methods for controlling the rate and amount of eutrophic activity without halting this process. Possible methods of nutrient control and the values

of water are listed. (See W70-04266). (Bannerman-Wisconsin)

DIAGNOSING POLLUTION IN LAKE MINNETONKA,
Minnesota Univ., Minneapolis. Limnological Research Center.
Robert O. Megard.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 9-14, June 1969. 1 fig, 1 tab, 2 ref.

Descriptors: *Phosphorus, *Nitrogen, *Algae, Sewage plants, Chlorophyll, Photosynthesis, Tributaries, Watershed management, Sediments.
Identifiers: Lake Minnetonka (Minn), Nutrient traps, Nutrient influx, Nutrient sources, Phosphorus budget, Aphanizominon flos aquae.

Increased monetary spending on waste disposal and watershed management is suggested as a recourse to deteriorating quality of lakes. An example, is widening the scope of sewage treatment to include objectives of maintaining recreational and aesthetic values of lakes as well as minimizing health hazards. Measuring abundance and daily growth of algae by chlorophyll analysis and photosynthesis experiments respectively, is a method of comparing lakes and assessing effectiveness of nutrient abatement programs. Data was gathered from Lower Lake of Lake Minnetonka adjacent to Minneapolis, Minnesota, and a direct correlation between phosphorus concentration was discovered during July and August. Each pound of phosphorus was considered responsible for 500 lbs of dry algae during the two months. Data on influx of phosphorus from tributaries and concentration in the lake indicated that sediments were the major nutrition trap. There was doubt whether phosphorus released by sediments between May and August was available to algae. Data indicated that reducing phosphorus influx by one-half would substantially control Lower Lake's eutrophication based on the assumption that a large portion of phosphorus is removed by biogeochemical process. (See W70-04266). (Bannerman-Wisconsin)
W70-04268

EFFECT OF EUTROPHICATION ON FISH AND RELATED ORGANISMS,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
Lloyd L. Smith.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 15-18, June 1969.

Descriptors: *Eutrophication, *Fish harvest, *Fish, *Fish management, *Fish populations, Detritus, Decomposing organic matter, Water pollution effects, Aquatic bacteria, Oxygen, Lakes, Minnesota.
Identifiers: Desirable fish species, Algal growth, Stream oxygen levels, Oxygen depletion, Paper mill pollutants, Sphaerotilus, Walleye pike eggs.

Eutrophication is considered in the framework of fish management, excluding aesthetic considerations and views only effects on total fish populations. Before adverse levels of eutrophication eliminate certain areas from active fish production, nutrient additions increase fish biomass per acre. Often increased production will be accompanied by adverse aesthetic effects. The principal disadvantage of eutrophication to fish is lowering the oxygen supply to 5 parts per million or lower. Below 5 ppm the harvestable crop is reduced and existence of desirable deep cold water species is threatened with a shift to less desirable warm water species. Increasing amounts of hydrogen sulfide produced by decomposing beds of detritus could be lethal to fish and fish eggs. Eutrophication would increase production, while at the same time accelerate natural mortality and shift in species by high hydrogen sulfide concentrations. Long term effects of eutrophication would be increased protein production because of higher annual production of less desirable warm water fish species. (See W70-04266). (Bannerman-Wisconsin)
W70-04269

ANIMAL WASTE DISPOSAL PROBLEMS AND TRENDS IN MINNESOTA,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
Evan R. Allred.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 22-28, June 1969. 2 fig, 3 tab.

Descriptors: *Livestock, *Wastes, *Farm wastes, Organic wastes, Minnesota, Biochemical oxygen demand, Farms, Pollutants, Water pollution sources, Eutrophication.
Identifiers: *Livestock waste disposal, Broiler farms, Livestock wastes comparison, Feedlots, Manure production, Food production wastes, Projected livestock farms, Wastes management.

The growing problem of animal waste disposal resulting from the trend toward concentration of livestock on fewer farms is discussed. Data compiled in Minnesota indicates large percentage of these farm animals are on feed and in confinement. The problem will accelerate as herds grow larger to meet future population demands. By 1980 there is a projected 10-fold increase in the average hog and feed-cattle herd size in Minnesota. Three reasons given for failure to solve animal waste disposal problems are: (1) reluctance to monetary expenditures on adequate methods, (2) because the problem has been considered unrelated to other parts of society, and (3) approaches have been used that are only applicable to other types of waste. Cost involved and the enormity of the problem are realized when data presented indicate a 250,000 bird poultry enterprise has a biochemical oxygen demand waste equivalent to a city population of 25,000. Eutrophication is increased by spreading manure on frozen ground and the consequent runoff in spring thaw. Since the cost of a treatment plant and storage is prohibitive to individual farmers, it is concluded that no immediate, simple solution is in sight. (See W70-04266). (Bannerman-Wisconsin)
W70-04270

MANAGING LIVESTOCK WASTES TO CONTROL POLLUTION,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
James A. Moore.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 29-34, June 1969. 2 tab.

Descriptors: *Pollution control, *Organic loading, *Cattle, *Hogs, *Sheep, *Farm wastes, Water pollution sources, Water quality, Waste disposal, Minnesota, Nitrogen, Phosphorus, Potassium, Aerobic treatment, Water pollution control.
Identifiers: *Manure processing, *Manure disposal, Livestock industry, Manure storage, Oxidation ditch.

High costs and larger quantities of inert and biologically stable materials prohibit many municipal waste treatment systems being used for animal waste disposal. No system has been designed to remove nitrogen and phosphorus in animal wastes. Four steps in the management of manure are suggested: (1) collection, (2) processing, (3) storage, (4) utilization or disposal. Drying manure simplifies sanitation problems because it is stable, relatively odorless, and breeds few flies. Energy required for drying limits method. Anaerobic lagoons are a popular method for stabilizing organic matter, because disposal problems are mostly eliminated. Animal waste can be treated in aerobic oxidation ponds with oxygen supplied by algae and natural reaeration supplemented by mechanical aeration. Impervious-bottom tanks and storage areas should be considered to prevent nutrient leaching during extended holding periods. Although economically non-competitive, more effort to dispose animal waste as fertilizer would alleviate the problem and prove beneficial to soils. (See W70-04266). (Bannerman-Wisconsin)
W70-04271

RUNOFF AND SEDIMENT AS NUTRIENT SOURCES,
Agricultural Research Service, Morris, Minn. North Central Soil Conservation Research Center.
Robert F. Holt.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 35-38, June 1969. 3 tab, 3 ref.

Descriptors: *Surface runoff, *Sediments, *Nutrient sources, Phosphorus, Nitrogen, Minnesota, Lakes, Nutrients, Snowmelt, Sediment load, Agronomic crops, Forages.
Identifiers: Barnes soil, Corn crops, Oats crops, Hay crops, Fallow land, Cropping treatments, Alfalfa plants.

Amounts of nitrogen and phosphorus added to surface waters by runoff depend upon soil texture, vegetation, organic residue, and management practices. Runoff contribution to sediment fertility is based on soil, topography, and vegetation. Data provided indicate large quantities of phosphorus are removed from surface water by sediments. Although sediment contribution to soluble nutrient leach is not known, sediments are not believed to release significant amounts of soluble phosphorus. Data supplied qualifies agricultural runoff as a major contributor of nutrients to surface waters. Crop type and farming techniques influence quantities of phosphorus and nitrogen contributed by runoff. Alfalfa plots contribute the greatest quantities of soluble phosphorus during snowmelt runoff. In most cases eutrophication is regarded as an irreversable process because it is a natural phenomena. (See W70-04266). (Bannerman-Wisconsin)
W70-04272

CONTROLLING NUTRIENTS AND ORGANIC TOXICANTS IN RUNOFF,
Minnesota Univ., Minneapolis. Dept. of Soil Science.
William P. Martin.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 39-47, June 1969. 15 ref.

Descriptors: *Waste water disposal, *Sediments, *Nutrients, *Surface runoff, Groundwater, Erosion, Agricultural watersheds, Minnesota, Lagoons, Waste dilution, Waste disposal, Waste water disposal, Soil properties, Nitrogen, Phosphorus.
Identifiers: Recharge basins, Organic toxicants, Agricultural pollution, Minnesota Soil Survey, Waste spray irrigation, Land waste disposal, Agricultural wastes pollutants, Waste disposal systems.

Increased numbers of soil surveys are essential to each land use decision, specifically in land waste disposal. Leaching, erosion, and groundwater contamination are minimized when suitable soils are chosen for specific uses, such as feedlots. Waste disposal has been practiced without regard for location, which can result in severe contamination in sandy soils that safely accommodate only 100 lbs of nitrogen/acre per growing season. When organic food sources are available, the microbial population of soil is able to decompose almost any amount of organic material introduced. Large quantities of organic materials could be disposed without harming the environment. Nitrate contamination in aerated soils is a serious problem and results from nitrifying bacteria oxidizing ammonia released

from ammonification. Denitrifying bacterial will reduce nitrate concentration under anaerobic conditions. Growing plants will also reduce nitrate concentration. Nitrogen influx into groundwater is reduced by holding lagoons or rotation spreading. Phosphorus is easily fixed in the soil and is not considered a problem. Several successful land waste disposal systems, such as using recharge basins, are discussed. (See W70-04266). (Bannerman-Wisconsin)
W70-04273

TREATMENT OF MUNICIPAL WASTES,
Minnesota Univ., Minneapolis. Dept. of Civil Engineering.
Walter K. Johnson.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 48-52, June 1969. 2 fig, 1 tab.

Descriptors: *Waste treatment, *Domestic wastes, *Municipal wastes, Wastes, Phosphorus, Nitrogen, Industrial wastes, Infiltration, Denitrification, Chemical precipitation, Biological treatment, Ion exchange, Filtration, Adsorption, Reverse osmosis.
Identifiers: Diurnal concentrations, Commercial wastes, Ammonia stripping.

Limited assimilative capacity of receiving waters restricts the municipal effluent flow allowable before pollution becomes a problem. With increasing population, larger volumes of flow are inevitable, demanding upgrading of wastewater treatment as a pollution preventative. Technology to improve treatment is emphasized as being available, but what is needed now are human and financial resources. Four sources of municipal wastes are discussed: domestic, commercial, industrial, and infiltration. Removing solids from dilute waste water is a major processing problem. Average flow is 120 gallons per day per person. After primary and secondary treatment, which are physical and biological process respectively, comes the removal of nutrients by tertiary treatment. With technology available for all three treatments, municipalities could have a closed water system. For general removal of solids in tertiary treatment the processes of filtration, adsorption, and reverse osmosis are suggested. (See W70-04266). (Bannerman-Wisconsin)
W70-04274

SEPTIC TANK EFFLUENTS,
Minnesota Univ., Minneapolis. Dept. of Civil Engineering.
Robert C. Polta.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 53-57, June 1969. 1 fig.

Descriptors: *Septic tanks, *Effluents, Groundwater, Nitrification, Nitrogen, Phosphorus, Absorption, Soil types, Ammonia, Wells, Water pollution sources.
Identifiers: Groundwater contaminants, Phosphorus fixation.

Septic tanks are a potential source of nitrogen and phosphorus contamination due to effluent discharge by means of tile fields and seepage pits. Groundwater can then pollute surface water by direct flow or indirectly, by pumping and subsequent surface discharge. Many soils reduce possible phosphorus contamination by their tremendous phosphorus fixing ability. Fixation processes include adsorption, mineral crystal structure may be changed by replacement reaction, and formation of insoluble phosphorus compounds and subsequent precipitation. Fixation can remove as much as 8000 lbs phosphorus/acre to a depth of 6 inches. Extent of nitrogen flow in groundwater is affected by adsorption-ion exchange phenomena exhibited by soils, and action of nitrifying and denitrifying bacteria. Since most nitrogen is ammonia, as much as 10 milligrams nitrogen/100 grams can be adsorbed by basic, negatively charged soils. Nitrogen mobility is increased by nitrifying bacteria converting nitrogen compounds to nitrates, which is not adsorbed. At the present there is no practicable method to limit nitrification. Although phosphorus is not a serious threat, nitrogen groundwater contamination has been found considerable distances from the source. Eutrophication and methemoglobinemia could result from groundwater nitrogen. (See W70-04266) (Bannerman-Wisconsin)
W70-04275

WATER POLLUTION IN RECREATIONAL AREAS--SOURCES AND CONTROL,
Forest Service (USDA), Ely, Minn. Superior National Forest.
Michael A. Barton.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 58-63, June 1969. 1 tab, 7 ref.

Descriptors: *Water pollution sources, *Water pollution control, *Waste disposal, Minnesota, Clearcutting, Recreation wastes.
Identifiers: Silvicultural practices, Herbiciding, Honeywagons.

Although water pollution is not severe in recreational areas, demand for high water quality necessitates pollution control. Prevention programs are emphasized as more promising and less costly than correction programs. Primary water pollution problem in recreational areas is nutrient enrichment, which is surprisingly high, because visitors concentrate in small areas compared to total park area. Another significant nutrient source is water inflow from municipalities. Disposal is a special problem in wilderness areas. Nutrient export by airplane and helicopter 'honeywagons', or combustion toilets have been suggested. Oil from outboard motors exerts an oxygen demand. Silviculture practices of clearcutting and herbiciding can increase stream nitrogen concentration 20 times. Natural input of nutrient from soils and vegetation in the watershed are verified as significant sources by given data. Establishing monitoring system of physical, chemical, and biological parameters is suggested to measure effectiveness of control measures. (See W70-04266). (Bannerman-Wisconsin)

THE USE OF A DEEP TANK IN PLANKTON ECOLOGY. I. STUDIES OF THE GROWTH AND COMPOSITION OF PHYTOPLANKTON CROPS AT LOW NUTRIENT LEVELS,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
J. D. H. Strickland, O. Holm-Hansen, R. W. Eppley, and R. J. Linn.
Limnology and Oceanography, Vol 14, No 1, p 23-34, 1969. 9 fig, 4 tab, 17 ref.

Descriptors: *Plankton, *Laboratory tests, *Ammonia, *Nitrate, Silica, Proteins, Carbohydrates, Phosphorus, Lipids, Chlorophyll, Phytoplankton, Nutrient requirements.
Identifiers: Phytoplankton growth, Phytoplankton composition, Nutrient levels, Ditylum brightwellii, Cachonina nici, Gonyaulax polyedra, Phaeocystis, DNA, ATP, Chlorophyll a, Chlorophyll c.

A cylindrical tank, 3 meters in diameter and 10 meters tall, was used to grow phytoplankton crops under simulated natural conditions of nutrient concentration and cell density. Construction and operation of the tank are described. Three, two-week, growth experiments were performed using Ditylum brightwellii (a centric diatom), Cachonina nici (an armored dinoflagellate), with a mixed crop of the dinoflagellate Gonyaulax polyedra and Phaeocystis (a colonial member of Haptophyceae). In each experiment the chemical composition of the tank-grown cultures were analysed for cell carbon, nitrogen, phosphorus, lipid, carbohydrate, DNA, ATP, chlorophyll a, and carotenoids. Successful nitrogen budgets were achieved with D brightwellii and C nici. Nearly all the ammonia was used before any nitrate was assimilated. With D brightwellii, there was a marked increase in chlorophyll, phosphorus, and ATP contents when the cells switched from ammonia to nitrate. Lipid content increased nearly twofold in nitrate-grown cells. Unlike the behavior found with D brightwellii, the cells of C nici grown on nitrate had approximately equal values of lipid, chlorophyll, phosphorus, and ATP as cells grown on ammonia. Carbohydrate contents, however, increased sixfold in nitrogen-starved cells. Upon addition of nitrate the concentration of carbohydrates decreased appreciably. (Haskins-Wisconsin)

THE KINETICS OF NITRATE AND AMMONIA UPTAKE BY NATURAL POPULATIONS OF MARINE PHYTOPLANKTON,
Washington Univ., Seattle. Dept. of Oceanography.
J. J. MacIssaac, and R. C. Dugdale.
Deep-Sea Research, Vol 16, p 45-57, 1969. 8 fig, 3 tab, 17 ref.

Descriptors: *Kinetics, *Nitrates, *Ammonia, *Population, *Marine plants, *Phytoplankton, Tracers, Alaska, Pacific Ocean, Enzymes, Nutrients, Productivity, Oligotrophy, Eutrophication, California, Gulfs, Spectrometers, Sampling, Nitrites, Radioisotopes, Detritus, Light intensity, Depth, Mexico, Velocity, Incubation, Silicates, Phosphates, Vitamin B, Trace elements, Iron, Growth rates, Tropical regions.
Identifiers: *Uptake, Nitrogen-15, Bering Sea (Alaska), Michaelis-Menten equation, Stephen's Passage (Alaska), Particulate, Costa Rica, Nutrient concentration, Cyclotella nana, Phaedactylum tricornutum, Euphotic zone.

Natural marine phytoplankton populations response to nitrate and ammonia concentrations has been investigated using nitrogen-15 tracer techniques. Bering Sea, waters off southeastern Alaska, and northeastern tropical Pacific experiments suggest that uptake of both compounds follows the Michaelis-Menten expression for enzyme kinetics. A hyperbola describes the relationship between the concentration of nitrate or ammonia and uptake of that nutrient. Such a hyperbola can be obtained in experiments with ammonia and, under suitable conditions, with nitrate. The value of K-sub-t, nutrient concentration at which the maximum uptake rate is reduced by 1/2, is related to the nutrient and productivity regime of the region inhabited by the population. In the tropical oligotrophic area investigated, K-sub-t nitrate is less than 0.2 micrograms atoms/liter, while in corresponding eutrophic regions, K-sub-t nitrate exceeds 1.0 micrograms atoms/liter. These values suggest that phytoplankton populations of oligotrophic regions are adapted to low ambient nutrient concentrations and are able to take up nutrients at a higher rate under these conditions than would phytoplankton species characteristic of eutrophic conditions and showing a higher K-sub-t value. TOXICITY AND ENVIRONMENTAL REQUIREMENTS OF A STRAIN OF APHANIZOMENON FLOS-AQUAE (L) RALFS,
National Marine Water Quality Lab., West Kingston, R.I.
John H. Gentile, and Thomas E. Maloney.
Canadian Journal of Microbiology, Vol 15, No 2, p 165-173, 1969. 7 fig, 2 tab, 25 ref.

Descriptors: *Toxicity, *Nutrient requirements, *Cyanophyta, *Environment, Nitrogen fixation, Hydrogen ion concentration, Growth rates, Temperature, Phosphorus, Age, Light intensity, Assay, Fish, Crustaceans, Daphnia, Copepods, Killifishes, Dissolved oxygen, Bacteria, Cytological studies, Biochemistry, Spores, Carbon radioisotopes, Bicarbonates, Incubation, Shiners, Copper sulfate.
Identifiers: *Aphanizomenon flos-aquae (L) Ralfs, Tris, Fundulus heteroclitus, Cyprinodon variegatus, White mice, Notemigonus crysoleucas, Bosmina longirostris, Daphnia catawba, Ostracods, Chydorid cladocerans, Microcrustaceans, Microcystis aeruginosa, Anabaena flos-aquae, Gloeotrichia ecinulata, Nitzschia, Endotoxin, Contaminants, Algal bloom.

A toxic strain of Aphanizomenon flos-aquae was isolated and cultured in a defined medium (ASM-1). This strain fixes nitrogen, has pH optimum of 7.5 and maximum growth rates at 5000 lux and 26C. Phosphorus levels of 1.0 micromoles readily supported populations of 100,000 cells/milliliter with growth stimulation evident at concentration of 0.1 micromoles phosphorus. Tris is inhibitory to growth at concentrations above 2.5 micromoles. Toxin production is related to culture age, temperature, and light intensity but not nitrogen source. Intraperitoneal injection of toxic extracts into Fundulus heteroclitus, Cyprinodon variegatus, and white mice gave a LD (100%) of 0.5 milligrams/kilogram, 0.5 milligrams/kilogram, and 8 milligrams/kilogram, respectively. Assays with Notemigonus crysoleucas and Bosmina longirostris indicate that toxin from naturally occurring bloom populations (1,000,000 cells/milliliter) if total released simultaneously, could kill certain fish species and microcrustaceans. Daphnia catawba was more toxin resistant (LD (100%) equals 1.0 milligrams/milliliter) while cyclopod copepods, ostracods, and chydorid cladocerans were unaffected by toxin concentrations of 2.0 milligrams/milliliter. Ecological significance of this toxic alga in relation to fish kills is discussed. (Jones-Wisconsin)

STUDIES OF A SIMPLE LABORATORY MICROECOSYSTEM: BACTERIAL ACTIVITIES IN A HETEROTROPHIC SUCCESSION,
Georgia Univ., Athens, Dept. of Microbiology; and Georgia Univ., Athens. Dept. of Zoology.
Robert W. Gordon, R. J. Beyers, E. P. Odum, and R. G. Eagon.
Ecology, Vol 50, No 1, p 86-100, 1969. 8 fig, 12 tab, 54 ref.

Descriptors: *Laboratories, *Ecosystems, *Bacteria, Aquatic microorganisms, Chlorella, Vitamin B, Carbon dioxide, Nitrogen, Primary productivity, Decomposing organic matter, Photosynthesis, Respiration, Biomass, Biological communities, Metabolism, Carbon radioisotopes, Sewage, Texas, Biochemistry, Electron microscopy, Pseudomonas, Enzymes, Fungi, Organic matter, Lactobacillus, Spectrophotometry, Chromatography, Scenedesmus, Depth, Stratification.
Identifiers: *Heterotrophic succession, Excretions, Dissolved carbon, Particulate, Microcosm, Austin (Tex), Flagellates, Heterotrophic, Ostracods, Xanthomonas, Bacillus, Chromogenic characteristics, Species diversity, Glyoxylate, Radioautography, Optical density, Growth factors, Schizothrix calciocola, Paramecium bursaria, Lepadella.

Eleven species or functional types of heterotrophic bacteria were isolated during study of heterotrophic succession in an aquatic microcosm. Bacterial population numbers and dominant types changed rapidly. Dominant primary producer, Chlorella, depended upon thiamin supplied by five bacterial isolates. Bacteria were functional contributors of thiamin, carbon dioxide, and possibly nitrogen sources to primary producers; as primary consumers of algal excretions; as secondary consumers of bacterial excretions; as decomposers. During succession net photosynthesis surpassed night respiration from day 5 through 45; as maturity approached the photosynthesis respiration ratio fluctuated around 1. Dissolved carbon was present at 240 milligrams/liter at zero time and decreased owing to heterotrophic activity of 0.0000000015 bacterial cells/milliliter by day 8 and maintained at approximately 20.7 milligrams carbon/liter from day 8 through maturity. Particulate biomass increased steadily until day 50; no further increase followed. Bimodal pattern showed in bacterial numbers, Chlorella numbers, community metabolism, carbon-14-U glyoxylate uptake and bacterial species diversity. Peaks appeared early and late in succession with mid-succession decrease in activity. The microcosm exhibited trends expected of larger, more open, developing ecosystems. Methods are useful tools for examining ecological principles. (Jones-Wisconsin)

THE RIGHT TO A CLEAN ENVIRONMENT,
Mount Sinai School of Medicine, New York. Dept. of Community Medicine.
Eric J. Cassell.
Archives of Environmental Health, Vol 18, p 839-843, 1969.

Descriptors: *Air pollution, *Air pollution effects, *Mortality, Population, Public health, Sulfides, Environmental effects.
Identifiers: *Sulfur dioxide, Catalytic metals, Donora (Pa), London, Synergism, New Florence (Pa), Seward (Pa).

Research in air pollution was stimulated by the death of 22 persons in Donora, a Pennsylvania town of 14,000, and the illness of about half that population. The toxic substances, ranging from sulfur dioxide to hydrocarbons, caused eye irritation, chronic bronchitis, and increased mortality. The 1952 London air pollution episode produced some 4,000 deaths above normal in two weeks. The ill effects of sulfur dioxide appear to materialize only when air contains some particulate matter or catalyzing particles that convert sulfur dioxide to sulfuric acid. Gasoline, plastic bags, transistors, food packaging, building materials, drugs, and endless other substances carry copper, nickel, vanadium, titanium, boron, barium, and numerous other catalytic metals which end their life in the air via incinerators. (Wilde-Wisconsin)

THE NATIONAL ESTUARINE POLLUTION STUDY - VOLUME I.
Federal Water Pollution Control Administration, Washington, D.C.
Federal Water Pollution Control Administration Report to Congress, Nov 3, 1969. 130 p, 3 fig.

Descriptors: *Estuaries, *Water resources development, *Water management (Applied), *Environmental effects, *Water pollution control, Surveys, Environmental sanitation, Water pollution effects, Regulation, Waste disposal, Sewage treatment, Water pollution sources, Recreation, Fishing, Transportation, Economics, Social aspects.
Identifiers: Estuarine resources management.

Existing pertinent information on estuarine environments is assembled, coordinated, and organized, and additional investiations and surveys were carried out to supplement existing information. Not only are recommendations made for a national program, but also an analysis of the importance of estuaries in the economic and social environment and the effects of pollution on the natural ecosystem is given. Major economic, social, and ecological trends were examined to show what the future might hold; and recommendations are made for research and study to acquire basic knowledge needed to manage future trends. The recommended national program is based on institutional management with multiple long-term use as a common denominator. Formation of the organizations to accomplish this and the active implementation of these recommendations will permit maximum use of the entire estuarine zone while preserving it for the benefit of future generations. (Knapp-USGS)

THE NATIONAL ESTUARINE POLLUTION STUDY - VOLUME II.
Federal Water Pollution Control Administration, Washington, D.C.

Federal Water Pollution Control Administration Report to the Congress, Nov 3, 1969. 575 p, 38 ref.

Descriptors: *Estuaries, *Water resources development, *Water management (Applied), *Environmental effects, *Water pollution control, Surveys, Environmental sanitation, Water pollution effects, Regulation, Waste disposal, Sewage treatment, Water pollution sources, Recreation, Fishing, Transportation, Economics, Social aspects.
Identifiers: Estuarine pollution.

The existing relationship between the biophysical environment and the socioeconomic environment in the estuarine zone of the U.S. is described. The estuarine zones before man's use as well as the uses of the estuarine zone and their effects on the land, the water, and the life are discussed. What will happen to the estuarine zone unless man controls his impact on this part of his environment is shown. The biophysical environment divides naturally into ten geographical regions, each dominated by a different combination of environmental conditions. The discussion revolves about these biophysical regions as the primary subdivisions of the natural environment of the estuarine zone. Because of the similarity of environmental conditions within it, each region has estuarine systems, uses, and problems which are typical of the region, if not unique to it. The essential unity of the estuarine zone as a unique resource is emphasized because an effective national management program needs to use knowledge gained in one region to solve problems in the others. (Knapp-USGS)

THE NATIONAL ESTUARINE POLLUTION STUDY - VOLUME III.
Federal Water Pollution Control Administration, Washington, D.C.

Federal Water Pollution Control Administration Report to the Congress, Nov 3, 1969. 640 p, 8 fig, 33 tab, 31 ref.

Descriptors: *Estuaries, *Water resources development, *Water management (Applied), *Environmental effects, *Water pollution control, Surveys,

Environmental sanitation, Water pollution effects, Regulation, Waste disposal, Sewage treatment, Water pollution sources, Recreation, Fishing, Transportation, Economics, Social aspects.
Identifiers: Estuarine resources management.

Background material is compiled for the National Estuarine Pollution Study. To provide a basis for developing recommendations and defining responsibilities, a volume of material was amassed on the views, suggestions, programs, and legislative authorities of all sectors of the National community -- Federal, State, and local governments, and public and private interests. The resulting material consists of reports, correspondence, and personal communications which were analyzed and summarized to produce relatively brief overviews. The organizations include Federal agencies, State agencies, local governments, compact (or interstate) agencies, and public and private interests. These overviews were related to those of other marine resource studies and then related to specific geographic areas to present a concrete overall view, and finally summarized in the form of Conclusions. A skeletal outline is provided for the development of recommendations. Guidelines are suggested for a management statute. (Knapp-USGS)

EFFECT OF INDUSTRIAL EFFLUENT ON WATER QUALITY OF LITTLE SIX MILE CREEK NEAR JACKSONVILLE, FLORIDA,
Geological Survey, Ocala, Fla.
Donald A. Goolsby.
Available from Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $3.75 per copy. Geological Survey Research 1969, Professional Paper 650-D, p D240-D243, 1969. 4 p, 4 fig, 1 tab, 1 ref.

Descriptors: *Water pollution effects, *Acidic water, *industrial wastes, *Florida, Water quality, Data collections, Sampling, Monitoring, Acidity, Dissolved oxygen, Solutes.
Identifiers: Jacksonville (Fla).

A reconnaissance of Little Six Mile Creek near Jacksonville, Fla., made August 24-26, 1965, showed that acid industrial effluent has severely affected the entire stream, and during low flow, the upper Ribault River. The total acid load of the effluent during this reconnaissance was equivalent to 1.7 tons per day as sulfuric acid and the dissolved-iron load was equivalent to 0.4 ton per day. At times the acid effluent is neutralized by alkaline effluent from a tributary stream. (Knapp-USGS)
W70-04344

THE RATE OF LIBERATION OF PHOSPHATE IN SEA WATER BY THE BREAKDOWN OF PLANKTON ORGANISMS,
Marine Biological Association of the United Kingdom, Plymouth (England). Lab.
L. H. N. Cooper.
Journal of the Marine Biological Association of the United Kingdom, Vol 20, p 197-200, 1941. 1 fig, 1 tab, 6 ref.

Descriptors: *Phosphates, *Sea water, *Plankton, Zooplankton, Phytoplankton, Time, Diatoms, Sampling.
Identifiers: *Phosphate liberation, *Inorganic phosphate, Phosphate-phosphorus breakdown, Calanus, Acartia, Temora, Ctenophores, Rhizosolenia, Skeletonema costatum, Guinardia flaccida.

Four experiments were made to determine the rate inorganic phosphate is set free from plankton. Samples of animal and plant plankton caught in fine and very fine silk tow-nets were analyzed for phosphorus, and aliquot parts filtered on a silk disc. They were added to sea water in glass vessels and subsequent changes in the phosphate content of water followed. Breakdown of zooplankton was very rapid and more phosphate was released than the original addition as plankton. The balance was produced from dissolved organic phosphorus compounds in the water. Breakdown of phytoplankton showed a short time lag and only a portion of phosphorus added was freed as phosphate. An inflection in the curves was noted after 15-20 days' storage. Rate of liberation slowed and accelerated again before reaching the maximum. A slow fall in phosphate occurred during the four months after the maximum had been reached; no explanation is apparent for this, although molds may be involved. Experimental waters were much richer in plankton than sea water ever is, thus presumably, all processes of decay were greatly accelerated, compared with natural conditions. (Jones-Wisconsin)
W70-04366

ECOLOGY AND CHARACTERIZATION OF YEASTS FROM AQUATIC REGIONS OF SOUTH FLORIDA,
Miami Univ., Fla. Dept. of Microbiology; and Miami Univ., Fla. Inst. of Marine Sciences.
D. G. Ahearn, F. J. Roth, Jr., and S. P. Meyers.
Marine Biology, Vol 1, No 4, p 291-308, June 1968. 9 fig, 7 tab, 36 ref.

Descriptors: *Ecology, *Yeasts, *Florida, *Aquatic environments, Fresh water, Salinity, Bioindicators, Fungi, Habitats, Sampling, Estuaries, Systematics, Sea water, Hydrogen ion concentration, Molds.
Identifiers: *South Florida waters, Miami (Fla), Everglades (Fla), Lake Okeechobee (Fla), Candida, Physiological charactertistics, Saccharomyces fructuum, Debaryomyces hansenii, Cryptococcus laurentii, Cryptococcus albidus, Rhodotorula, Torulopsis glabrata, Torulopsis ernobii, Hansenula anomala, Pichia, Trichosporon cutaneum, Kluyveromyces aestuarii, Sporobolomyces, Spirodela, Ascosporogenous, Asporogenous, Morphological.

The composite aquatic regions of southern Florida and adjacent areas were the site of mycological investigations based on more than 1000 yeasts collected and exceeding 50 representative taxa. Highest yeast densities were found in fresh waters with the recovery of yeasts per sample decreasing from 100% to approximately 70% with lowered organic content, increasing salinity and remoteness from land. Average cell population densities, species, variety, and particularly the number of sexual yeasts, decreased in saline samples. The isolation media used were evaluated and discussed in terms of yeast densities obtained. Strictly oxidative species of Candida, Cryptococcus, and Rhodotorula and the sexual yeast, Debaryomyces hansenii, were widespread in all the habitats studied and predominated in water of relatively low organic content. Selective survival of certain yeasts in various aquatic environments is suggested. Definite distributional patterns were exhibited by various taxa and the possible existence of 'indicator' species is indicated. Systematics of fungi are reviewed at length and the significance of strain differences considered and discussed, as related to the unique characteristics of the various ecological habitats. (Jones-Wisconsin)
W70-04367

YEASTS FROM THE NORTH SEA,
Miami Univ., Fla. Inst. of Marine Sciences; Miami Univ., Fla. Dept. of Microbiology; and Biologische Anstalt Helgoland (West Germany).
S. P. Meyers, D. G. Ahearn, W. Gunkel, and F. J. Roth, Jr.
Marine Biology, Vol 1, No 2, p 118-123, 1967. 6 fig, 1 tab, 19 ref.

Descriptors: *Yeasts, Population, Marine plants, Dinoflagellates, Oceans, Bioindicators, Fungi, Estuaries, Bacteria, Sampling, Seasonal, Hydrography, Florida, Thermocline, Currents (Water), Phytoplankton, Zooplankton, Hydrogen ion concentration, Algae.
Identifiers: *North Sea, Mycota, Debaryomyces hansenii, Rhodotorula rubra, Candida diddensii, Candida zeylanoides, Candida krusei, Candida obtusa, Candida tropicalis, Noctiluca miliaris, Helgoland (Germany), Aureobasidium pullulans, Hanseniaspora uvarum, Radulespores, Zymological, Elbe (Germany), Sporobolomyces roseus, Autolysis, Ascosporogenous.

Mycological examination of estuarine and open ocean environments have revealed diverse populations of yeast of various taxa and physiological groups. Evidence indicates that these microorganisms are normal components of ocean biota, and that certain species may serve as bio-indicators for specific water masses and conditions. Data are needed on the mycota associated with algal 'blooms' and their effect on growth stimulation and reproduction of fungi. Yeasts were isolated from twelve established sites in the North Sea from 1964 to 1966. A percentage frequency of 99% with populations varying from less than 10 to more than 3000 viable cells/liter was observed. This mycota was characterized by considerable spatial and temporal fluctuations, with the dominant yeast present the ascosporogenous species, Debaryomyces hansenii. This taxon, as well as other common North Sea yeasts, Rhodotorula rubra and Candida diddensii, have been reported frequently from other marine locales. Noteworthy concentrations of yeasts, especially D hansenii, were observed during summer, often in association with various stages of development of the dinoflagellate, Noctiluca miliaris. Population dynamics of the North Sea yeasts are discussed in relation to similar studies of other marine environments. (Jones-Wisconsin)

THE PHYSIOLOGY OF AN ALGAL NUISANCE,
Westfield Coll., London (England). Dept. of Botany.
G. E. Fogg.
Proceedings Royal Society B, Vol 173, p 175-189, 1969. 4 fig, 84 ref.

Descriptors: *Nuisance algae, Cyanophyta, Vitamins, Peptides, Organic matter, Trace elements, Light intensity, Chlamydomonas, Chlorella, Enzymes, Carbon dioxide, Growth rates, Plankton, Oxygen, Nitrogen fixation, Nitrates, Electron microscopy, Ammonia, Spectrometers, Diffusion, Turbulence, Toxins, Bacteria, Copper sulfate, Circulation.
Identifiers: *Physiology, Spirogyra, Myxophyceae, Microcystis, Coelosphaerium, Oscillatoria, Anabaena, Aphanizomenon, Gloeotrichia, Polypeptides, Photoassimilation, Berkelse Lake (Netherlands), Heterocysts, Gas-vacuoles, Llangors Lake (Wales), Halobacterium, Respirometer, Protoplasm, Water-blooms, Lake George (Uganda), Rhine-Meeuse delta (Netherlands), Hohlspindeln, Myxophycean blooms.

Physiology of Microcystis, Coelosphaerium, Oscillatoria, Anabaena, Aphanizomenon, and Gloeotrichia are discussed relative to development of blooms. Since the algae form gelatinous masses, local exhaustion of ammonia may force cells to utilize the nitrogen molecule, aggravating eutrophication. Remarkable features of the planktonic blue-green algae are cells containing gas-vacuoles. These gas-filled cavities in protoplasm appear as indefinite, irregular, refractive bodies. The relatively high buoyant density of their membranes shows them as probably at variance to other cellular membranes. They are specific structures with definite selective value. Perhaps gas-vacuole formation in dim light causes a cell or colony to rise; inhibition of gas-vacuole formation, and continued growth and cell division nearer the surface subsequently causing it to become heavier and sinking. This up and down movement would contribute to maximum absorption of mineral nutrients. Near the surface light inhibition of photosynthesis may result in inability to 'dilute out' the gas-vacuoles by growth, thus the alga remains floating and becomes moribund. Copper sulphate usage for control of myxophycean water-blooms is questionable. Inhibiting formation of these gas-vacuoles or their destruction by ultrasonic radiation, or other means, might effectively control the nuisance. Artificial circulation may break down chemical stratification in the water. (Jones-Wisconsin)

PERIPHYTON GROWTH ON ARTIFICIAL SUBSTRATES IN A RADIOACTIVELY CONTAMINATED LAKE,
Oak Ridge National Lab., Tenn. Radiation Ecology Section.
Ernest C. Neal, Bernard C. Patten, and Charles E. DePoe.
Ecology, Vol 48, No 6, p 918-924, 1967. 1 fig, 1 tab, 17 ref.

Descriptors: *Periphyton, *Radioactivity, *Lakes, Productivity, Radioisotopes, Temperature, Depth, Bacteria, Slime, Algae, Cyanophyta, Diatoms, Chlorophyta, Light intensity, Succession, Zinc radioisotopes, Cesium, Cobalt radioisotopes, Seasonal, Radiochemical analysis, Monitoring, Pigments, Phytoplankton, Waste water (Pollution), Photosynthesis, Chlamydomonas, Chlorella, Euglena, Scenedesmus, Protozoa, Nematodes, Surfaces.
Identifiers: *Growth dynamics, *Bacterial colonization, *Artificial substrates, *Radionuclide accumulation, Ruthenium-106, White Oak Lake (Tenn), Activity-density, Vertical, Microcystis, Oscillatoria, Navicula, Cymbella, Lyngbya, Fragilaria, Oedogonium, Spirogyra, Chaetophora, Stigeoclonium, Ankistrodesmus, Aphanocapsa, Chroococcus, Closterium, Gleocapsa, Spirulina, Ulothrix, Chironomids, Melton Hill Dam (Tenn), Cobalamin.

Periphyton colonization, biomass development and radionuclide accumulation were studied by suspending polyethylene tape vertically for periods to 9 weeks in a radioactively contaminated lake. Biomass growth was nearly complete on upper tape sections after 2 weeks, but full development on lower sections took longer; maximum biomass occurred at 25.4 to 50.8 centimeters depth. Blue-greens were initial algal dominants, succeeded by diatoms and filamentous greens. Species succession continued beyond biomass equilibrium, with blue-greens important in deeper zones and greens developing best in upper, lighted regions. Radioisotope concentrations equilibrated rapidly in both artificial substrates and periphyton biomass. Zinc-65 was concentrated highly by the polyethylene tape, Cesium-137 moderately, and Cobalt-60 and Ruthenium-106 negligibly, if at all. Ambient concentrations of zinc-65 in water and periphyton were below detection. The other isotopes contributed about equally to biomass radioactivity. Biomass activity-densities of Ruthenium-106 and Cesium-137 increased slightly with depth; this pattern was pronounced for Cobalt-60. Factors considered to account for observed vertical distributions include: different radioisotope concentrations in surface and deep water; a hyperbolic rather than linear relationship between activity-density and biomass; and concentration of Cobalt-60 by blue-green algae as an essential element, or by microbiota for use in cobalamin synthesis. (Jones-Wisconsin)
W70-04371

PRIMARY PRODUCTIVITY IN THE GULF OF CALIFORNIA,
Scripps Institution of Oceanography, La Jolla, Calif; and California Univ., San Diego, La Jolla. Inst. of Marine Resources.
B. Zeitzschel.
Marine Biology, Vol 3, No 3, p 201-207, 1969. 3 fig, 2 tab, 33 ref.

Descriptors: *Primary productivity, *Water analysis, Photometry, Analysis, Light penetration, Phytoplankton, On-site tests, Laboratory tests, Ocean circulation.
Identifiers: *Carbon-14, *Research cruise, *Baja California, Submarine photometer, Upwelling, Tidal mixing, Gulf of California, Bay of Bengal, West African coast.

Primary productivity in the Gulf of California was investigated at 34 sampling stations during 6 cruises. Inoculation of water with carbon-14 at various depths and incubation for 1/2 a solar day revealed a considerably higher primary productivity than that of oceans at comparable latitudes. The Gulf exhibits four zones with mean values ranging from 0.272 grams carbon/square meter per day to 0.677 grams carbon/square meter per day. The average integrated rate of primary production from all stations is 0.382 grams carbon/square meter per day (0.002 to 0.932). This high productivity is comparable to that of the Bay of Bengal, the upwelling areas off the west coast of Baja California, or North Africa; it is two to three times greater than the productivity of open Atlantic or Pacific Oceans at similar latitudes. The recorded rate of primary productivity is in part due to seasonal upwelling down to shallow thermocline and to tidal mixing. (Wilde-Wisconsin)
W70-04374

LIFE ON A DYING LAKE,
Peter Schrag.
Saturday Review, p 19-21, 55-56, September 20, 1969. 3 photos.

Descriptors: *Lake Erie, *Great Lakes, *Eutrophication, *Water pollution, *Water pollution effects, Water pollution control, Water pollution sources, Water law, Recreation, Chlorination, Beaches.
Identifiers: *Lake Erie basin, Cuyahoga River (Ohio), Iron III, Ferric iron, Maumee River, Cleveland (Ohio).

A look at Lake Erie's pollution problems shows the conflicts between the social, economic, and political viewpoints. Erie has aged 15,000 years in the past 50 years, but the questions surrounding the cleanup concern resources, priorities, and the urgency, thus leaving the thirteen million people dependent on the lake in limbo. City sewers, industrial wastes, and runoff provide the input, while algae, low oxygen levels, smell, trash fish, river fire, and the necessity to chlorinate beaches are some results. There is fear that the Iron III compound keeping algae nutrients trapped on the lake bottom is being dissolved, which would result in sharply increased eutrophication if the nutrients are released. The cities have not corrected their sewage pollution before demanding that the states enforce anti-pollution standards, leaving federally conducted enforcement conferences to encourage the five lake-region states to commit themselves to remove 80% of the primarily detergent-oriented phosphates by waste treatment. Pollution law shows it's hard to demonstrate a connection between discharges and damages. 'Whose rights are affected', 'Whose environment is it', and 'Who controls the environment' are some of the basic questions approached. (Powers-Wisconsin)

SEASONAL TRENDS IN PHYSICOCHEMICAL FACTORS AND PLANKTON OF A FRESHWATER FISHPOND AND THEIR ROLE IN FISH CULTURE,
Madurai Univ. (India) Dept. of Zoology.
R. George Michael.
Hydrobiologia, Vol 33, No 1, p 144-160, 1969. 13 fig, 47 ref.

Descriptors: *Fish, *Ponds, *Physicochemical properties, Zooplankton, Phytoplankton, Crustaceans, Protozoa, Phosphates, Rotifers, Hydrogen ion concentration.
Identifiers: *India, Barrackpore (India), Fish culture.

A two-year study of seasonal variations in physicochemical properties was made on an 817.5 square meter freshwater pond. Water level varied from 1.9 to 2.6 meters depth, fluctuations due to alternate dry and monsoon seasons. Total alkalinity was inversely related to rainfall; phosphorus concentration was directly related to rainfall although modified by phytoplanktonic utilization. Range of temperature variation was about 19C; minima (14C) occurring in December, maxima (33C) occurring in June-July. Fluctuations in pH and dissolved oxygen did not conform to any seasonal trend. Carbon dioxide concentrations were directly correlated with amount and nature of biological activity. Protozoan populations were low except for peritrich ciliates in the second year of the study. Phytoplankton peaks (mainly flagellates) occurred in December to April; peaks of rotifer and planktonic crustacean populations occurred from February to April. Size of rotifer populations was correlated with high total alkalinity and temperature. Dissolved oxygen, carbon dioxide, and total alkalinity concentrations occur in ranges compatible with high fish yield. (Voigtlander-Wisconsin)

DISTRIBUTION OF CYANOPHAGES IN NATURAL HABITATS,
E. Padan, and M. Shilo.
Verhandlungen der Internationalen Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 747-751, November 1969. 2 tab, 7 ref.

Descriptors: *Viruses, *Ecological distribution, Biocontrol, Water pollution, Cyanophyta, Aquatic habitats, Eutrophication, Lakes, Photosynthesis, Dialysis.
Identifiers: *Cyanophages, Lyngbya, Plectonema, Phormidium, Microbial ecology, Israel, Beith Shean (Israel), Fish ponds, Lake Kinnereth (Israel), Species specificity, Plectonema boryanum, Seasonal effects, Biotopes, Schizothrix calcicola, Plaque-forming-units assay.

First described in 1963, a virus which lyses cyanophytes (blue-green algae), called 'cyanophage' because of its similarity to bacteriophages, is highly specific for algal genera: Lyngbya, Plectonema, Phormidium. It is commonly found in sewage waters. Since then, viruses attacking other cyanophytes have been isolated. Distribution of the organisms in Israeli water sources, and their variations with fluctuations in host populations were studied. Filtered samples (3 liters) were concentrated to 10 milliliters by dialysis, and the dialysate passed through ultrafine filter which passes virus particles. Clearing of a growing algal culture, when incubated with ultrafiltrate, indicates presence of cyanophages; these can be assayed quantitatively by counting plaques, each resulting from a single virus particle, which are formed when test mixture is incubated with agar culture of algae. Five samples from Lake Kinnereth, and over 90% of 40 samples from fish ponds contained phages specific for Plectonema. In 5 ponds, concentrations of cyanophages were in 1-13,000 particles/liter range, peak concentrations corresponding with development of cyanophyte blooms. Susceptible algae are not always isolatable from aquatic habitats where virus is found. Numbers of cyanophate-sensitive algae and concentrations of their viruses are apparently in a state of dynamic equilibrium. (Eichhorn-Wisconsin)

BACTERIAL UPTAKE OF ORGANIC SUBSTRATE: NEW METHODS OF STUDY AND APPLICATION TO EUTROPHICATION,
North Carolina State Univ., Raleigh. Dept. of Zoology.
John E. Hobbie, and Claude C. Crawford.
Verhandlungen der Internationalen Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 725-730, November 1969. 3 fig, 1 tab, 10 ref.

Descriptors: *Aquatic bacteria, *Organic matter, *Eutrophication, *Analytical techniques, Ecosystems, Aquatic habitats, Water pollution effects, Physiological ecology, Respiration, Carbon radioisotopes, Kinetics, North Carolina, Carbonates, Ponds, Regression analysis, Trophic level, Oligotrophy, Lakes, Estuaries, Sewage effluents, Rivers.
Identifiers: *Heterotrophy, Microbial ecology, Carbon-14, Michaelis-Menten equation, Turnover times, Uptake velocities, Millipore filtration, Glucose, Raleigh (NC), Aspartic acid, Hypereutrophy, South Creek (NC), Pamlico River (NC), Relative heterotrophic activity, Scintillation counting.

Methods for application of Michaelis-Menten kinetics to estimate parameters in bacterial assimilation of radiocarbon-labeled organic solutes from natural waters, described earlier, underestimate heterotrophic potential because they fail to consider loss of radioactivity in respired carbon dioxide. These errors are substantial and must be accounted for. Methods are described which accomplish incubation in presence of radioactive substrate in closed vessels. Respired carbon dioxide is absorbed on phenylethylamine-saturated chromatographic paper. After incubation, plankton are filtered onto membrane filter (0.5 micron pore size). Carbon-14 of both filter and absorbing paper is assessed by liquid scintillation counting. As test of methods, water from a small dairy farm pond was incubated with added radioactive glucose and aspartic acid. Corrected data, fitted by computer to Lineweaver-Burk plots, yielded straight lines, indicating that a transport system is operational in uptake. Fit for corrected data is better than for uncorrected. With glucose, mean of 28.9% radioactivity was respired (range for 8 samples: 28.3-32.4%); with aspartic acid, as much as 63.8% is respired. The Wright-Hobbie analysis was previously applied to lakes. Data are presented to demonstrate its application to rivers. Glucose uptake is stimulated at points of introduction into an estuarine river of sewage effluents and wastes from phosphate-mining. (Eichhorn-Wisconsin)

SOME PROBLEMS REMAINING IN ALGAE CULTURING,
Station d'Hydrobiologie Appliquee, Le Paraclet par Boves (France).
A. G. Wurtz.
Algae and Man, Jackson, Daniel F (editor), Plenum Press, New York, p 120-137, 1964.

Descriptors: *Analytical techniques, *Algae, *Growth rates, *Bioindicators, *Water pollution, *Waste treatment, Food chains, Chlorella, Chlorophyll, Physiological ecology, Cyanophyta, Eutrophication, Nuisance algae, Nitrogen, Phosphates, Hydrogen ion concentration, Cycling nutrients, Mud-water interfaces, Euglenophyta, Toxicity, Bioassays, Diatoms, Euglena, Sphaerotilus.
Identifiers: *Algal cultures, *Axenic cultures, Pediastrum, Self-purification, Algal enumeration, Scenedesmus, Growth equations, Ankistrodesmus, Heterotrophy, Continuous cultures, Chlamydomonas, Batch cultures, Optical density, Soil-water techniques, Phycology, Microcystis, Glocotrichia, Aphanizomenon, Micronutrients, Dinophyceae, Cryptophyceae, Chromatium, Oscillatoria, Antibiotic treatment, Chu's medium, Ultraviolet sterilization, Constructive synecology, Tabellaria.

Numerous problems exist among the interfaces between pure-culture study of algae and phycological ecology, especially as regards the quality of man's environment. While attainment of axenic cultures is, of itself, a valid goal, increasing use of such cultures, coupled with ecological insights, may yield useful information pertaining to many perplexing practical problems. Equations describing relationships among growth, yield, and biomass in batch and continuous cultures are reviewed, as are methods for evaluating algal growth. There remains a basic need for standardized techniques for assessing growth in algal cultures. Some aspects of techniques for axenic culturing are reviewed. Discrepancies between information on mineral nutrition of blue-green algae, as developed from studies of axenic cultures, and field observations of conditions leading to nuisance blooms need further study and clarification. The soil-water technique, which has been instrumental in successful culturing of some 500 strains of various algae, raises further ecological questions, including those of heterotrophy and conditions at the soil-water interface. Other similar questions considered in some detail in this report include influence of innoculum size on population growth; ecological implications of algal culture; self-purification of wastes by algae; algal indicators of water quality; and role of algae in food chains. (See Vol. 2, No. 19, Field 5C, W69-07832). (Eichhorn-Wisconsin)

EFFECTS OF ENRICHMENT IN MATHEMATICAL MODELS,
Michigan Univ., Ann Arbor.
Frederick E. Smith.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, D C, 1969. p 631-645. 5 fig.

Descriptors: *Eutrophication, *Mathematical models, *Systems analysis, Water pollution effects, Ecosystems, Simulation analysis, Analytical techniques, Computer models, Trophic level, Aquatic populations, Cycling nutrients, Food webs, Productivity, Predation, Herbivores, Aquatic plants, Organic matter, Growth, Numerical analysis, Detritus, Stochastic processes, Digital computers.
Identifiers: *Enrichment, IBM 7090, Michaelis-Menton equation, Feeding ability, Growth capacity, Inherent losses, Conversion efficiency, Decomposers, Nutrient limitation, Energy limitation, Rutte-Kunga methods, Rate processes.

Ecosystems are as complex as other highly intricate systems which have been adequately modeled, although levels of interest and resources in ecology may be inadequate to attain such modeling. Systems analysis does not require complete models, simplified versions often yielding meaningful insights into operation of dominant influences in actual systems. Simplified ecosystems of 3 or 4 trophic levels and a nutrient pool are describably by models which consider feeding ability, growth capacity, inherent losses, and conversion efficiency. Model for 3 populations has 12 parameters; that for 4, has 17. Models are analogous with Michaelis-Menton equation describing enzyme-saturation kinetics. Development of equations characterizing rate processes, into which stochastic processes were introduced, permitted systems simulation on computer (IBM 7090). Simulations suggest that effects of eutrophication may be systems effects which are independent of species composition, and that some accepted ecological concepts are challengeable. Behavior of models raises important ecological implications including--among others: Parameters in addition to those considered here control ecosystem stability, since population growth tends to cause oscillation to extinction; derivation of food-web stability from diversity is not supported; enrichment of system with mineral nutrients can cause flora to change to a less nutritious type. (See Vol. 3, No. 10, Field 5C, W70-03975). (Eichhorn-Wisconsin)

EVALUATING NUTRIENT SUPPLIES FOR THE GROWTH OF AQUATIC PLANTS IN NATURAL WATERS,
Wisconsin Univ., Madison. Dept. of Botany.
G. C. Gerloff.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, D C, 1969. p 537-555. 4 fig, 8 tab, 32 ref.

Descriptors: *Nutrient requirements, *Aquatic plants, *Water, Lakes, Streams, Carbon radioisotopes, Nitrogen, Phosphorus, Indicators, Soils, Bioassay, Surfaces, Iron, Nitrates, Phosphates, Chemical analysis, Wisconsin, Cultures, Trace elements, Hydrogen ion concentration, Cyanophyta
Identifiers: *Growth, Tissue analysis, Index tissues, Critical concentration, Field-plots, Microcystis aeruginosa, Lake Mendota (Wis), Physiological age, Vallisneria americana, Ceratophyllum demursum, Heteranthera dubia, Elodea occidentalis, Lake Monona (Wis), Najas flexilis, Zannichelia palustris, Lake Waubesa (Wis), Potamogeton.

No procedure for evaluating nutrient supplies and detecting growth-limiting factors in lakes and streams has been developed for general reliability and usefulness. The tissue-analysis procedure gives promise of being very useful in studies of aquatic environments. In an single analytical value, it provides for an integrated expression of availabilities of an element in various parts of a lake or stream from which an organism absorbed nutrients during growth. Many of sampling problems associated with the continual movement and shifting of the aquatic environment thus can be minimized. Enrichment cultures using carbon-14 to measure photosynthetic and biological activity appear somewhat more complex than tissue analysis. Among the problems in need of immediate study are: determining the most appropriate plant parts to sample and analyze; whether analysis for the total content of each element or for an extracted fraction more reliably correlates with yield; the critical concentrations for various species; whether certain species are particularly reliable indicators of water fertility--whether they would serve as indicator plants; the most reliable procedures for collecting plant samples in a particular body of water; the critical concentrations of essential elements, other than nitrogen and phosphorus, in several of the most important aquatic species. (See Vol. 3, No. 10, Field 5C, W70-03975). (Jones-Wisconsin)

GEOCHEMISTRY OF EUTROPHICATION,
General Dynamics Corp., Groton, Conn. Electric Boat Div.
Richard J. Benoit.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, D C, 1969. p 614-630. 3 fig, 6 tab, 30 ref.

Descriptors: *Geochemistry, *Eutrophication, *Water structure, Atmosphere, Sea water, Fresh water, Sorption, Sodium, Algae, Phosphorus, Trace elements, Plankton, Lakes, Rivers, Great Lakes.
Identifiers: *Equilibrium model, Lithosphere, Sorption reactions, Solubility equilibrium theory.

The tendency of the land-based hydrosphere to attain similar composition under the combined influences of the buffering action of ion-exchange reactions and integration of tributaries is stressed. The equilibrium model, based on solubility equilibria of common constituents of the lithosphere and carbon dioxide concentration equal to 35,000 atmospheres, gives a reasonably satisfactory agreement with the actual composition of water of the Great Lakes. While sorption reactions may cause some deviations from the equilibrium models, the major discrepancies in the chemical composition of waters are attributed to man's activity. This is particularly true of the contents of sodium and phosphorus, the two elements that may limit or unduly promote the algal growth. Trace

elements may also alter the trophic level of a lake to create a nuisance or even lead to a degradation of a resource. (See Vol. 3, No. 10, Field 5C, W70-03975). (Wilde-Wisconsin)

NUTRIENTS IN THE POTOMAC RIVER BASIN,
New York State Department of Health, Albany. Div. of Environmental Health Services.
Norbert A. Jaworski, Orterio Villa, Jr., and Leo J. Hetling.
FWPCA, Chesapeake Technical Support Laboratory, Technical Report No 9, May 1969. 40 p, 15 fig, 5 tab, 8 ref.

Descriptors: *Nutrients, *Eutrophication, *River basins, Agricultural wastes, Phosphates, Phosphorus compounds, Nitrogen compounds, Streamflow, Land use, Surface runoff, Mathematical models, Estuaries, District of Columbia, Chlorophyll, Regression analysis, Chlorella, Pennsylvania, Chlamydomonas, Maryland, Cyanophyta, West Virginia, Chlorophyta, Virginia, Biomass, Sampling, Nutrient cycling, Industrial wastes, Nitrites, Nitrates, Ammonia, Water pollution.
Identifiers: *Potomac River, Urban runoff, Seasonal effects, Washington (D C), Chlorophyll a, Predictive equations, Algal blooms, Anacystis, Water quality management, Sub-basins, Hydrographs, Isopleth diagrams, Nitrogen forms, Phosphorus forms, Nutrient loading.

The Potomac River system drains some 14,670 square miles of forested, agricultural, industrialized, and urbanized areas, in December 1968 receiving 382 known discharges. Basinwide studies were undertaken of water quality management, emphasizing eutrophication. In 1966, these studies yielded following estimates of average nutrient loading (in pounds/day) to surface waters of Potomac: phosphorus as phosphate (phosphate-P) --94,130; total nitrogen as nitrogen (N) --122,190. Of these loadings, 87% of phosphate-P and 53% of N originates as wastewater discharges. Inorganic N increases, P decreases with increased streamflow in non-tidal waters. Algal blooms, as indicated by concentrations of chlorophyll a, greater than 50 micrograms/liter were observed over 50 miles of upper Potomac estuary during June-October 1968. During months of decreased flow, high concentrations of total Kjeldahl N, nitrates and phosphates in upper estuary are principally attributable to wastewater discharge from District of Columbia metropolitan area. Studies of mass balance and transport, utilizing predictive equations, demonstrate that at steady state flows, 38% of P entering surface waters of upper basin are retained in channel, apparently in sediments and plants. Stability of such retention is not known. (Eichhorn-Wisconsin)

The Galveston Bay estuary's environmental crisis is reported. Long a major nursery area for shellfish and finfish, the bay's water quality has been severely degraded by rapid industrial and population growth. A 1914 decision to build the Houston Ship Channel has had far-reaching environmental effects. The industries and residential subdivisions which have grown up along the channel, dump raw sewage into it. This highly polluted water flows untreated into the Bay. Shelldredging, water diversions and landfill encroachments have severely reduced the nursery marshlands and increased salinity. The U.S. Corps of Engineers proposed Wallisville Dam will further aggrevate these situations, threatening estuarial life. The Houston Lighting and Power Company's new facility will add thermal pollution to the Bay's problems. Traditionally, the Texas state government has been insensitive to the water pollution problems of the state's few industrial-oriented municipalities. Thus, state water quality standards are low, but federally approved, and have never been enforced. The recent federal activity has prompted the hitherto dormant State Water Quality Board to take the offensive for the first time in its history, and the establishment of the Gulf Coast Waste Disposal Authority as a coordinating agency. High concentrations of ciliates and other protozoa are characteristic of decomposing sewage. Water bodies containing living organisms produce natural 'sewage' in form of dead organisms, feces, and dissolved metabolites. Per unit weight, marine protozoa excrete dissolved phosphorus one to two orders of magnitude faster than marine microcrustaceans and several orders of magnitude faster than marine macrofauna. Protozoa may be responsible for a major fraction of faunal nutrient excretion even though only present as a minor fraction of the faunal biomass. Regeneration of dissolved inorganic phosphate from organic detritus proceeds faster and more completely in the presence of bacteria and ciliates or colorless flagellates than in the presence of bacteria alone. An increased consumption of organic detritus in the presence of protozoa is performed by bacteria, which are kept in a prolonged state of 'physiological youth' by grazing protozoa. Present results indicate that it is the protozoa that produce, via excretion, the greater regeneration of nutrients from organic detritus. By constituting a nutrient source for protozoa, bacteria are indirectly involved in the increased regeneration. Bacterial activities greatly influence the pH of sediments and of bodies of water where circulation is restricted. (Jones-Wisconsin)

Identifiers: *Fecal pellets, Palaemonetes pugio, Nitzschia closterium, Sapelo Island (Ga), Gastropods, Fundulus heteroclitus, Nassa obsoleta, Uca pugnax, Pagurus longicarpus, Autolysis, Solution, Euphotic zone.

The role of feces in energy flow and nutrient cycles in the marine ecosystem was examined using fecal pellets of the shrimp Palaemonetes pugio, fed on the diatom Nitzschia closterium. P pugio is extremely abundant in tidal creeks along the Georgia coast. The pellets were rich in organic matter, particularly protein and readily eaten by P pugio when diatoms were not available and assimilation efficiency was high, indicating that the pellets contained substantial absorbable organic matter. Solution and bacterial respiration reduced the organic content of feces while light and dissolved organic matter stimulated the growth of autotrophic and heterotrophic microorganisms. It is estimated that the incorporation rate of organic matter into fecal pellets exceeds the incorporation rate of organic matter into herbivore tissue and that fecal pellets constitute a major potential food source for marine animals. If fecal pellets were to sink quantitatively out of the euphotic zone, the result would be a rapid removal of large quantities of phosphorus from the upper waters. Results suggest two ways in which this loss is minimized: solution of fecal phosphorus and ingestion of fecal pellets and assimilation of phosphorus by zooplankton. (Jones-Wisconsin)

ANNUAL CYCLE, SPECIES DIVERSITY AND SUCCESSION OF PHYTOPLANKTON IN LOWER SARONICOS BAY, AEGEAN SEA,
Democritus Nuclear Research Center, Athens, Greece. Hydrobiology Group.
L. Ignatiades.
Marine Biology, Vol 3, No 3, p 196-200, 1969. 1 fig, 3 tab, 6 ref.

Descriptors: *Cycles, *Succession, *Phytoplankton, Sampling, Diatoms, Light intensity, Phosphates, Grazing, Dinoflagellates, Seasonal, Nutrients, Population, Nitrates, Silicates, Turbulence, Primary productivity, Columns, Stratification.
Identifiers: *Saronicos Bay (Aegean Sea), Diversity index, Asterionella, Asterolampra, Asteromphalus, Bacteriastrum, Biddulphia, Chaetoceros, Cerataulina, Coscinodiscus, Dactyliosolen, Ditylum, Eucampia, Hemiaulus, Leptocylindrus, Licmophora, Nitzschia, Rhabdonema, Rhizosolenia, Skeletonema, Streptotheca, Thalassionema, Ceratium, Thalassiosira, Thalassiothrix, Amphisolenia, Dinophysis, Exuviella, Peridinium.

Annual cycles of diatoms and dinoflagellates in the lower Saronicos Bay, Aegean Sea, are described on the basis of net samples collected during 1967. The annual cycle is largely due to changes in diatom concentrations (cells/liter), while the dinoflagellate concentrations remain constant. A pronounced spring diatom bloom is followed by a quantitative and qualitative decline of diatoms in summer due mainly to high light intensities, phosphorus depletion and extensive grazing. Autumnal diatom increase lasts during the rest of the year; the phase of small diatoms develops incompletely. The theoretical model of species succession is affected by poor

nutritional conditions of the bay. Low species diversity levels prevail during the spring phytoplankton bloom; diversity increases in later succession stages. Results do not suggest any clear limiting effect of nitrate and silicate concentrations on phytoplankton abundance. Dinoflagellates formed a constant component of the plankton at all seasons, but were characterized by their sparsity. The two observed maxima did not total more than 400 cells/liter; in summer and early autumn their occurrence was 20-100 cells/liter. The population was dominated by the Ceratium community throughout the year. (Jones-Wisconsin)
W70-04450

EFFECTS OF CONTROLLED NUTRIENT DILUTION OF A EUTROPHIC LAKE,
Seattle, Wash.
Ray T. Oglesby.
Water Research, Vol 2, p 106-108, 1968. 2 fig, 5 ref.

Descriptors: *Eutrophication, *Lakes, *Nutrients, Recreation, Washington, Cyanophyta, Chlorophyll, Phosphates, Nitrates, Phytoplankton, Primary productivity, Water quality, Standing crop, Alkalinity, Sodium, Molybdenum, Nitrogen fixation.
Identifiers: Green Lake (Wash), Flushing, Transparency, Dilution, Aphanizomenon holsaticum, Flos-aquae, Anacystis, Gleotrichia echninulata, Anabaena circinalis, Dilution water, Seattle (Wash).

Green Lake, located near the center of Seattle, Washington, has an intensive recreational use and represents a valuable resource. To prolong the life of this body of water to improve its quality, large quantities of nutrient-poor water were diverted from the city's potable supply through the lake. In determining the effectiveness of this program, Green Lake has been sampled at least once each month during the winter and two to four times per month during the rest of the year, during a three year period. Chief emphasis has been placed on variations in nutrient levels, transparency, presence of phytoplankton species and primary production levels as related to the addition of large volumes of dilution water. Although the pattern is complex, the trend toward improved conditions is definite. Two postulates are advanced for the decreased eutrophication resulting from the flushing: decrease in availability of primary nutrients, and a decrease in the overall mineral content to a very low level resulting in algal species changes and primary production limitations due to trace element deficiences. Concentrations of nitrate indicate an apparent correlation with the very high productivity peaks exhibited in 1959. (Jones-Wisconsin)

PRELIMINARY STUDIES ON PRIMARY PRODUCTIVITY AT PAYAKONDA, GULF OF KANDALAKSHA, WHITE SEA,
Akademiya Nauk SSSR. Institut Okeanologii.
K. Radhakrishna.
Marine Biology, Vol 3, No 2, p 188-190, 1969. 1 fig, 2 tab, 14 ref.

Descriptors: *Tidal effects, *Tides, *Primary productivity, Phytoplankton, Photosynthesis, Nitrate, Oxygen, Analysis, Light intensity, Insulation, Phosphate.
Identifiers: *High tides, *Low tides, White Sea, Kandalaksha Gulf, Payakonda (White Sea), High Venice Lagoon (Italy), Beaufort Channel.

The primary production in the near-shore, shallow part of the Gulf of Kandalaksha was investigated during late summer by the light and dark bottle method and the use of carbon-14. Sampling of water was confined to the surface and 3-meter depth. Oxygen samples were exposed to light for 24 hours; carbon-14 samples, for 6 hours. Surface insulation was determined with a pyrheliometer and subsurface insulation by a submarine photometer. Radioactivity was measured by an end-window Geiger counter. The oxygen determinations of photosynthesis were about three times as high as those obtained with carbon-14 values. In spite of restricted light penetration to the 3 meter depth, the rate of production in milligrams carbon/cubic meter per day was high. Low tide waters had a higher concentration of nutrients and growth stimulating effect than high tide waters. (Wilde-Wisconsin)

THE FUTURE OF THE LAKE,
Washington Univ., Seattle. Dept. of Zoology.
W. T. Edmondson.
Municipality of Metropolitan Seattle, Metro Quarterly, Fall 1965. 4 p, 1 fig.

Descriptors: *Algae, *Water pollution treatment, Lakes, Sewage, Drainage districts, Debt, Costs, Cities.
Identifiers: *Lake Washington (Wash), Seattle (Wash), Revenue bonds, Metro Act (Seattle).

Originally Seattle, Washington, released non-treated sewage into Puget Sound and treated sewage into Lake Washington. Swimming in the sound was destroyed, and Lake Washington became eutrophic. The Metro Act enacted in 1957 provided for the establishment of a metropolitan municipal corporation with the power to perform sewage disposal, water, parks, transportation, comprehensive planning and/or garbage disposal. In 1958 the sewage disposal proviso was approved by 60% vote. July 1966 should see the end of sewage discharge into Lake Washington. $120 million in revenue bonds have been sold to date, to be repaid by a $2 monthly charge per residential connection and a $2 monthly charge per 900 cubic feet of water used by industrial and commercial enterprises. Prompt improvement in the lake is expected within a few years after final diversion in 1966 as the watershed is relatively poor in dissolved minerals including nutrients needed by algae, and as there are no massive deposits of accumulated soft sediments on the lake bottom rich in nutrients available to algae, the prognosis is good for the recovery of Lake Washington. (Powers-Wisconsin)

EUTROPHIC EFFECTS AT THE MOUTH OF A GREAT RIVER (GRAND RHONE) (IN FRENCH),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
F. Blank, M. Leveau, and K. H. Szekielda.
Marine Biology, Vol 3, No 3, p 233-242, 1969. 19 fig, 4 tab, 13 ref.

Descriptors: *Eutrophication, *Rivers, Salinity, Temperature, Nutrients, Gulfs, Phytoplankton, Zooplankton, Chlorophyll, Seston, Organic matter, Brackish water, Fresh water, Sampling, Phosphates, Nitrates, Biomass, Fish, Winds, Precipitation (Atmospheric), Currents (Water), Marine plants, Benthic flora, Dinoflagellates, Diatoms, Copepods, Mollusks, Crustaceans, Chordates.
Identifiers: *Mouth, *Rhone (France), Mediterranean Sea, Marseilles (France), Port Saint-Louis (France), Coriolis (France), Provence (France), Chaetoceros curvisetus, Nitzschia closterium, Radiolaria, Tintinnida, Cladocerans, Paracalanus parvus, Acartia clausi, Centropages typicus, Evadne spinifera, Podon polyphemoides, Coelenterata, Chaetognathes, Decapod larvae, Penilia avirostris, Conchoecia spinirostris, Creseis acicula.

A study of hydrographical and biological parameters in surface waters near the mouth of the Rhone River was made. Salinity, temperature and nutrient salts have been recorded, and phytoplankton, together with zooplankton, quantitatively and qualitatively analyzed. Chlorophyll a, seston, and organic matter concentration had been determined. The hydrographical structure near the Rhone is heterogenous and biological results are difficult to explain on the basis of hydrographical parameters. The numerical data of zooplantkton in the area are 10 times higher than in the Mediterranean Sea. Major composition of zooplankton is copepods and cladocerans, with Paracalanus parvus and Acartia clausi the dominant species. There is a great abundance of brackish and fresh water phytoplankton in the dilution zone, but these cells are dead or almost dead, coinciding with the low concentrations of chlorophyll a. The temperature and salinity show the hydrologic complexity. The Rhone's fresh water runs into neritic water, influencing a strong dilution zone on both sides of the main current, gradient being stronger at the east than west. Line of demarcation between the zones is a veritable frontier where the salinities quickly change from 10 to 37 parts/thousand. (Jones-Wisconsin)

Bulletin of Marine Science, Vol 17, No 3, p 576-596, 1967. 5 fig, 3 tab, 21 ref.

Descriptors: *Investigations, Yeasts, Molds, Density, Depth, Fungi, Sampling, Hydrography, Atlantic Ocean, Indian Ocean, Thermocline, Hydrogen sulfide, Distance, Sedimentation.
Identifiers: *Mycological, *Black Sea, Debaryomyces hansenii, Candida diddensii, Rhodotorula, Rhodotorula glutinis, Hyphomycetes, Cladosporium herbarum, Cladosporium cladosporioides, Aureobasidium pullulans, Physiological characteristics, Morphology, Current boundaries, Hansenula jadinii, Cryptococcus, Torulopsis, Sporobolomyces, Taphrina, Alternaria, Aspergillus, Nigrospora sphaerica, Fusarium oxysporum, Cephalosporium, Papularia sphaerosperma.

The Black Sea basin, generally devoid of vertical equalizing currents, is characterized by a decrease in oxygen with increasing depths. Its peculiar hydrochemical nature makes it an excellent locale for evaluation of distribution parameters and activity of specific fungal taxa. A collection of 558 molds and yeasts from the Black Sea has been characterized and population densities established. Of 174 water samples taken, 84 were positive for yeasts, while 97 contained molds. Average yeast density was less than 10 cells/liter while densities in excess of 20 cells/liter were found in only six samples. The maximal yeast population was 150 cells/liter. Decrease in incidence, density, and average number of yeast species was noted with increasing depth. Predominant taxa included the yeasts, Debaryomyces hansenii, Candida diddensii, Rhodotorula rubra, and Rhodotorula glutinis, and the hyphomycetes, Cladosporium and Aureobasidium pullulans. Generally, low concentrations of fungi prevented definitive correlation of individual species distribution with hydrographic aspects. Comparison of data with those obtained in earlier yeast studies in the Black Sea suggests that the previous information, and generalizations derived therefrom, must be critically re-evaluated. CHANGES IN METAL COMPOSITION OF THE QUAHAUG CLAM, MERCENARIA MERCENARIA, AFTER EXPOSURE TO INSECTICIDES,
Bureau of Sport Fisheries and Wildlife, Highlands, N.J. Fish-Pesticide Research Lab.
Ronald Eisler, and Melvin P. Weinstein.
Chesapeake Science, Vol 8, No 4, p 253-258, 1967. 2 fig, 2 tab, 18 ref.

Descriptors: *Metals, *Insecticides, *Water pollution effects, Organophosphorus pesticides, Chemical analysis, Sodium, Potassium, Magnesium, Iron, Calcium, Zinc, Bioindicators, Environmental effects, Clams, Estuaries, Physiological ecology, New

Jersey, Bioassays, Toxicity, Fish, Crustacea, Trace elements.
Identifiers: *Chemical composition, *Quahaug clam, *Mercenaria mercenaria, Methoxychlor, Malathion, Organochloride pesticides, Raritan Bay (NJ), Anguilla, Fundulus, Mugil, Sphaeroides, Menidia, Palaemonetes, Crangon, Pagurus.

Estuarine faunas are particularly susceptible to deleterious effects of chemical pesticides because such compounds, disseminated from drainage systems, tend to accumulate in estuaries. A variety of pesticide-induced disturbances of physiology and behavior have been demonstrated for various marine organisms. Adult quahaug clams were subjected to graded concentrations of insecticides, Malathion (organophosphorus) and methoxychlor (organochloride), for 96 hours under standardized conditions (24/mill salinity; 20C; aeration; daily light cycle: 10 hours at 25 foot-candles, 14 hours darkness). Clams appeared normal at highest concentrations (parts/billion) tested: Malathion--37,000; methoxychlor--1,100. Quahaugs are more resistant to these insecticides than are many marine fishes and crustaceans, for which toxicity data are presented. Exposed clams, removed to uncontaminated medium, survived at least 133 days post-exposure, apparently unaffected by treatment. Metallic composition of whole animals and selected tissues (gill, mantle, muscle) were analyzed by atomic absorption spectrophotometry. Profiles, presented as shifts in composition, between control and experimental animals, as function of pesticide dose, indicate changes in sodium, potassium, magnesium, iron, and marked changes in calcium and zinc. Such profiles may provide means of identifying unfavorable environmental effects before more drastic changes occur. Disproportionate changes in metallic composition of clams need further study. OUTWITTING THE PATIENT ASSASSIN: THE HUMAN USE OF LAKE POLLUTION,
Northwestern Univ., Evanston, Ill. Technological Inst.
Harold B. Gotaas.
Bulletin of the Atomic Scientists, p 8-10, May 1969.

Descriptors: *Nutrients, *Benefit-cost analysis, *Lake Erie, Phosphorus, Fish stocking, Commercial fish, Salmon, Algae, Fish.
Identifiers: Antipollution programs, Biological balance, Overfishing, Coho salmon, Alewife, Nutrient removal.

Some aspects of the October 1968 Department of Interior report on Lake Erie are challenged. The emphasis on nutrient removal which would result in immediate expenditure of $1.1 billion to control municipal pollution and $285 million for curbing industrial contamination is questioned in light of the expected benefits. Several efficacious alternatives for reviving the Great Lakes are suggested: (1) further nutrient relationships and cost versus benefits studies should be undertaken before money is spent to build expensive treatment facilities; (2) harvest algae as a potential source of food thus preventing it from contributing to the organic waste load; (3) prevent the introduction of all toxic materials enabling desirable biological balances to be established; (4) seed the lakes with desirable fish to establish a food chain which would permit the growth and removal of nutrients as well as fish for food needs and sport; and (5) adopt water quality standards that are realistic as to their costs, benefits, and time priorities. THE ROLE OF CULTURED POND FISH IN THE CONTROL OF EUTROPHICATION IN LAKES AND DAMS,
Fish Culture Research Training Inst., Malacca (Malaysia).
G. A. Prowse.
Verhandlungen der Internationalen Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 714-718, 1969. 15 ref.

Descriptors: *Eutrophication, *Fish farming, *Lakes, *Impoundments, *Water pollution control, Cyanophyta, Fish, Aquatic plants, Herbivores, Environmental effects, Fertilization, Phosphates, Diatoms, Chlorophyta, Nitrogen, Tropical regions.
Identifiers: Helostoma temmincki, Mugil, Hypophthalmichthys molitrix, Tilapia mossambica, Macrophytes, Tilapia zillii, Tilapia melanopleura, Ctenopharyngodon idellus, Grass carp, Lemna, Spirodela, Eichhornia, Pistia, Salvinia, Sedges, Melacca (Malaysia), Malaya, Anabaena inaequalis, Anabaenopsis raciborskii, Anabaena flos-aquae, Anabaena spiroides, Microcystis acruginosa, Silver carp, Calothrix, Aphanizomenon flos-aquae, Oscillatoria, Oedogonium, Planktophage fishes, Ceratium.

Less desirable enrichment effects of the hydrosphere with plant nutrients include excessive growths of various aquatic macrophytes, and of algae, usually blue-greens. In certain situations, introduction of cultured pond fishes offers a means of controlling those manifestations of eutrophication. Criteria for suitable candidates include: (1) fish should be planktophagous or herbivorous; (2) they should not create a nuisance by spreading; (3) they must co-exist peacefully with other species without detriment to latter; (4) they must maintain their numbers in face of predation; and (5) they must tolerate existing temperature conditions. Among suitable choices of macrophyte-feeders are Tilapia zillii, T melanopleura, and the grass carp, Ctenopharyngodon idellus. Tilapia will not tolerate temperatures below 10C, but are very fecund under tropical conditions. Ctenopharyngodon has wide temperature tolerance, but its spawning must be induced artificially with pituitary injections. Suitable planktophages include Tilapia mossambica and related species, and silver carp, Hypophthalmichthys molitrix. These Tilapia do not thrive below 13C, but spawning of silver carp is easier than with Ctenopharyngodon. Combinations of planktophages and herbivores are often desirable. In eutrophic brackish lakes, like Lake Onondaga, New York, various mullets (Mugil) might be suitable planktophages. (Eichhorn-Wisconsin)

ALGAE FROM WESTERN LAKE ERIE,
Ohio State Univ., Columbus. Dept. of Botany and Plant Pathology.
Clarence E. Taft, and W. Jack Kishler.
Ohio Journal of Science, Vol 68, No 2, p 80-83, 1968. 9 fig, 7 ref.

Descriptors: *Algae, *Lake Erie, Chlorophyta, Cyanophyta, United States, Habitats.
Identifiers: *New species, *Western Lake Erie (Ohio), Gongrosira stagnalis, Nephrocytium obesum W and G S West, Radiococcus nimbatus, Uronema elongatum Hodgetts, Chroococcus prescottii, Calothrix fusca, Microcoleus lacustris (Rab) Farlow, Cladophora, Taxonomic descriptions, Gongrosira lacustris Brand, Gongrosira debaryana Rab, Oocystis, Oscillatoria, Ulothrix, Eucapsis alpina Clements and Schantz, Scytonema alatum (Carm) Borzi, Scytonema myochrous.

Four species of algae in the Chlorophyta (Gongrosira stagnalis, Nephrocytium obesum, Radiococcus nimbatus, and Uronema elongatum) and five in the Cyanophyta (Chroococcus prescotti, Calothrix fusca, Microcoleus lacustris, Scytonema alatum, and Scytonema myochrous) are newly reported for western Lake Erie. Gongrosira stagnalis (G S West) Schmidle, collected from the basal fragments of old Cladophora, appears to be a new record for the United States. Nephrocytium obesum W and G S West, which is reported as often having a shallowly scrobiculate wall, is unique and merits further intensive study. These new algae occasionally appear in teaching and research collections at Stone Laboratory, Put-in-Bay, Ohio. The habitat of G stagnalis on calcium-encrusted Cladophora filaments is unique. HEMATOLOGICAL ASPECTS OF THE THERMOACCLIMATORY PROCESS IN THE RAINBOW TROUT, SALMO GAIRDNERI,
Marquette Univ., Milwaukee, Wis. Dept. of Biology.
Mary Anne DeWilde, and A. H. Houston.
Journal, Fisheries Research Board, Canada, Vol. 24, No. 11, p. 2267-2281, Nov. 1967. 2 fig., 2 tab., 31 ref.

Descriptors: *Temperature, *Oxygen demand, *Acclimatization, *Rainbow trout, Fish.
Identifiers: Erythrocyte abundance, Hemoglobin concentrations, Mean erythrocytic volume and hemoglobin content.

The blood oxygen capacity of the rainbow trout has been investigated as a function of thermal acclimation in terms of erythrocyte abundance, packed cell volume, hemoglobin concentrations, and mean erythrocytic volume and hemoglobin content. Fish at the lower acclimation temperatures employed (3 deg, 7 deg C) were characterized by relatively low erythrocyte counts, hematocrits, and hemoglobin levels. Mean erythrocyte volumes tended to be relatively high, whereas mean erythrocytic hemoglobin content was somewhat below that typical of the higher temperature groups. In general, animals held at intermediate temperatures (11 deg, 14 deg, 17 deg C) showed significant increases in oxygen-carrying capacity by comparison with cold-acclimated fish. Finally, trout at 21 deg C typically had larger numbers of somewhat smaller red cells, more hemoglobin, and higher levels of hemoglobin per erythrocyte than either the lowor intermediate-temperature fish. Significant differences were observed between summer and fall-winter series of trout, particularly with respect to hemoglobin levels. The results do not indicate that modification in blood oxygen capacity are of major importance in the solution of the temperature-oxygen demand problem. However, there is support for the suggestion that hematological responses which do occur take place in approximately stepwise fashion. (Speakman-Vanderbilt)

INFLUENCE OF POLLUTION ON THE BOTTOM FAUNA OF THE SOUND (ORESUND),
Lund Univ. (Sweden). Dept. of Animal Ecology.
Rolf Henriksson.
Oikos, Vol 20, No 2, p 507-523, 1969. 22 fig, 1 tab, 23 ref.

Descriptors: *Water pollution, *Sound, Sediments, Water chemistry, Oxygen, Indicators, Hydrogen sulfide, Bacteria, Hydrogen ion concentration, Temperature, Salinity, Sewage effluents, Ice, Seasonal, Ammonia, Nitrites, Nitrates, Phosphorus, Invertebrates, Chemical analysis, Domestic wastes, Industrial wastes, Drainage water, Rain, Anaerobic conditions, Eggs, Habitats, Foods, Population, Clostridium.
Identifiers: *Bottom fauna, *Oresund (Sweden), Copenhagen (Denmark), Nereis diversicolor, Scoloplos armiger, Capitella capitata, Ampharete grubei, Terebellides stromi, Macoma balthica, Cardium lamarcki, Mya arenaria, Halicryptus spinulosus, Clostridium perfringers, Escherichia coli, Spio fuliginosa, Tubifex, Azoic area.

Pollution distribution estimates in the Sound (Oresund) between southern Sweden and Sjaelland, have been made based on frequency of indicator organisms. The relationship between sediment, water chemistry, and bottom fauna were investigated as well as the resistance of indicator species to low oxygen contents and hydrogen sulphide and their correlation to bacterial pollution. A narrow azoic zone close to the Sjolunda outlet and a similar zone on the Danish side outside Provesteen are heavily polluted as are the inner part of the Lomma Bay and a large area outside Copenhagen. Almost all the rest of the research area on the Danish side and the outer parts of the Lomma Bay are influenced by pollution with the exception of a small peripheral part of the study area outside Copenhagen. No pollutional influences were noted in small areas on the Swedish side and south of the Isle of Ven. A bottom community of Nereis diversicolor Muller, Scoloplos armiger Muller, Capitella capitata (F), Ampharete grubei Malmgren, Terebellides stromi Sars, Macoma balthica (L), Cardium lamarcki Reeve, Mya arenaria L, and Halicryptus spinulosus v Siebold proved useful in indicating pollution.
